FOREWORD

The new scientific conference, RED 2020, is a successor of former eight GIH symposiums. During these eight years of GIH symposium development we witnessed both the deepening and the widening of research topics and studies that were submitted. We recognized on one hand, a constantly increasing interest for topics relevant not only for region of Eastern Croatia, but also for other Croatian regions as well as for national and international economy. On the other hand, a number of submissions were addressing issues different than only regional development which was emphasized in GIH symposium. We were able to identify number of papers related to microeconomic and entrepreneurial issues. These trends led us to reframe the profile of the conference i.e. to include new areas of scientific interest and thus enable more participant form both Croatia and abroad to join us.

Having altogether 106 accepted papers for publishing, grouped in three broad areas: region, entrepreneurship and development that are coming from different countries other than Croatia: Bosnia and Herzegovina, Serbia, Slovakia, Poland, Portugal, Greece, India, have proven that our efforts were recognized and accepted.

Unfortunatelly, due to corona crisis, our additional efforts in conference preparations had to be cancelled. Nevertheless, our intention is to continue with positive changes and improvements we introduced in 2019: key note speech, PhD workshop, no-print proceedings, best paper award.. your positive feedback was very valuable and motivational for us. We continued with improvements, beside widening the scope of the conference. So for this yeaar we have planned additional workshop for PhD mentors (which had to be cancelled alongside with the whole event).

However, this year we are trying to recognize and encourage excellence – the best paper award brings not only official recognition and certificate but also a fee waiver for author(s)of the best conference paper for RED 2021. And since we had to give up our official diner and formal announcement of the best conference paper, we declare it here and now: the best RED 2020 paper is: Determinants of Firm Profitability in Eastern Croatia, coauthored by Irena Raguž Krištić, Marko Družić and Marija Logarušić, all form Faculty of Economics in Zagreb, Croatia. This paper is a perfect example of integration of all three key areas of scientific interest that RED covers. Congratulations to the authors and we hope to meet them live at RED 2021, with equally interesting paper.

All the participant, same as last year, will receive an USB stick with conference proceedings, printed Book of abstracts and certificates of participation.

Both Organizing and Programme Committees deeply miss our live meeting, discussions and social events that are disabled due to corona crisis. We promise to make it up to all of you (and us) at RED 2021. See you.

INFLUENCE AND SIGNIFICANCE OF WOMEN FOR DEVELOPMENT OF CROATIAN TOURISM

ABSTRACT

In recent years Croatian tourism has been registering tourist records. However, growth of tourist turnover is not accompanied by the new state of development towards which is being striving for, respectively, improving the position of Croatian tourism on the tourist market. Despite the presence of significant investment cycles in Hospitality, and achievement of a specific movement away from a traditional product "Sun and sea" through development of specific forms of tourism and enriching the offer elements on destination level, still present problems in Croatian tourism are being noticed, in particular in expressed seasonality and lack of necessary professional staff. Tourist market is firm, consolidated, with a wide range of possibilities, and provides space for women. In the structure of employees in Croatian tourism the majority are women (56% in December 2018), which is not the case with the society as whole (48,8% in December 2018). The purpose of this research is to provide a thorough assessment of the position of women in Croatian tourism. In terms of methodology, the authors will use desk-research method, respectively, data from the secondary sources in this research. It is expected that the research results will present the level of disproportion of share of female managers in relation to the total number of employed women in Croatian tourism and prove that women can be its new strength through formation of new projects in tourism. It is expected that findings in this paper will contribute towards better understanding of the importance of enabling formation of equal working conditions for both for women and men, with a goal of stimulating women in taking over managerial positions. By maintaining women on low qualified positions, their diverse talents and capabilities remain an unused resource.

Key words: *human resources, women managers, service quality in tourism, development of Croatian tourism.*

1. Introduction

In the Republic of Croatia (further in text Croatia), as well as in many other countries of the world, tourism stimulates the development of the economy through achieved foreign exchange income and formation of direct and indirect employment. The following data from the Croatian

Bureau of Statistics (2020b) indicate that with 19,6 million of tourist arrivals and 91,2 million of tourist overnights in 2019 a record tourist results were achieved and growth from the previous years was continued, although a bit slower as a consequence of the recovery of competitive markets and limiting capacities (8,0% of the average annual growth of tourist arrivals and 5,7% of tourist overnights in the period 2010-2018.). Incomes from tourism participate with more than 18% in the GDP and generate around 8% of workplaces in 2018. By that Croatia is at the same time placed at the very top of EU-28 countries in which tourism is the generator of economic development, improvement of life standard and poverty reduction. Income from tourism participate with 1,2% in EU-28 GDP, and double digits, besides Croatia also have Cyprus (13,9%) and Malta (12,7%) (Eurostat, 2020a). According to the data of Croatian Bureau of Statistics (authors´ calculation according to 2019), every thirteenth company of non-financial business economy in Croatia belongs to the tourism industry, respectively to the activity of providing accommodation and provision and serving food. In 2017, in these 19.911 enterprises 105.607 people were employed. Enterprises with tourist activities participated with 10,3% in total number of employed persons of non-financial business economy and have achieved 4,6% of turnover and 8% of added value according to the costs of production factors of non-financial economy. On the EU-28 level a slightly lower share of tourism enterprises in the non-financial sector (10%) belongs to the tourism industry, and enterprises with the tourism activities employ around 9,5% of persons of total number of employees of non-financial sector and 21,7% of persons in the service sector in 2016. Growth of tourist activities is supported with the increasing placement of loans in the activities of provision of accommodation services and preparation and serving food, and stimulation of development of a activities with the tourist activity through various programs on regional and national level, as well as on the European Union level (especially grants for rural tourism from the IPARD program).

Researches have shown various ways on which tourism can contribute towards economic growth, reduction of poverty and community development (Creaco, Querini, 2003; Spenceley, Mayer, 2012; Snyman, 2012; Marin, 2015 and others). Šutalo, Ivandić and Marušić (2011) recognize problems of measuring tourism, and along with the identified lacks of measuring tourism and the fact that it is not being presented in the national accounts as a separate sector, they set a model of estimate of total contribution of tourism to the Croatian economy based on Input-Output Model and connected with the satellite account of tourism by a structural matrix of total inter-phase flows and data about the tourism consumption. For the year 2016, Tourism Satellite Balance (TSA) confirmed an exceptionally high significance of tourism for total National Economy through direct and indirect effects by estimating total contribution of tourism to the gross domestic value of Croatia of 16,9%, and participating of gross domestic value of tourism and connected activities in the total gross added value of national economy is 24% (Institute for tourism, 2019). It is also necessary to point out how in the last few years reduction of industrial manufacturing as well as giving guarantees of the state for shipbuilding had a significant influence on increase of importance of tourism for the national economy. Development of Specific forms of tourism in Croatia contributed towards placing into focus research of effects of certain tourism forms on motivation for choosing a tourist destination, increase of out-of-board consumption and enhancing diversity and quality of tourist offer and similar (Škorić, 2008), influence of commercialization and commodification of culture on destination´s authencity (Dujmović, 2019), and greater and greater attention is being given to the tourism research in the context of climate changes (Šverko Grdić and Špoljarić, 2018) and sustainable development as a factor of competitiveness of Croatian tourism (Sunara et al., 2013). By promoting the policy of sustainable tourism workplaces are being formed and local culture and products are being promoted. Less attention is being given to the inequality of distribution of benefits of tourism among genders. Tourism has a key role in achieving set goals of the Agenda for sustainable development until 2030 brought on the 69th Meeting of the

Assembly of United Nations in 2015 which also includes obligations concerned with achieving gender equality and strengthening of women on global, national and regional level (General Assembly, 2015).

Tourist market is firm, consolidated and with a wide variety of possibilities both for formal and informal employment. Jobs in tourism are being characterized by flexibility and possibility of its organization in various places, within the business subject, community and household. Tourism forms a wide spectre of possibilities for women within a complex value chain which is formed in the destination´s economy (UNWTO, 2011). It provides the space suitable for the increase of employment of women, reduction of poverty, increase of independence and strengthening of women within the community. This especially relates to the less developed regions. In tourism women are taking different roles, from managers, innovators, owners of business subjects, household renters, animators, teachers, guides and finally participants in tourism activities. However, despite the high level of employment of women in tourism, only a smaller number of them is employed on managerial or high qualified positions. The majority of women is still employed on lower positions on which they have lower income, although they are frequently more educated in the relation to their colleagues on the same workplaces. World regions are different considering the disproportion in gender equality.

The purpose of this research is to enable a thorough assessment of position of women in Croatian tourism, and their influence and significance for development of Croatian tourism. By following UNWTO researches "Women in tourism" in years 2010 and 2019, the research is focused on the areas covered by the global research: employment, entrepreneurship, education and training, leadership, politics and making decisions and community and civil society. Research results are trying to point out the disproportion of share of women managers in relation to the total number of employed women in Croatian tourism and prove that women can be a new force of Croatian tourism by forming new projects in tourism. For the purpose of this paper the authors will use the data obtained from the secondary sources.

2. Women in tourism of the Republic of Croatia

2.1. The analysis of employment of women in Croatian tourism

Tourism is the generator of employment in Croatia. According to the data from the Croatian Bureau of Statistics (2020a), in 2018 tourism activities[1] employed totally 118.081 of employees, and in a ten-year period (from 2010) their number has been increased for 29.000. Dynamic growth of tourist turnover and significantly greater demand for employees in tourism in relation to the other economic activities have resulted in an increase of share of employees in tourism in total number of employees in the Republic of Croatia with 6,2% in 2010 to 7,8% in year 2019. In part, this also influenced on the reduction of the unemployment rate to 9,2% in 2018 from the record 20,2% in 2013. In total number of employed women in the Republic of Croatia, women in tourism participate with 8,9% with the tendency of increase in the period from 2010 when they participated with 7,4%. In general, women are well represented in the structure of employees in tourism with 54,7% in 2018 with oscillations from 0,1-2,5% in certain years), which is not the case with the society in total (46,8% in 2018) (table 1). By representation of women in tourism Croatia is not lagging for global trends, about 54,0% of tourism employees in tourism on global level are women; the greatest representation of women in tourism is being registered in Africa (69,0%), and the lowest in the Middle East (9,0%) (UNWTO, 2019, 9).

---

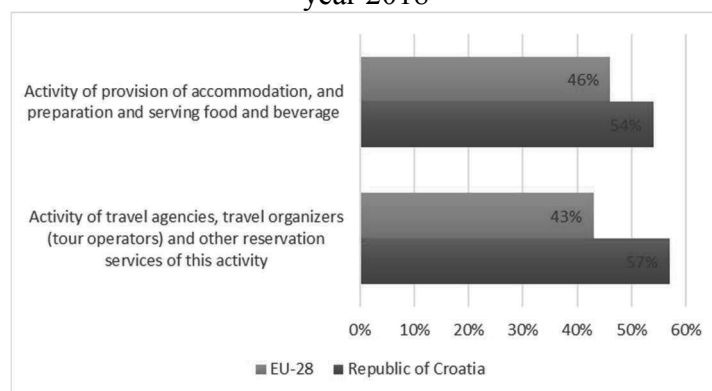
Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2020)

By analysing the movement of the number of women employed in Croatian Tourism (table 1) it is possible to notice their significantly faster growth in relation to the total number of employed women in the period 2010-2018, average annually 3,7% in relation to 0,9%.

Data of the Croatian Bureau of Statistics (2020) and Eurostat (2020) enable us a thorough analysis of share of women in certain tourist activities. Representation of women is higher in the Republic of Croatia in the activity of tourist agencies, travel organizers (tour operators) and other reservation services and activities, 57,1% in 2018 (59,0% in 2015), in relation to the activities of provision of accommodation and preparation and serving food, 53,9% in 2018 (54,3% in 2015), and follows the movements on the EU-28 level (chart 1).

Chart 1: Characteristics of employment in tourist activities, share of employed women in year 2018


Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2020) and Eurostat (2020)

International Labour Organization (ILO) (2017) points on tourism as a strong movement force for inclusive socio-economic development with a significant potential of stimulating formation of entrepreneurship and workplaces especially for women, young people and more frequently migrants with part-time, seasonal and occasional employments. In the structure of employed women in the activities of provision of accommodation and preparation and serving food and beverages in the legal entities dominate women from 25-34 years of age (27,31% in 2018), which together with the employees from 19-24 years of age make a share of 36,05% which is a significantly higher share than on the level of total economy (27,31%).Tourism enables for your

people to enter the labour market. In the year 2018, 4,1% of the employed women in the activities of provision of accommodation, and preparation and serving food and beverages were younger than 18 (1,1% on the level of total economy). Croatian Tourism and Services Union (2018) points on the problem that women older than 50 face during employment, who after losing employment, find it very hard finding new job, regardless of the years of service, expertise and ability. Similar problem are also facing women of younger life age, who due to the expectations of the employer that they will be absent from work for a considerable period of time due to the possible pregnancy or maternity leave are not an attractive segment of labour market to the employers.

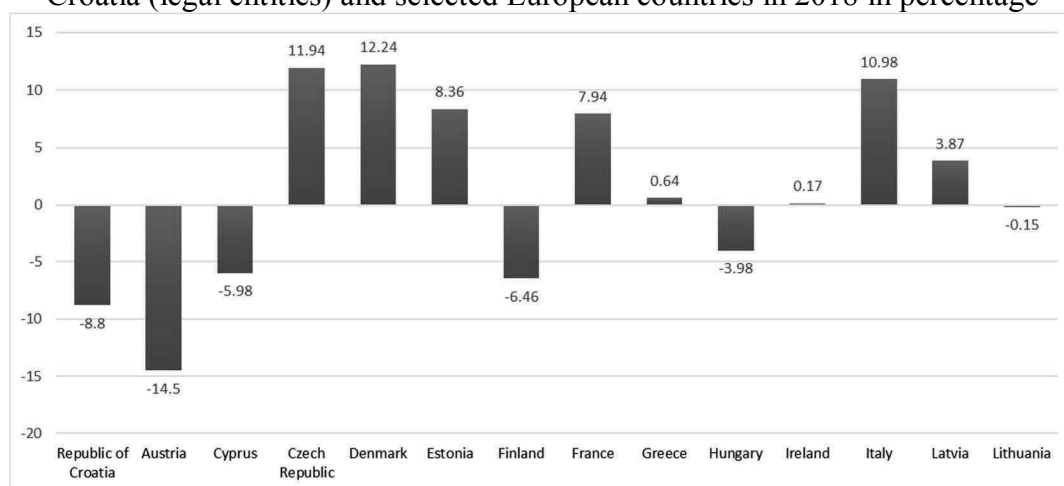
Foreign people make a big part of employees in Croatian tourism. Croatia is faced with a drastic outflow of population and the problem of lack of work force for the needs of tourism. According to the data of Croatian Employment Service (2019), the employers have reported to them 33.199 of free workplaces in 2018 in the activity of provision of accommodation, preparation and serving food (or 13,1% of total free workplaces in the Republic of Croatia), and from the register 31.635 people was employed (or 20% of total number of unemployed people in the register of the Croatian Employment Service). The quota of foreign workers in tourism and catering business in 2018 was 4.400, and in 2019 it was increased to 18.591. The greatest need for the auxiliary workers is in tourism (quota 7.560 of permanent and 7.220 seasonal workers in 2019). Precisely on these jobs mostly women and young people are being employed which are also at the same time poorly paid. By proposing a new Law about foreigners which should come into force during 2020, import of work force into the Republic of Croatia would be liberalized completely, and quotas would be abolished (Government of the Republic of Croatia, 2017; Government of the Republic of Croatia, 2019).

Croatian tourism is characterized by seasonality, and the majority of tourist arrivals and overnights are achieved in the period from June until September (72,0% of tourist arrivals and 84,0% of tourist overnights in 2018). Pearson´s Coefficient of Correlation r = 0,85 points on a positive and strong connection of achieved tourist arrivals and employment of women in tourism of Croatia according to the months of year 2018, respectively, growth of number of tourist arrivals during the year brings to the increase of employed women in tourism. In 2018, Croatian Employment Service (2019) mediated in employing 18.671 workers on seasonal jobs in activities of providing accommodation, preparation and serving food (or 58,7% of total employees on seasonal jobs), and continental parts of Croatia are a significant source of seasonal work force in coastal destinations. Tourism provides opportunities of employment for low-skilled women. However, these are mostly low-paying jobs, such as cleaning maids, chambermaids, laundresses, auxiliary workforce in the kitchen, horticulture, etc., while at the workplaces such as receptionists, cooks or waitresses there are significantly few of them. According to the data from Croatian Employment Service (2019), most of seasonal employees in the Republic of Croatia in 2018 were in the occupations: waiters (2.769 or 8,7 % of total employees on seasonal jobs), cook (2.567 or 8,1 %), assistant chef (1.549 or 4,9 %), cleaning lady (1.473 or 4,6 %), chambermaid (1.381 or 4,2 %) and administrative officer (1.192 or 3,7 %). With the assumption for low-skilled women and on lower paid workplaces, it can be concluded that in 2018 on these workplaces in legal entities there was 6.187 women (20,3% of total number of employed women in relation to 16,4% of total number of employed men (Croatian Employment Service, 2019). In the activities of provision of accommodation, preparation and service of food and beverages, on these workplaces' women participated with 21,7%, and in the activities of travel agencies only with 4,0%.

In the activities of provision of services of accommodation and preparation and serving food and beverages the employers applied a long practice of part-time employment, and contracts of employment were frequently signed year per year. Such practice is being abandoned, and the employers use various available measures with the purpose of keeping the employees for the

next season, i.e. the measure of "Permanent seasonal worker". The employer can use this measure for the number of seasonal workers as how many employees he has employed in his company on indefinite time (Croatian Employment Service, 2019). In year 2010 (on the 31st March), employed women on the indefinite time in the activities of provision of services and preparation and serving food and beverages participated with 81,9%, and their share in the following years had a tendency of reduction, and in 2018 it amounted 64,4%.

UNWTO research (2019) indicates that the gap of salaries in tourism among genders is smaller than in the wider economy on global level (-14,7 % in relation to -16,8 %). However, in Croatia it is greater in relation to the total economy (measured by the share of gross salaries of women in the gross salaries of men in the activities of provision of accommodation and preparation and serving food and beverages) (-8,8 % in relation to -7,1 % u 2017), and it is especially expressed in the activity of accommodation which shows a difference of -10,6 %. Salary gap among genders in the activity of travel agencies is significantly smaller, and it is also smaller in the relation to the salary gap among genders in total economy (-3,2 %). In relation to the EU-28 member countries, Republic of Croatia is showing a greater salary gap in tourism in relation to the total economy together with Austria, Cyprus, Finland, Hungary and Lithuania, while it is smaller in countries like Czech Republic, Denmark, Estonia, France, Ireland, Italy and Latvia (chart 2).

Chart 2: Difference of share of women´s salaries in the salaries of men in the Republic of Croatia (legal entities) and selected European countries in 2018 in percentage


* For Croatia data from 2017

Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2019a) and UNWTO (2019).

By comparing the salary gap among genders in activities of provision of accommodation, preparation and serving food in Croatian counties, the greatest gap can be noticed in the county of Međimurje (-22,1 %), followed by the county of Dubrovnik-Neretva (18,9%), and county of Šibenik-Knin (18,2%), while on the other hand, in the county of Bjelovar-Bilogora, women´s gross salaries are greater than men´s gross salaries for 3,4%. By comparing the differences in the salaries of women and men, and the share of women in the total number of employees in the activities of provision of accommodation and preparation and serving food and beverages according to the counties, a positive, but slight correlation can be noticed (r=0,07), which means that a greater share of women in the total number of employees brings to the greater gap in gross salaries among genders. However, by grouping counties into two groups Continental and Coastal Croatia, it can be determined that in the activities of provision of accommodation, and preparation and serving food and beverages participates approximately 58,77% of women, and the salary gap is -12,71%, while in Coastal Croatia women participate with 54,46% and the

salary gap is -16,44%. By calculating the Pearson correlation coefficient, a complete correlation (r=1) between the mentioned variables was determined. However, although in the case vice versa we come to the same conclusion (complete correlation, r=1), this is incorrect because there are counties in which a large share of women is in the total number of employees, and women´s salaries are not smaller in relation to men.

Croatian Tourism and Services Union (2018) points to the problems of labour of women in tourism. Among them is working in shifts, too big scope of work due to the lack of work standards, and which women, due to the fear of cancelling their contract, accept by working without free days, and avoid sick leave in situations when they are seriously ill, etc. However, the lack of work force, especially qualified one, had also positive effects in the sense of increased care of the employers for improving work conditions. Employers are trying to keep the employees by using various motivators with a goal of increasing their satisfaction in workplaces.

2.2. Women employers in Croatian tourism

UNWTO researches (2019) show how tourism sector provides significantly greater opportunities of entering women into the world of entrepreneurship, in relation to the wider economy. It provides for women the possibility of self-employment and entrepreneurial activities, so in many developed countries participation rates are gradually coming closer to those of men, assisted by the public policies of support to the female entrepreneurship. Opposite to that, in many developing economies gender differences are present, especially in the Arabic countries, countries of North Africa and East Asia, frequently as a consequence of restrictive gender and cultural norms, in which possibilities of female entrepreneurship are reduced to a minimum or they do not exist at all (UNWTO, 2019).

Multidisciplinarity of tourism provides the opportunity for women entrepreneurs to exploit their potential in various business activities, as owners of accommodation facilities, catering facilities, tourist agencies, enterprises for organization of events in destinations, counselling for small renters, promotion of tourist destination through web portal, selling accommodation through the internet, producing souvenirs, agricultural products for tourism needs, gastronomic offer, tourist online magazine, etc. Through an innovative approach to entrepreneurship, women entrepreneurs contribute towards diversification of a tourist product and improving its quality, and open new possibilities for competitiveness of Croatian tourism on the global tourist market. Data from the UNWTO (2019) show that a share of self-employed women in tourism of a greater number of European countries is bigger in relation to the wider economy, i.e. in Austria in 2018 there were 38,3% of self-employed women in tourism in relation to 37,7% in the wider economy, in Spain 36,3% in relation to 34,2%, Great Britain 32,4% in relation to 32,2%. Republic of Croatia also shows a greater share of women trade owners in the activity of provision of accommodation and preparation and serving food and beverages (35,1% in 2018), in relation to the total economy (33,1%), but its decrease can be noticed in the period 2010-2018 (table 2).

According to the data from FINA (2019), trading enterprises in the activity of provision of accommodation, and preparation and serving food and beverages participate in total ownership women participate with a slightly greater share in relation to the total economy (24,8 % in year 2018 in relation to 22,0 %). If to this set is added a set of mixed founders in which women participate as well (9,1%), then their share is increased to 33,9% and approaches to the share of women in trade.

Table 2: Difference of share of women considering the ownership of the crafts and trades and trading enterprises in the activity of provision of accommodation and preparation and serving food and beverages and total economy in the Republic of Croatia in the period 2010-2018 (in %)

Year	Crafts and trades			Trading enterprises		
	Share of women in total in %	Share of women in the activity of provision of accommodation and preparation and serving food and beverages	Difference	Women founders of the trading company-total	Activity of provision of accommodation and preparation and serving food and beverages	Difference
2010	23,1	29,3	6,2	17,3	-	-
2011	29,5	33,6	4,1	18,0	-	-
2012	29,7	33,2	3,5	18,5	-	-
2013	29,9	33,3	3,4	19,6	-	-
2014	30,6	33,9	3,3	20,4	-	-
2015	31,4	34,2	2,8	18,3	-	-
2016	32,0	34,2	2,2	21,8	-	-
2017	32,5	34,4	1,9	21,9	24,4	2,5
2018	33,1	35,1	2,0	22,0	24,8	2,8

Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2020) and FINA (2019).

Trading enterprises in the activities of provision of accommodation and preparation of food and beverages in the ownership of men participate with a significantly greater share in relation to women, 57,9% in 2018 (reduction for 1,1% in relation to 2017), and have a triple higher number of employees (26.738 in relation to 8.861 of employed in trading enterprises owned by women). They employ on average more employees than those in the ownership by women (4,1 in relation to 3,17), and are achieving higher income per employee (for 26,3% in 2018). This points to the greater activity of trading enterprises in the ownership by men in relation to the trading enterprises owned by women. Still, the significance of enterprises in the ownership by women is greater and greater, and its number in 2018 is increased for 18,2% in relation to 2017. Trading enterprises owned by women achieve greater growth of income per employee in relation to trading enterprises owned by men (8,3 % in 2018 in relation to 2017, respectively 3,1 %).

Number of trades and trading enterprises in total or partial ownership by women in activities of provision of accommodation and preparation and serving food and beverages, as well as the number of employees in them and achieved income are the indicators of influence and significance that women have in Croatian tourism. Growth of their number is a clear indicator that women are entering more and more into the business world precisely through tourism activities.

3. Women managers in Croatian Tourism

Considering the representation of women in Croatian tourism, it is completely understandable that they are represented and influential in the segment of making managerial decisions. Based on the data about the number of trades and trading enterprises in the ownership of women it is visible that about 30% of them in the activity of provision of accommodation and preparation and serving food and beverages possess and manage their own trade and trading enterprises, so it can be stated that in that percentage they are also managers.

Authors´ research that was conducted in 150 leading enterprises in the Republic of Croatia according to the achieved incomes in 2018 (45 joint stock enterprises and 105 limited liability

enterprises) has shown the position of women on top managerial positions, in supervising committees, and management of trading enterprises. In 2018 observed trading enterprises have employed 26.283 employees or 37,9% of total number of employees in trading enterprises in the activities of provision of accommodation and preparation and serving food and beverages, and the first 20 trading enterprises according to the achieved income have participated in total incomes of trading enterprises in the activities of provision of accommodation and preparation and serving food and beverages with 25,0%. A supervising committee and management of the company was established in 63 trading enterprises (42%), and in 87 trading enterprises (58%) it was not established. In trading enterprises with the supervising committee there was 20.700 employees (78,8 %) (table 3).

Table 3: Women in the supervising committees and management of trading enterprises in 2018

	Trading enterprises		Employees		Members of the supervising committee			Board members		
	Number	Share (%)	Number	Share (%)	Total	Women	Share of women (%)	Total	Women	Share of women (%)
Supervising committee	63	42,0	20.700	78,8	262	58	22,1	109	15	13,8
Without the supervising committee	87	58,0	5.583	21,2	-	-	-	134	42	31,3
Total	150	100,0	26.283	100,0	262	58	21,3	243	57	23,5

Source: Authors´ adaptation according to the Croatian Chamber of Commerce (2020)

Observed trading enterprises had 262 members of the supervising committee and 243 management members. From the total number of members of the supervising committee 204 are men (77,9%) and 58 women (22,1%). In the management of trading enterprises in 2018 there was 186 men (76,5%) and 57 women (23,5%). Trading enterprises with the supervising committee had 109 persons in the company´s management, of which 94 men (86,2%) and 25 women (13,8%). Slightly smaller difference is noticeable in the trading enterprises in which there is no supervising committee; of total number of management members 134 were men (68,7%), and women with 31,3%.

Furthermore, the analysis covered participation of women in the supervising committee and management of trading enterprises in relation to the size of the trading company (micro, small, medium and large) (table 4). The greatest share of women in the supervising committees of the observed trading enterprises had small trading enterprises (30,0%), and the smallest share large trading enterprises (15,0%). Share of women in the management of these trading enterprises was 0,0% in large trading enterprises up to 50,0% in micro trading enterprises. In trading enterprises in which supervising committee was not established, women participate in the greatest share in the management committees of small trading enterprises (40,8%), and in the smallest in micro trading enterprises (0,3%).

Table 4: Women in the supervising committees and management according to the size of trading enterprises in 2018

	Trading enterprises		Employees		Members of the supervising committee			Board members		
	Number	Share (%)	Number	Share (%)	Total	Women	Share of women (%)	Total	Women	Share of women (%)
Trading enterprises with the supervising committee										
Micro	2	3,2	7	0,0	6	1	16,7	2	1	50,0
Small	5	7,9	157	0,8	20	6	30,0	6	0	0,0
Medium	34	54,0	4.110	19,9	136	36	26,5	60	9	15,0
Large	22	34,9	16.426	79,3	100	15	15,0	41	5	12,2
Total	63	100,0	20.700	100,00	262	58	22,1	109	15	13,8
Trading enterprises without the supervising committee										
Micro	6	6,8	13	0,3				8	1	0,3

Large	4	4,6	819	14,7	-	-	-	7	2	28,6
Total	87	100,0	5.583	100,0				134	42	31,3

Source: Authors´ adaptation according to the Croatian Chamber of Commerce, 2020.

Average number of the members of the supervising committees in the observed trading enterprises is 4,2, while the average number of women in the supervising committee is 0,9. Average number of members of the management in trading enterprises is 1,62, and the average number of women in management 0,38 (in trading enterprises with the supervising committee 0,24, and in the trading enterprises without the supervising committee 0,48) (table 5).

Table 5: Average values of members of the management and supervising committees in the observed trading enterprises in Croatia in 2018

	Management members	Women	Members of the supervising committee	Women
Average	1,62	0,38	4,2	0,9
Median	1	1	4	1
Mod	1	0	3	1
Maximum value	6	3	7	3
Minimal value	1	0	1	0
Variations	5	3	6	3
Total number of members	243	57	262	58
Total of observed trading enterprises	150	150	63	63

Source: Authors´ adaptation according to the Croatian Chamber of Commerce, 2020

The median number of members of Board is 1, as well as that of women, while that of the members of the Supervisory Board is 4,2 and that of the women in the Supervisory Board is 1. The Mod indicates on the most frequent number of members of the Supervising Committee, 3, while that of women in the supervising committee is 1. The most frequent number of members of the board is 1, while the most frequent number of women as members of the board is 0, which means that in the observed trading enterprises most frequently there is no women in the management, as it is the most frequent situation that in the supervising committees appears only one woman.

The data indicate a very low level of participation of women on top managerial positions (unless they are not entrepreneurs at the same time). However, in practice it is possible to stumble upon

positive trends in improving the position of women on managerial levels. I.e., Valamar Riviera d.d. which in 2018 employed 5.770 employees[2] (9,2% of total number of employees in the provision of accommodation and preparation and serving food and beverages) increased the share of women managers from 39,0% (167) in 2016 to 41,6% in 2018. In the operating sector women managers participate with 45,0%, while in the corporate services they participate with 36,0% (Valamar Riviera, 2019, 80). However, it can be stated that the situation in terms of relations among genders in managerial functions in tourism is changing, which is indicated by a significant progression of women in acquiring responsible positions within the hotel enterprises.

3.1. Formal and informal education of women in tourism

Education and qualifying in tourism promote gender equality and strengthening of women in the tourism sector (UNWTO, 2019, 8). Women make the majority of students in the formal education, as in the world, and in the Republic of Croatia. From the total number of students who finished high school of catering and tourism in the school year 2017/2018 there was 1.216 of women (67,4%). In the Crafts high schools' women make a smaller share than men, and in the school year 2017/2018 there was 887 of them (43,2%). Women have, in a greater ratio (53,1%), finished a professional school of catering intended for the adults. In 2018, higher education institutions were finished mostly by female students (60,6%) (Croatian Bureau of Statistics, 2019b). Share of women who in the period 2014-2018 finished a university study of Faculty of Tourism and Hospitality Management moved from 72,5% and 79,1% (table 6).

Table 6: Share of women who finished university study of the Faculty of Tourism and Hospitality in the period 2014-2018 in %

	Share of women in %
2014	73,9
2015	74,6
2016	72,5
2017	75,2
2018	79,1

Source: Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2020c)

Greater education of women is visible as well by analysing the number of employees in legal entities in Croatian tourism in 2018, in which the activity of travelling agencies, travel organizers (tour operators) and other reservation services of these activities shows a greater share of women in high, higher and secondary education in relation to the activity of provision of accommodation and preparation and serving food and beverages in year 2018 (table 6).

Table 7: Share of employed women in total number of employees in legal entities according to the level of professional education in %

	Activity of provision of accommodation and preparation and serving food and beverages	Travel agencies, travel organizers (tour operators) and other reservation services and activities related with them
High – total	61,6	68,7
Doctors	65,6	100,0
Masters	66,1	42,9
Higher	55,2	62,7

	Activity of provision of accommodation and preparation and serving food and beverages	Travel agencies, travel organizers (tour operators) and other reservation services and activities related with them
Secondary	52,0	49,1
Lower	73,0	62,5
High qualified	30,8	42,9
Qualified	49,2	25,6
Half-qualified	68,9	17,6
Non-qualified	70,2	62,5

Source: Authors´ adaptation according to the Croatian Bureau of Statistics (2019a)

Growth of demand for employees in tourism and the need for ensuring quality, creative, innovative and flexible employees has resulted in establishing regional centres of competitiveness in Zabok, Split, Osijek, Opatija, Pula and Dubrovnik, as centres of professional education in the sector of tourism and catering. This seeks strengthening the interest for professions in the tourism and catering and ensure more internships for students in order to make their entry into the labour market easier. Project is financed with the European Union funds. Besides that, centres should also ensure additional professional knowledge and necessary skills for the adults.

Awareness about the importance of informal education is more and more present with the Croatian employers, and employees, among which are women as well, participate in diverse education programs and educations, one-day and multiple-day courses and seminars, fairs, conferences, exhibitions, congresses, etc. In the lack of quality education programs which would train personnel in tourism for the needs of labour market, internal education programs become the key through which employers tend to achieve competitiveness (i.e. Valamar Academy). Developing personal competences through an educational program creates satisfied employees who are loyal to the employer, and at the same time creates the image of an attractive company for recruiting new employees.

3.2. Influence of women on Tourist Policy

According to the data from the UNWTO (2019), 23 ministers of tourism in the countries covered by the research in 2018 were women, and in relation to the year 2010 their share is increased for 2%. That share is slightly bigger from the share of total number of women in the ministry´s positions (20,7%). In Croatia the representation of women in the Parliament is on the level of 20,5%, and in the government four women are ministers (19,0%).

Republic of Croatia has 313 tourist boards and 19 agencies in which the representation of women is 52,6% (10 directors/heads of agencies) and Croatian National Tourist Board (Croatian National Tourist Board, 2020). Women are not represented on the highest functions like Minister of Tourism or Director of the Croatian National Tourist Board. However, women are taking significant positions by which it is influenced on the policy of tourism (i.e. assistants of the Minister of Tourism, adviser of the Minister of Tourism, etc.). By focusing on Destination Management, women employed in tourist boards on various levels stimulate innovative tourist offer in their destinations (the example of city of Zagreb), they act towards greater recognizability of Croatia on foreign markets (example of the representation of the Croatian Tourist Board in New York (Croatian National Tourist Office, Inc. – New York) whose

activities resulted in increasing tourist arrivals for 119% from Canada and the USA and tourist overnights for 76,7% from Canada and 124,3% from the USA in the period 2014-2018.[3]

Trade union organizations are dominated by men, both at the head of trade union branches and in union entities, despite an equal number of women and men joined in the union. The Presidency of the Croatian Trade Union for Tourism and Services is entirely made up of men, but within the trade union there is a Section of Women that works with the purpose of improving the position of women in Croatian tourism.

Entering the European Union opens various possibilities of financial support of development of female entrepreneurship, HBOR loan programs for entrepreneurship of women, etc. Besides that, significant efforts are being made for economic strengthening of women through employment through tourism (revival and running the dead resources of rural tourism, gastro offer, crafting souvenirs, etc.). Future of Croatian tourism will most definitely depend on gender equality. Women need to be encouraged towards accepting managerial positions. This is possible only through firm instalment of gender equality on Tourism Policy.

4. Conclusion

In Croatian tourism women are taking a significant role which primarily arises from their greater representation in employment. This can be clarified by the character of jobs in tourism which are being considered more "female" as a phenomenon based on the hospitality and traditional gender roles which must have had key role in the very beginning of tourism development. However, throughout the time women have fought also for the work on the positions that are not typically "female", especially through female entrepreneurship. In corporation systems women are taking more and more significant positions on managerial functions, and through diverse education programs they are stimulated for taking over the managerial positions. It can be concluded that gender inequality in Croatian tourism is on lower level in relation to the wider economy, and it is confirmed how women through activities connected with tourism have more opportunity for progress. However, gender inequality is still present, at the expense of women, which is clearly visible through their lower representation on managerial positions in relation to men as well as key positions of creating tourism policy. Furthermore, women, although more educated, have lower salaries from their male colleagues on the same workplaces. By following the research results it is clear that women in tourism are making a resource, by whose retention on low-qualified positions diverse talents and capabilities remain unexploited. This is certainly not the goal that the Republic of Croatia is aiming for, so it is necessary, through tourism policy, to encourage women to participate more in entrepreneurship and management.

THE IMPACT OF CHINA ON EUROPEAN UNION INDUSTRY

ABSTRACT

The industry is at the core of the European Union growth and development. According to Eurostat, it provides more than 52 million direct and indirect jobs, it represents more than 50% of European exports, and it accounts for approximately 65% of investments in research and development. However, in the future, the EU industry will have to face "megatrends" linked to globalization, climate change, energy transition, fourth industrial revolution and socioeconomic changes. Certainly, there are the threats and opportunities associated to these challenges and the impacts of the above-mentioned megatrends will differ depending on the industrial sector, but also on territorial characteristics. On the other hand, China is rapidly becoming a great industrial competitor and a powerhouse in high-tech and growth sectors. Through the extensive Made in China 2025 strategy, China aims to become a world leader in 10 key industrial sectors. Hence, this paper (i) explores the European Union industry's position vis-à-vis China's, (ii) analyses and compares which sectors are dominated by the EU and which sectors are not. The results point to the fact that the EU needs to strengthen its industrial base through intensive coordination to maintain its position.

Key words: *industry, industrial policy, European Union, China.*

1. Introduction

Industry is of crucial importance for the overall functioning of the European Union (EU) economy due to its multiplier effects on other sectors, its effect on future progress, prosperity and wealth creation, and its significant contribution to economic growth, employment and innovation. Hence, industrial policy is back on the agenda around the globe (Aiginger and Rodrik, 2020; Landesmann and Stöllinger, 2020) and accordingly in the European Union (Pianta and Zanfei, 2016; Savona, 2018), especially after the global financial crisis in 2008. In that sense, the European Commission (EC) published a series of communications, strategies and action plans in recent years explicitly addressing the issue of an "EU industrial policy" (European Parliament, 2019), which in the EU "has traditionally been a mixed approach, incorporating both horizontal and sector-specific measures, with significant variation in focus

over the decades" (Landesmann and Stöllinger, 2020). However, industrial policy can no longer be an isolated policy, developed on its own (Aiginger and Rodrik, 2020).

Besides, global competition is increasingly fierce, and Europe's competitors do not shy away from adopting more aggressive industrial strategies or protectionism, subsidising and shielding their own national industries (Bjerkem et al., 2019). In that context, Europe's open and competitive Single Market represents the biggest added value for the progress of industry. However, while Europe has opened much of its market to the rest of the world, European industry rarely enjoys equal market access to third countries (Bjerkem et al., 2019). Some countries, such as China, are even increasingly closing off further market segments to bolster their own companies and become 'self-sufficient' (Bjerkem et al., 2019), thus posing a major challenge to the economy of the European Union. More precisely, the rise of China, with its geopolitically motivated One Belt, One Road initiative and its comprehensive and ambitious industrial policy strategy entitled 'Made in China 2025', is a major trigger for the new European industrial policy (Landesmann and Stöllinger, 2020).

The severity of state of the industry was confirmed by President-elect of the Commission, Ursula von der Leyen. To help drive the change Europe need, she announced her plan for a future-ready economy through new industrial strategy (von der Leyen, 2019). The promise made has resulted in a new industrial strategy adopted in March 2020 (*A New Industrial Strategy for Europe*). Namely, EU is in the middle of two great transitions – to an economy that's both digital and green and "will face challenges ("megatrends") from multiple sources: technological changes, socio-political changes (including globalisation and geopolitics) and climate change" (European Parliament, 2019). Simultaneously, all these factors will represent threats and/or opportunities, depending on how much Member States are prepared for the upcoming changes. It is hard to predict where these megatrends will lead.

China is certainly a challenge but also "offers significant opportunities to European businesses and vice versa" (BusinessEurope, 2020). Aiginger and Rodrik (2020) claim that China is both a threat and an example to emulate. Nevertheless, the EU and China are linked by an enduring relationship because they are two of the three largest economies and traders in the world (European Commission, 2019a). China is also the EU's second biggest trading partner behind the United States and the EU is China's biggest trading partner (European Commission, 2019a). Therefore, the adoption of a new European industrial model to respond to a series of specific and interconnected challenges facing EU industry is required. Aiginger and Rodrik (2020) state that "the industrial policy of the future is unlikely to look like the economist's traditional conception of it: top-down policymaking, targeting pre-selected sectors, and employing a standard list of subsidies and incentives" and this must be kept in mind when adopting new policies.

It is evident that there is a need to analyse the impact of China on the European Union's economy in the context of taking over leadership on the world industrial scene. The paper consists of five chapters. After the introduction, the second chapter covers the framework that defines the relations between the European Union and China, and then, in the third chapter, discusses the strategic documents implemented by these two to guide global industrial policy. Chapter 4 covers the empirical analysis of the EU and China industries. Chapter five concludes.

2. European Union – China: Cooperation framework

The relation of Europe and Asia is a history long. Up to 2020, almost half EU imported goods and services come from Asian countries. Over one third of exports from the EU go to Asian markets. This economic exchange is not the only relationship between Europe and Asia although we will consider only that part of the story here. Asian country of interest is China as it is the most important EU trade partner. China is especially important as a hub of global supply chains. The EU and China, as the world's second and third largest economies with each being the other's largest source of imports and second largest export destination (García-Herrero et al., 2017, 1), consider their bilateral economic cooperation as particularly important. The EU is China's biggest trading partner while China is the EU's second largest trading partner behind the United States. Trade in goods between the EU and China is worth well over €1.7 billion a day (EUEA, 2019). That China is prominent topic can be seen in EU's external relations agenda. All said, along with US protectionist policies as well as serious economic challenges which resulted from the 2008 global crisis and Coronavirus epidemy, contribute to more bilateral polemic. As non-competitors in terms of global security and despite some fundamental divergences (e.g. related to state intervention and fundamental human rights) their economic relationship concerns areas ranging from trade and investment to human rights and cyber security. It is expected that deepening of this relationship should bring mutual benefits in terms of driving economic growth, creating jobs, and improving levels of social welfare (García-Herrero et al., 2017, 1).

EU-China diplomatic relations were formally established in 1975 and three years later, in 1978 the (then called) European Communities signed an economic agreement with China. Given the above-mentioned importance of their economic relations, the goal is to maintain very close trade and investment links, while developing a more balanced economic relationship (EUEA, 2019).

Eckhardt (2019) identifies three phases in EU-China trade relations. The first phase – from 1978 until the Tianmen Square massacre in 1989 – was dominated by EU protectionism against Chinese imports and a relatively powerless China. During the second phase – from 1989 until 2002 – trade relations where increasingly driven by China's economic pull, while the EU continued with its protectionist measures against China. The third phase – from 2002 – can be characterized by increased politicization between the EU and China.

During the third phase in EU-China trade relations, in 2003, the first comprehensive strategic partnership between EU and China formed. A top-level joint document "The EU-China 2020 Strategic Agenda for Cooperation", adopted in 2013, guides that strategic partnership (Saarela, 2018). Key messages in this document are the EU's respect for China's sovereignty and territorial integrity and China's support to EU integration. As China continued its economic growth along with its importance in EU's external trade, EU adopted the Joint Communication on elements for a new EU strategy on China on 22 June 2016 as its strategy on China (EC, 2016). The requirements EU imposes on China are supportive of rules-based international order and connectivity through transparency, reciprocity, non-discriminatory market practices, level playing field for economic operators, fair competition across all areas of cooperation, and protection for intellectual property rights. In particular, a greater opening-up of the Chinese market to European business and investment is a must (Saarela, 2018). In 2018, the initiative Elements for an EU Strategy on Connecting Europe and Asia was introduced but for information purposes only.

To date, the negotiations on a comprehensive EU-China Investment Agreement (CAI) launched in 2013 with a goal of deepening and rebalancing relations with China are still in process. The EU-China CAI has been conceived as a stand-alone investment agreement, but its scope went beyond the usual investment protection dimension to equalize level of openness in China's market with the EU's market. In that sense, the EU's top priorities are a CAI which would provide proper reciprocity in terms of market access for Chinese and EU investors, ensure a level playing field by liberalising China's economy and reducing the role of state-owned enterprises and a reliable and more transparent regulatory environment for investors and investments (Saarela, 2018). So far, 27 rounds of the EU-China investment agreement negotiations have taken place, the most recent one in March 2020. Goals set by EU-China CAI (new market opportunities) apply to the whole economy and all EU-China relations.

The Chinese and European economies have benefitted tremendously from China's accession to the WTO in 2001 (BussinessEurope, 2020). It implied that China would reform and liberalise its economy. While there has been a significant progress, key problems still remaining are (*i*) a lack of transparency, (*ii*) industrial policies and non-tariff measures that discriminate against foreign companies, (*iii*) strong government intervention in the economy through state-owned enterprises and, and (*iv*) poor protection and enforcement of intellectual property rights (EC, 2020b).

Namely, many EU business leaders have come to perceive Chinese companies as sources of unfair competition while China's state-owned enterprises (SOE) creates concerns for the EU about market access. As for China, its government believes that the EU discriminates against China's SOEs claiming that they are becoming increasingly corporate in their structure and market oriented through reforms (García-Herrero et al., 2017).

The scale of China's Belt and Road initiative (BRI) projects (which started in 2013 to boost economic integration and connectivity) has raised concerns in some countries regarding sustainability and the ability of fiscally vulnerable nations to service and repay the substantial amounts borrowed from Chinese financial institutions (Ghossein et al., 2019). One of the most recent tensions between EU and China are regarding the cooperation between China and Central and Eastern European Countries (Chine-CEEC, also 17+1, formerly 16+1). It is stated that cooperation's main goal is promotion of business and investment relations between China and 17 CEEC countries (Albania, BiH, Bulgaria, Croatia, Czech Republic, Estonia, Greece, Hungary, Latvia, Lithuania, North Macedonia, Montenegro, Poland, Romania, Serbia, Slovakia and Slovenia). It can be seen in action on the example of many infrastructure projects carried out by Chinese companies and financed by Chinese loans e.g. building of Croatian Peljesac Bridge and its access roads (see more on http://www.china-ceec.org/eng/). The EU raised concerns regarding this cooperation describing it as aggressive Chinese investment initiatives (CRS, 2019) and claiming that China is implementing the 'divide and conquer' strategy where the EU unity and competition rules (e.g. the EU transparency requirements in public tenders) are to be shaken. Even the European Commission for the first-time labelled China as a "systemic rival" of the EU (EC, 2019a).

Finally, there is growing awareness among the European business community that there are systemic problems between EU and China. The EU switches the ball to China saying that their bilateral relationship depends on whether China can successfully address the growing challenges which European companies face when doing business on the Chinese market or when competing with Chinese companies on the European market and on third markets

(BussinessEurope, 2020, 5). What is clear is that recent development in bilateral economic and trade relations makes EU and China closely interdependent.

3. China vs. European Union's strategy to achieve industrial modernisation

As for the EU-China relationship in the context of struggle for industrial leadership, the requirement for a stronger domestic industrial policy is the key. The EU industry is currently going through major challenges, from a slowdown in global trade, a rise in tariffs and protectionism, an emergence of new technologies and development of global value chains to need for industry to become more sustainable, competitive and climate-neutral. These constitute some of the main drivers for industrial transformations and must be addressed effectively by an EU industrial strategy in order to compete China adequately. The EU and its member states, both individually and as a unit, have been seeking for strategies to meet these challenges (Bjerkem et al., 2019). On the contrary, China's economic power and political influence have grown with unprecedented scale and speed in the last decade, reflecting its ambitions to become a global leader (EC, 2019a).

While the EU focuses on creating unique strategies for more competitive Europe as a unit, the member state's strategies focus on their own, domestic industry. As Bjerkem et al. (2019) write, this is not surprisingly due to a lack of a strong and efficient industrial strategy at the EU level. Even Germany, on the eve of the European Commission's rejection of the Siemens-Alstom merger (on February 2019), presented a new industrial plan for Germany, "Industrial Strategy 2030 – Strategic Guidelines for German and European Industrial Policy". They justify the strategy as necessary for the German state to fulfil its promise to maintain "well-being for all". Germany's industrial strategy for 2030 includes suggestions on how to reform EU competition policies as to allow 'European champions' to 'take on' competition from China and the US. It was quickly followed by a "Franco-German Manifesto for a European industrial policy fit for the 21st Century" which highlighted that Europe's economic strength will be hugely dependent on Europe's ability to remain a global manufacturing and industrial power (BMWi, 2019). At the same time, French Economy Minister declared that blocking the merger was a "political mistake" which "will serve China's economic and industrial interests". Meanwhile, his German counterpart stressed that the decision (European Commission's rejection of the Siemens-Alstom merger) "demonstrates the urgent need for a European Industrial Strategy" and the need for "strong European champions" (Bjerkem et al., 2019). Though European industrial strategy already existed earlier, and was updated by Commission on September 2017, many EU Member states considered it too limited (NOVE, Germany's industrial strategy 2030).

As many of the biggest challenges European industry faces are global, the best path for the EU and its member states is to coordinate their efforts, support the renewed industrial strategy and address the challenges together. Protecting one's own national industry and aggregation of national measures can lead to further fragmentation of the Single Market and related EU policies that are fundamental to the competitiveness of European industry. A common EU approach would allow member states to respond to initiatives being developed by the EU's main competitors e.g. Made in China 2025, Belt and Road Initiative, America First (Bjerkem et. al, 2019).

As mentioned earlier, the EU and China are linked over 40 years enduring relationship in which China has evolved from a trivial player to the world's second largest economy, from a primitive pre-industrial technology level to a technological leader. Distorted systemic differences of China's economic policy-making that were tolerable in the past are now a profound challenge

for the EU economy. The "China challenge" is just one issue in an emerging debate about the need for a revision of Europe's competition and industrial policies (Huotari et. al 2019). China's growing economic presence and power can be seen in its presence in global economic policies and projects, especially in infrastructure development, as noted earlier (CRS, 2019). China's Belt and Road initiative (BRI), also called "One Belt, One Road" (OBOR), was launched in 2013 to boost economic integration and connectivity through major infrastructure throughout Asia, Europe, Africa, and beyond, complemented by projects to enhance productive capacity in participating countries, including economic and trade cooperation zones, trade promotion programs and trade and transport agreements (Ghossein et al., 2019). As China's President describe it "The Belt and Road Initiative calls for joint contribution (…) this initiative is from China, but it belongs to the world. It is rooted in history, but it is oriented toward the future. It focuses on the Asian, European, and African continents, but it is open to all partners" (CRS, 2019).

Prior to the initiation of economic reforms and trade liberalization nearly 40 years ago, China maintained policies that kept the economy very poor, stagnant, centrally controlled, vastly inefficient, and relatively isolated from the global economy (CRS, 2019). Since opening up to foreign trade and investment and implementing free-market reforms in 1979, China has been among the world's fastest-growing economies (CRS, 2019). In particular, China is rapidly becoming a major industrial competitor in high-tech and growth sectors (Preziosi et al., 2019). It aims, through the Made in China (MIC) 2025 strategy, to become a world leader in 10 key industrial sectors: next-generation it, high-end numerical control machinery and robotics, aerospace and aviation equipment, maritime engineering equipment and high-tech maritime vessel manufacturing, advanced rail equipment, energy-saving vehicles and new energy vehicles, electrical equipment, agricultural machinery and equipment, new materials, and biopharmaceutical and high-performance medical devices (Preziosi et al., 2019). The MIC 2025 strategy aims to encourage substantial investments from national and regional governments to support domestic firms and improve knowledge infrastructures (Preziosi et al., 2019). The government intends to strengthen China's innovation capabilities and overall competitiveness by, in its own words, 'relying on market forces', though, in line with its 'socialist market economy', the state will remain central (Preziosi et al., 2019).

Made in China (MIC) 2025 is a comprehensive 10-year strategy that has the aim of transforming China into a global powerhouse in high-tech industries (Preziosi et al., 2019). It focuses on intelligent manufacturing in 10 strategic sectors and it was published by the State Council in May 2015. The target year 2025 refers only to the first phase of the strategy, in which the foundations are to be laid (Preziosi et al., 2019). This involves upgrading parts of the economy and developing a (reasonable) number of world-class enterprises able to compete with companies from industrialised/Western countries (Frietsch, forthcoming). There are two further phases, which last up to 2049, when the People's Republic of China will celebrate its centenary (Preziosi et al., 2019). Hence, in the last decade, China's economic power and political influence have grown with unprecedented scale and speed, reflecting its ambitions to become a leading global power (EC, 2019). Namely, China can no longer be regarded as a developing country because it is a key global actor and leading technological power (EC, 2019a).

Finally, the European Council in March 2019 called on the European Commission to present a "long-term vision for the EU's industrial future", addressing the challenges faced by industry. In order to redesign economy and update industrial policy, European Commission (2019c) on December 2019 adopted *The European Green Deal* (COM(2019) 640 final). The European Green Deal provides an initial roadmap of the key policies and measures for making the EU's

economy sustainable with goal to become climate-neutral by 2050. The goal of attaining a climate-neutral Europe by 2050, as proposed by the European Commission, will not be met unless industry is involved (Bjerkem et al., 2019). To deliver the European Green Deal requires the full mobilisation of industry.

In March 2020, at a time of moving geopolitical plates and increasing global competition, European Commission released a *New Industrial Strategy for Europe* which aims to deliver on three key priorities: maintaining European industry's *global competitiveness* and a level playing field, at home and globally, making Europe *climate-neutral by 2050* and shaping *Europe's digital future*. The package of initiatives (*The SME strategy for a sustainable and digital Europe*, *Long-term action plan for better implementation and enforcement of single market rules*, *Identifying and addressing barriers to the Single Market* and many others in process of adoption) outlines a new approach to European industrial policy that is firmly rooted in European values and social market traditions. It sets out a range of actions to support all players of European industry, including big and small companies, innovative start-ups, research centres, service providers, suppliers, and social partners (EC, 2020).

To conclude, it is evident that both economic powers in their own way want to fight for dominance and be on the throne of the world industry.

4. Empirical analysis: EU – China industry

The recent history of European industry is heavily marked by the crisis and the need to secure long-term recovery, which pushed industrial policy for the creation of a wide, umbrella-like policy with a multitude of goals (European Parliament, 2019). The declining contribution of the EU manufacturing to total GDP and the simultaneous fall of its share in global manufacturing have led to concerns about an overall loss of EU competitiveness, in particular vis-à-vis China (Marschinski and Turegano, 2019). On the other hand, China's economic growth has slowed down, but even at these more moderate rates, the country is poised to become soon the largest economy in the world (Aiginger and Rodrik, 2020). Namely, the size of the European economy in 2005 was €11.6 trillion whereas the Chinese economy was worth €1.8 euro trillion, at current market prices; the EU economy was six times larger than that of China (European Commission, 2019b). Today, the Chinese economy is worth €11.4 trillion euro, compared with €15.9 trillion for the EU 28 (European Commission, 2019b).

The European Union is China's biggest trading partner while China is the EU's second largest trading partner. Trade in goods between the EU and China is worth well over a billion a day (on average). The EU, which in the early 2000s was the world's largest economic block in absolute terms, has in the last decade been overtaken by the US (Bjerkem et al., 2019). Additionally, its relative share of the world's GDP has been declining, and the world's economic centre is gradually moving eastwards (Bjerkem et al., 2019). China's share of the global economy in purchasing power parity (PPP) was less than 10% in 2005, but it more than doubled to reach 20%, the largest in the world today (Bjerkem et al., 2019) (Figure 1(b)). In the last 15 years, the Chinese economy grew by more than sixfold (see Figure 1(a) and (b)).

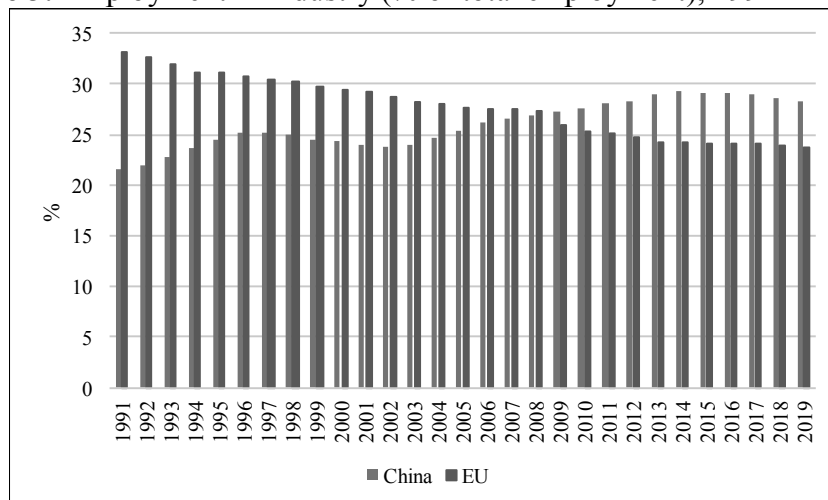
Figure 2 shows the world largest traders. China (EUR 2,111 billion, 16.8 %) was the largest exporter in the world, followed by the EU (EUR 1,958 billion, 15.6%) and the United States (EUR 1,410 billion, 11.2 %). According to Aiginger and Rodrik (2020), the China's "rapid export-oriented industrialization and impressive manufacturing sector have played a critical role in this achievement". Next, China (EUR 1,808 billion, 39.9%) was the third largest importer in the world, preceded by the United States (EUR 2,211 billion, 17%) and the EU (EUR 1,980 billion, 15.2%).

Figure 2: Share of national exports (imports) in world exports (imports) in 2018 (all products, %)
Note: China except Hong Kong, EU28 (2013-2020)
Source: Eurostat

When considering the share of total employment in industry, it is evident that the share of the employment in EU's industry has been decreasing steadily since 1991, while in China is slowly growing. Since 2008, the share of employment in industry is higher in China than in the EU (Figure 3). According to Ait Ali and Dadush (2019) research, "most of the net job creation in manufacturing was in China, while most countries – both developing and developed – saw manufacturing employment decline as a share of total employment and several, including all or nearly all advanced countries, saw an absolute decline".

Figure 3: Employment in industry (% of total employment), 1991 – 2019


Source: International Labour Organization, ILOSTAT database

Figure 4 shows the industry value added (% of GDP and annual % of growth) trend in the period 1991 – 2019. It is clear that China has a much larger share of industry value added during the entire observed period. According to the latest data, in 2018, the share of value added in GDP was twice as high in China compared to the EU.

Figure 4: Industry value added (% of GDP and annual % of growth), 1991-2019
Source: World Development Indicators

The analysis of manufacturing value added (MVA) in the period 1990 to 2016 also shows that industrial output in China took the lead in 2011 and is continuing to grow. On the other hand, the European Union MVA has not yet reached pre-crisis levels and continues to drop (Figure 5).

Figure 5: Manufacturing value added (MVA) in current USD, 1990 – 2016
Source: UNIDO, 2020

The above analysis is also confirmed by the Competitive industrial performance (CIP) data. Namely, according to Competitive industrial performance report 2018, Germany achieved the highest composite score and thus tops the CIP rank – as it has for all but one year since 1990. It is followed by Japan in 2nd place and China in 3rd place (UNIDO, 2019). China's competitiveness has continued to surge, rising from rank 5 in 2014 and 22 in 2000 (UNIDO, 2019). China's climb in the CIP ranks ejected the United States of America from the top 3 to rank 4 and the Republic of Korea down to 5th place (UNIDO, 2019). Thus, successful industrialization processes are not only characterized by the expansion of manufactured exports but also by profound structural change towards technology-intensive industries and this has been the case for China and other successful East Asian countries (UNIDO, 2019). However, "while China should be recognised for making genuine advances in innovation and technology, it is also clear that at least part of its success is owed to generous state subsidies, significant market protection and a lengthy track record of unfair trade practices, commercial espionage

and intellectual property right infringements" (European Commission, 2019b). Its 'Made in China 2025' strategy specifically gives Chinese companies preferential access to capital, both to conduct R&D but also to penetrate markets abroad (European Parliament, 2019a).

Furthermore, the most recent Trade and Investment Barriers Report by the European Commission concludes that European industry currently faces a record number (425) of active trade and investment barriers in 59 third countries (Bjerkman et al., 2019). Interestingly, for the first time, China is topping the list of recorded barriers, followed by Russia, India, Indonesia, and the US. The Commission also estimates that the new barriers recorded in China in 2018 have a significantly larger impact (€25.7 billion) than the restrictions imposed by any other trade partner (Bjerkman et al., 2019). According to McKinsey Global Institute (2019) "China has been reducing its exposure to the world, while the world's exposure to China has risen". This significant increase in trade barriers in China is mostly explained by new restrictions within the ICT sector and on high-tech industries (Bjerkman et al., 2019).

Table 1 shows top five product groups exported by EU28 and China, based on Intracen data for 2018, according to Harmonized System (HS) 2-digit level methodology. As it can be seen, of the top five product categories exported by China and the EU28, there is an overlap in as many as three categories (84 – Machinery, mechanical appliances, nuclear reactors, boilers; 85 – Electrical machinery and equipment and parts thereof; sound recorders and reproducers, television and 87 – Vehicles other than railway or tramway rolling stock). This clearly indicates on which products production are these economies oriented and in which products they want to position themselves. Based on McKinsey Global Institute (2019) analysis implicate that "Chinese technology producer have gained market share in key sub-segments" because China's continued innovation is at the centre of its economic development in an era of spreading digital, automation, and AI technologies. "Because technology value chains are some of the most complex, they require the most collaboration, and China is highly integrated in these value chains, with a large share of global exports and imports" concludes McKinsey Global Institute (2019). Hence, technology is undoubtedly at the heart of the changing relationship between China and the world. On the other side, the EU as a whole has a strong potential to play a bigger scientific role on the global scene, however, the overall level of R&D spending relative to GDP is still relatively low compared to some non-EU countries – Korea, Japan, the United States and China (OECD, 2019).

Table 1: Top 5 product groups exported by EU28 and China, 2018 (Euro thousand)

EUROPEAN UNION			CHINA

5. Conclusion

This paper aims to plot the EU-China relations especially in politics, trade, and industry. The main conclusions drawn are therefore concerning numbers and politics. As for numbers, they show that the two are world largest traders with China being the largest exporter in the world and the EU is following; also, the EU and China are the second and the third largest importers in the world, with US on the top. Above all, the European Union is China's biggest trading partner while China is the EU's second largest trading partner.

More from numbers in industry: the share of total employment in industry has been decreasing in EU while growing in China. This is reflected also in the industry value added where trend is clear – China has a much larger share of industry value added during the entire observed period (1991-2019). On top, the analysis of manufacturing value added (MVA) in the period 1990 to 2016 shows that industrial output in China took the lead in 2011 and is continuing to grow while the EU's MVA continues to drop.

Numbers affect the politics. Namely, China transformed from very poor, stagnant, centrally controlled, inefficient, and relatively isolated economy to trade and investment open and world's fastest-growing economy. Along with economic growth the strategic importance and bargaining power grew, and China is nowadays almost equally important negotiator as the European Union. The EU has still many propositions and conditions on China, and China is answering by its initiatives e.g. Made in China 2025, Belt and Road Initiative, 17+1 Cooperation etc.

The new situation concerning virus Covid-19 which affects world globally will surely affect the EU-China economic relations. Many manufacturers were left without inputs from China and the question if China is too important as exporter of intermediate goods arose. The EU will definitely consider its dependence on China. Thus, the coronavirus consequences will be seen not only in slowing down (or decreasing) the world economy growth but also in disorganization in global supply chains. Some analysis shows that the industry that will be the most affected is Computers and Electronics, followed by textiles (Demertzis & Masllorens, 2020). This may also mean that China will be more vulnerable and more prepared for new compromises with

the EU. The effects of coronavirus on the EU economy should also be counted in, and it is still to be seen how wide its full consequences will be.

This paper showed the industry level data and thus some questions remain open. Further aspects that can be considered are: (i) the discussion of the inter and(or) intra industrial trade to get a better insight into the EU-China economic relations which would bring more light into political aspect too, and (ii) the study of the post-Covid-19 global economy and the EU-China relations as it is highly possible that coronavirus effects will be considerable. These questions are highly intriguing and remain open for future research.

THE COMPETITIVENESS AND ATTRACTIVENESS OF INVESTMENT ENVIRONMENT IN CROATIA AND EX-COMMUNIST COUNTRIES[1]

ABSTRACT

Increasing competitiveness and attractiveness of investment environment is one of the most important macroeconomic objectives of each national economy. Foreign direct investments have variety of positive impacts on host country: increase of export competitiveness, employment, competition, consumption and GDP, modernization of production equipment, transfer of new technologies and knowledge, filling the state budget through taxation and employee contribution payments, improving corporative culture, preserving jobs in joint ventures with domestic companies and more effective integration of the country into the international economy. In this paper is examined competitiveness and attractiveness of investment environment of Croatia and 21 ex-communist countries in the period 2013–2018. Aims of this research are to determine key drivers to attract FDI and increase competitiveness of investment and overall macroeconomic environment. Through examination of investment environments, this paper aims to determine policies and measures that can be applicable for Croatia and observed ex-communist countries to increase competitiveness and attractiveness of investment and macroeconomic environment. This key policies and measures should enhance economic growth of these countries and faster level of integration into global economy. The methodology is based on a system GMM estimator for dynamic panel data models on a sample covering up twenty two countries. Main results confirm correlation of economic growth, taxation and institutional efficiency on FDI stock in host country. Analysis and results of the model and research are providing recommendations to attract more foreign direct investments and enhance economic growth. Contribution of this research is determination of key drivers of FDI and providing policies and measures for increasing competitiveness of investment and overall macroeconomic environment in Croatia and observed ex-communist countries.

Key words*: FDI, competitiveness, attractiveness, Croatia, ex-communist countries.*

---

1. Introduction

FDI is one of most important growth determinants of national economies and was very important in convergence process of ex-communist countries. Positive impacts of FDI on host company are: increase of export competitiveness, employment, competition, consumption, state budget revenues and GDP, modernization of production equipment, transfer of new technologies and knowledge, improving corporative culture, integration of the country into global economy and trade flows. One of the most important effects is that FDI raises standard of living. New workplaces increase wage levels and it has spillover effects because higher level of consumption increases GDP and budget revenues through taxation. Lehnen, Benmamoun and Thao (2013) concluded that FDI has significantly positive impact on overall welfare in some country. Welfare included: standard of living, education and life expectancy. Due to variety of positive impacts countries are trying to create positive macroeconomic environment to attract FDI. Economic growth is one of key tasks of each government because it ensures macroeconomic stability. Macroeconomic stability was and still is one of key issues of ex-communist countries during their transition processes. FDI is a source of enhancing this process and ensuring economic growth. Globalization as the process that connects the world politicaly, economically, socially and culturally enhanced liberalization of the international trade and technology transfer from developed to developing, transition and emerging economies. Cappello and Peruca (2015) concluded that important determinants of economic growth are openess to globalization, level of education and patents. Openess to globalization is measured through linkages with the world and inclusion in world trade flows. Gurgul and Lach (2014) emphasized importance of economical and social globalization on economic growth of ex-communist countries. Economic globalization is expressed through capital flows, labour and trade restrictions that include taxes and barriers to trade. Social globalization includes information flows, cultural proximity and personal contacts.

FDI is one of key determinants of globalization, economic growth and technology transfer. Multinational companies are drivers of globalization because through FDI and business operations they impact on higher level of global connectivity on all levels. It is important to determine what impacts the decision of investment location. Galović (2017) noted that multinational companies represent most influential economical entities of modern age. They preffer market oriented business activities, while main factors for investment location decision are: economic growth, demand, market structure that enhances competition, fosters investment and creates encouraging macroeconomic environment. Limitation factors for investment decision is any kind of protectionism, economic crisis, financial instabilities and changes in investment climate.

Popescu (2014) emphasized that the role of FDI as a compound collection of capital stocks, know-how and technology is a growth-enhancing component in Central and Eastern European (CEE) countries. It is vital determinant that encourages sustained economic growth. FDI reinforces insufficient domestic funds to finance both ownership alteration and capital composition. It may be a natural component of the catching-up process of these countries and related to macro-financial exposures that intensified the boom-bust cycle in the CEE nations. FDI has more significant impact in Balkan countries then in CEE countries. But, FDI has an essential function in improvement and structural restoration of these economies. Galović, Bezić and Mišević (2018) concluded that FDI can provide income, capital, technology, expertise, and market access. Pan Long (1994) noted that FDI and growth rate are interdependent because higher growth rate attracts FDI, which fosters higher growth rate. Hlavacek and Bal-Domanska (2016) concluded that FDI positively affects economic growth of CEE economies. Problem of all these economies was that they didn`t have adequate resources and technological levels, so their growth was therefore conditioned by major foreign investment. They emphasize that FDI was major source to overcome consequences of economic crisis in period 2009–2012. They confirmed that increasing of FDI stock by 1% caused economic growth of 0,36%. FDI was a

major source of external economic confidence in stability and development of their economy. Stanišić (2008) concluded that FDI has positive impact on economic growth of Southeastern European (SEE) economies. Reasons why he couldn`t find statistically significant evidences for it is because these countries were in transition process and positive effects of FDI couldn`t be visible in that period. FDI is recognized as most important channel of technology transfer. He found strong evidence that FDI improves productivity of domestic companies.

Aims of this research are to determine key drivers that attract FDI and increase competitiveness of investment environment. Based on this, another aim is to suggest key policies and measures for ex-communist countries to increase competitiveness of its investment environment. Countries included in the model are: Croatia, Romania, Bulgaria, Estonia, Lithuania, Latvia, Slovenia, Hungary, Czech Republic, Slovakia, Poland, Serbia, North Macedonia, Montenegro, Bosnia and Herzegovina, Albania, Ukraine, Belarus, Moldova, Georgia, Armenia, Azerbeijan. Main hypothesis of this research are:

1) Ex-communist countries should increase their efforts in creating attractive macroeconomic and investment environment.
2) Efforts should be directed to investment climate and enhancing economic growth.

Section 2 includes literature overview. Section 3 is related to data and methodology. In section 4 is intepretation of results and discusssion. Section 5 provides concluding remarks.

2. Literature overview

In order to become more competitive and to encourage economic growth, countries compete to attract FDI. One of most important question is how a country can increase attractivenes of its investment environment and what will be the effects of FDI. Borensztein, De Gregorio and Lee (1995) concluded that FDI is most important driver of technology transfer to developing economies and strongly positively correlated with economic growth and income growth rate. Moura and Forte (2013) concluded that despite certain negative effects, FDI mainly has positive effects on economic growth. FDI impacts economic growth through transfer of new technologies and know-how, formation of human resources, integration into the global economy, increased competition that causes higher productivity level and firms development and restructuring. They confirmed how FDI and attractiveness of domestic environment depend about: human capital, degree of economic openess, economic and technological conditions, legislation and political stability.

Popescu (2014) emphasized that trade openess and trade liberalization are among most important sources of FDI in transition economies in Central and Eastern Europe. FDI to the Balkans is determined by geographical and institutional circumstances. The overall macroeconomic, financial and institutional condition of the host country is a significant driver of FDI inflows. Pan-Long (2014) concluded that trade openess and higher growth rate can attract more FDI, which fosters higher growth rate and there is an interdependence of this variables.

Deichmann et al. (2003) examined impact of FDI in Czech Republic, Poland, Hungary, Slovakia, Croatia, Slovenia, Serbia, North Macedonia, Bosnia and Herzegovina, Albania, Romania, Bulgaria, Moldova, Latvia, Lithuania, Estonia, Russia, Belarus, Ukraine, Azerbeijan, Armenia, Georgia, Kazakhstan, Kyrgsztan, Uzbekistan, Tajikistan and Turkmenistan. They concluded that FDI has been instrumental in accelerating the Schumpeterian "creative destruction" of old structures in these markets. FDI played critical role in transferring technological, marketing and management know-how, increasing employment, the international competitiveness of the host countries and facilitated their access to world markets. Except geographic location, important determinants of FDI were economic policies that encourage FDI and they are related to economic development, infrastructure, macroeconomic stability and reforms. Dritsaki and Stiakakis (2014) concluded how export and domestic capital

investments had more positive impact on economic growth while FDI didn`t have expected impact on economic growth of Croatia, but reasons are government policies. They recommended to Croatian government to increase efforts in creating better macroeconomic environment for FDI so Croatian economy can benefit from positive effects of FDI. Jovančević (2007) noted how countries of New Europe were benefiting from their integration with the European single market, by opening up new trade and investment opportunities and anchoring macroeconomic and institutional reforms. But their economic growth can`t be explained by level of FDI total inflows. It is more result of economic policies and enterpreneurship existence in these countries. One of the most important determinant to attract FDI and economic growth was declining taxation level, especially corporate taxes. Motivational factors for FDI are general investment climate, perception of political and country risks, effective legal system and judiciary, stability and consistency in government policy. She concluded that unpredictability of economic policies, high tax burden, government`s ability to implement structural reforms, change of laws, and restrictive policies towards FDI were main barriers. Main conclusion of her research is that there were significant inflows of FDI in New Europe countries and result of that was economic growth, but it is correlated with above mentioned motivational factors. Ginevičius and Šimelite (2011) claimed that tax deduction is considered as most important FDI determinant. As a reason why CEE economies received large amount of FDI, they emphasized liberalizing trade and opening economies. They concluded that trade openess is most important driver of FDI in CEEs, while political stability was important driver of economic growth. Mehić, Silajdžić and Babić-Hodović (2013) claimed that FDI has positive impact on economic growth and provided empirical evidence about spillover effects: diffusion of technology, educational attainment, stimulating domestic investment, increasing human capital level, improving institutional environment of host country. They examined an impact of FDI on economic growth of SEE countries. Based on panel data they concluded that FDI and trade openess had positive impact on economic growth of all SEE countries, much more then domestic investments. They emphasized that FDI affects economic growth and higher economic growth rates attract FDI. In order to attract FDI governments have to develop agenda to create positive investment environment by removing legal and regulatory barriers, invest in physical infrastructure and industry zones. Kersan Škabić (2014) concluded that most important determinants to attract FDI in SEE countries are: GDP per capita, market size, growth rates and wages, while lowering taxes didn`t have significant impact. But, she reffered to Hasset and Hubbard (1996) and Mintz (2006) which emphasized that tax regimes are very important determinant to attract FDI, especially in developing countries. Aizeman and Spiegel (2006) reffered to different authors and found significantly positive relationship between institutional efficiency and FDI. Bayraktar (2013) examined effects of Ease of Doing Business that represents investment climate through institutional efficiency on FDI. He concluded that economic growth and Doing Business indicators positively affect FDI, but it doesn`t have to be always the case. For Doing Business indicators more significant correlation is presented in developing economies. Improvements in Doing Business indicators can be one of important factors helping to attract FDI to developing countries.

As it is previously emphasized, FDI represents one of the most important growth determinants of each economy, especially developing, transition or emerging markets. FDI have certain negative effects like: possibility of human rights violations, environmental damages, destruction of small local businesess, potential economic problems. Vissak and Roolaht (2005) claimed that FDI tends to be unstable and difficult to forecast. Annual inflows of reinvested earnings are equally volatile. The irregularities of FDI inflows can destabilize a country's economic development and complicate the application of economic policy instruments. It is especially related to small countries. They reffered to Estonian economy. Some potential problems they emphasized are: possible withdrawal of investments, uneven regional development, fiscal and balance of payments deficits, cultural conflicts, increased unemployment, country`s dependence of foreign technologies and possible influence of

multinational companies influence on domestic government. But, they concluded that FDI had a lot of positive effects on this economies. Tiits (2007) reffered to role of FDI in Estonia. He noted that in process of developing the knowledge-based economy, most small countries are, in comparison with larger countries, under dual pressure. On the one hand, limited resources and the increasing complexity of new technologies prevent small countries from developing R&D infrastructure of sufficient strength. At the same time, due to smaller-scale production and relatively higher current transaction costs, smaller countries have difficulties in competing in low-tech and mid-tech segments of the world market which are increasingly dominated by Asian tigers with their scale and cost advantages, and relative technological strength. FDI is considered as very important growth driver in Estonia and small countries. That is why he concluded that Estonia should start implementing more proactive foreign investment strategy, paying special attention to attracting ICT, biotechnology and nanotechnology related investments. FDI is one of the main growth determinants in Estonia. Hlavacek and Bal Domanska (2016) concluded that FDI had positive effects on economic growth of Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovakia and Slovenia. Hubner (2011) noted that FDI even though, it didn`t reach its full potential was one of most important drivers of economic boom in Azerbeijan. Lee and Tcha (2004) analyzed economic growth of Central and Eastern European economies, Baltic countries and Commonwealth of Independent States. They confirmed that FDI contributed more to economic growth then domestic investments. During initial phase of transformation these countries faced with problem of output declining. FDI was a vehicle to transfer technology and managerial skills and contributed to economic and TFP growth. Campos and Kinoshita (2002) examined impact of FDI on 25 Central and Eastern European and former Soviet Union transition countries between 1990 and 1998. Their main finding was that, in this more appropriate setting, FDI had a positive and significant impact on economic growth as theory predicts.

There are certain determinants that attract FDI in ex-communist countries. Carstensen and Toubal (2003) concluded that main determinants are: low labour costs, market size, differences in GDP per capita, specific financial and fiscal advantages such as the existence of favourable investment and tax regimes, corporate tax rates, method of privatisation, quality of business environment and overall political climate. Jovanović and Jovanović (2017) examined impact of Doing Business indicators on FDI in 27 ex-communist countries. Their analyisis confirmed that there are impacts, but due to insignificance of certain elements it can`t be precisely said that Doing Business indicators affect FDI. Investors are discouraged by bureaucracy. Significant factors were costs of: registering property, construction permit and starting a business. They included taxation and confirmed that there is significantly negative correlation between taxation and FDI. Havrylshin, Meng and Tupy (2016) analyizing 25 ex-communist countries concluded that countries who liberalized and deregulated their economies reached highest level of institutional development and were most successfull in transition process and had attracted more FDI. Bellach, Leibrecht and Damijan (2009) examined eight Central and Eastern European countries. They emphasized that lower taxation and improves in ICT, telecom and electricity infrastructure positively affects FDI.

3. Data and methodology

To examine factors that affect FDI in ex-communist countries, used methodology is GMM two step estimations dynamic panel with asymptotic standard errors function. Judson and Owen (1996) noted that use of panel data in estimating common relationships across countries is particularly appropriate because it allows the identification of country-specific effects that control missing or unobserved variables. Baum and Schaffer (2003) noted that usual approach today when facing heteroskedasticity of unknown form is to use the GMM. It makes use of the orthogonality conditions to allow for efficient estimation in the presence of heteroskedasticity of unknown form. Kiviet, Pleus and Polderman (2017) emphasized that reputation of GMM is

based on its claimed flexibility, generality, ease of use, robustness and efficiency. Widely available standard software enables to estimate models including exogenous, predetermined and endogenous regressors consistently, while allowing for semiparametric approaches regarding the presence of heteroskedasticity and the type of distribution of the disturbances. It is often used when time-series dimension of the sample is not too small.

Two types of dynamic estimators were constructed while using GMM methods: differentiated GMM estimator (Arellano – Bond 1991) and system GMM estimator (Arellano – Bover 1995; Blundell – Bond 1998). Galović and Bezić (2019) in their analysis reffered to Rodman (2009) who claimed that differentiated and system GMM estimators have been created for dynamic panel analysis and have certain assumptions on data generating process, such as:

a) there is a possibility of autonomously distributed individual time-invariant effects,
b) such a situation is contrary to the temporal regression model,
c) some of the regressors can be endogenous,
d) the occurrence must be dynamic in nature, with the realisation of the current dependent variable that is influenced by the variable from former periods,
e) idiosyncratic disorders (except for time-invariant effects) have specific forms of heteroscedasticity, autocorrelation, and
f) idiosyncratic disorders are uncorrelated between individual variables

This paper examines determinants of FDI in 22 ex-communist Central and Eastern Europe and Caucasus countries in period 2013–2018. Countries included in the model are: Croatia, Romania, Bulgaria, Estonia, Lithuania, Latvia, Slovenia, Czech Republic, Slovakia, Hungary, Poland, Serbia, Montenegro, North Macedonia, Bosnia and Herzegovina, Albania, Moldova, Ukraine, Belarus, Georgia, Armenia and Azerbeijan. Model is based on 110 observations.

The dynamic model with a single time-shifted (lagged) variable can be shown by the following equation (1):

$y_{it} = \beta y_{it-1} + u_i + v_{it}, |\beta| < 1$

Where y_{it} represents the value of the dependent variable in period t; y_{t-1} is marked as dependent variable with a shift (lag) for one period from t; u_i indicates individual time-invariant effects, and v_{it} represents the random error. Individual impacts are treated as stochastic. Further assumption that is crucial for the consistency of the model are errors v_{it} which are serially uncorrelated. Individual time-invariant effects are primarily associated with the former impact of the dependent variable of the model, which points to the above-mentioned problem of endogenity.

4. Results and discussion

GMM two step estimator based dynamic panel model is constructed:

$LNForeignd_{it} = \beta_0 + \beta_1 LNForeignd(-1)_{it} + \beta_2 LNDealingwithc\sim_{it} + \beta_3 LNStartingabus\sim_{it} + \beta_4 Corporatetax_{it} + \beta_5 GDPgrowthannual_{it} + \beta_6 LNTimerequired\sim_{it} + \beta_7 LNTimerequiredp\sim_{it}$

$$+ \sum_{t=2015}^{2018} year_t + u_{it} + v_{it}$$

Detailed results of the system two step GMM estimator based dynamic can be found in the table A1 that can be found in appendix.

Table 1: Results of the Dynamic Panel of System GMM Estimator

Source: Author`s calculation

LNForeignd is used as a dependent variable and a proxy for this is FDI stock inward and outward on annual level. The data is taken from database UNCTAD (2020). FDI stocks measure the total level of direct investment at a given point in time, usually the end of a quarter or of a year. As independent variables were used: FDI stock from previous years, institutional efficiency, economic growth and taxation. *LNForeignd(-1)* is used as a proxy for FDI stock inward and outward from previous years. Model includes natural logarythm of FDI stock inward and outward. Values are denominated at current prices in USD. It represents the state of inward and outward foreign direct investment stock respectively in the previous year and, simultaneously, the time-shifted variable. UNCTAD (2020) defines three components of FDI: equity capital, reinvested earnings and intra-company loans. FDI stock is the value of the share of their capital and reserves (including retained profits) attributable to the parent enterprise, plus the net indebtedness of affiliates to the parent enterprise. Doing Business indicators like time needed to get construction permits (*LNDealingwithc~*) and time needed to start a business (*LNStartingabus~*), time required to register property (*LNTimerequiredp~*), time required to get electricity (*LNTimerequired~*) measured in days are taken as proxies for institutional efficiency and investment climate. For all these variables model includes their natural logarythm. World Bank (2020) defines all these indicators. Dealing with construction permits is defined as the time captures the median duration that property lawyers, notaries or registry officials indicate is necessary to complete a procedure. It is calculated in calendar days. Starting a business captures the median duration that business incorporation experts indicate is necessary for five male or female married entrepreneurs to complete all procedures required to start and operate a business with minimum follow-up and no extra payments. It is calculated in calendar days. Time required to get electricity is the number of days needed to obtain a permanent electricity connection. The measure captures the median duration that the electricity utility and experts indicate is necessary in practice, rather than required by law, to complete a procedure. Time required to register property is the number of calendar days needed for businesses to secure rights to property. Data and definitions are taken from World Bank (2020)

database. Corporate tax rate is taken as a proxy for taxation and data is collected through KPMG database. As a proxy for economic growth is taken annual GDP growth rate and data is collected through World Bank database (2020). Stars in the last column of table show significance.

There is an evident significant impact of FDI stock from previous years, time needed to get construction permits, GDP growth annual, time required to get electricity and register property. If value of FDI stock from previous year increases for 1%, value of FDI stock in current year will increase for 0,9839%. If time measured in days needed to get construction permit decreases for 1%, value of FDI stock will increase for 0,062%, and if time needed to get electricity measured in days, decreses for 1%, FDI stock values will increase for 0,0578%. If GDP annual growth rate increases for 1%, value od FDI stock will increase for 0,0043%. Results for GDP annual growth, time needed to get electricity and construction permit are confirmed with 1% significance.

Corporate tax and time needed to start a business measured in days are not stastically significant. If time needed to start a business measured in days decreases for 1%, value of FDI stock will increase for 0,014% and if corporate tax rate decreases for 1%, value of FDI stock will increase for 0,0002%.

Only indicator with unexpected result is days required to register property because it is statistically significant if number of days required to register property increases for 1%, value of FDI stock will increase for 0,017%. Relevant literature can explain such results about effects of Doing Business on FDI. Eifert (2009) examined impact of Doing Business on investment and economic growth. In his research days required to register property and time to export show unexpected result like in this paper what meant that in case days required to register property and time to export increases, FDI value in these countries will increase. He concluded that increasing in investment rates was not related only with the fact if country is well or poor governed. Hossain et al. (2018) examined drivers of FDI in 177 countries from World Bank database, including countries observed in this model. After regression analysis their results opposed to relevant literature. They concluded that FDI in countries increases when indicators registering property and getting credit have lower score, what means that they require bigger number of procedures, days and higher costs of registering property. Jayasurya (2011) explains why such results happen. It is because Doing Business ranking, which represents the formal time and costs involved with fully complying with regulations, may not necessarily translate to the actual experiences of a wide range of firms. Other reason is because observed countries are not homogeneus.

Bellos and Subasat (2009) analyzed transition countries and concluded how poor governance that included bureaucratic quality is correlated with high levels of FDI stock. They explained that reasons for such result are differences of the countries in other determinants that attract FDI like inflation, geographical proximity to other markets, trade openess. Based on results of reffered papers and this one, it can be concluded that effects of Doing Business indicators on value of FDI differ from country to country. In this research observed countries are not homogeneus and that is one of the reasons why certain indicator shows unexpected results. Another reason is importance of other determinants like geographical proximity, market potential, structure of investments, taxation. Unexpected signs of independent variables are not something unusual in researches. Helmy (2013) confirms possibility of unexpected results. He analyzed with two step GMM estimator based dynamic panel 21 countries of Middle East and North Africa (MENA) in period 2003–2009 and concluded there is positive correlation among corruption and FDI.

Model diagnostic doesn`t show autocorellation of second order. Arellano-Bond test is used to examine the existence of autocorrelation of the first (AR1) and the second order of errors (AR2) in the first differences of the equation. The results of Arellano-Bond (2) tests do not indicate

the presence of the second-order autocorrelation due to 0.29 coefficient, which is higher than the allowable limit of 0.05.

The resulting value (Prob>chi2) of the Sargan test amounts to 0.562, which is higher than 0.05. It means that model is satisfactory and precise. The results of the Wald test indicate a sufficient explanatory power of the variables of the model, which is confirmed by the respective significance of the test. The synthesis of the diagnostics results leads to the conclusion that the model is specified in the appropriate manner.

5. Concluding remarks

Regarding relevant literature and databases topic about determinants of FDI in ex-communist countries, especially for period 2013 – 2018 is understudied. Clausing and Dorobantu (2005) confirm in their paper that there is relatively few number of papers that examined determinants of FDI in CEE. Expanding research scope about determinants of FDI in observed countries is one contribution of this paper. Main objective of this paper was to examine determinants of FDI in 22 ex-communist countries in Central and Eastern Europe and Caucasus and to determine policies and measures to improve investment climate in these countries. Results of econometric model confirmed strong correlation of GDP growth and institutional efficiency with values of FDI stock in these countries. Decreasing tax rates and bureaucracy impacts positively on increasing of FDI stock values in these economies with exception of days needed to register property. Main contribution of this paper is determining key factors to attract FDI and increase competitiveness of macroeconomic environment of ex-communist countries.

It is important for ex-communist economies to continue with increasing efforts in creating encouraging macroeconomic environment to attract more FDI. One of main determinants is economic growth. Observed countries need to increase efforts in decreasing bureaucracy to ensure proper infrastructure for foreign investors. Positive correlation of time required to get construction permit and electricity confirmed importance of ensuring infrastructure to foreign investors. Infrastructure regarding relevant literature plays key role in attracting FDI not only in observed countries, but also in other developing, emerging and transition countries. Key reforms should be focused in declining time to get construction permit, electricity and starting a business. Declining number of days can be done through decreasing number of procedures. Investors will be attracted if days required to get construction permit, electricity and start a business decline, and also if corporate tax rates decline. About impacts of taxation on economic growth it is hard to determine is it significant or not. Corporate tax rates directly affect business costs and companies are looking for the locations where business costs are lower. Matić and Marić (2016) recommend reforms to ensure economic growth and attract more FDI. They noted example of Slovakia and its flat tax rate and how it is important to decrease taxation level. They concluded it is important to increase level of economic freedom and that Doing Business indicators are important determinants to attract FDI and increase growth rate.

Used econometric model confirmed main hypothesis that ex-communist countries should increase their efforts in creating encouraging investment and macroeconomic environment. Another hypothesis is that efforts should be directed to investment climate and enhancing economic growth focused, is confirmed because all variables are part of investment climate, especially Doing Business indicators. Statistically significant impact of GDP growth and correlation among determinants of economic growth and FDI from relevant literature confirm that policies and measures should be directed to enhance economic growth. Based on this and all previous researches, it can be concluded that ex-communist countries should be included in world trade and investment flows. That will ensure their economic growth. Policymakers should focus on creating economic policies which decrease bureaucracy and taxation level. That will ensure removing barriers for foreign investors. These countries already implemented

different reforms in order to free their economy and increase level of Ease of Doing Business and attract investors, but these efforts should be continued.

CHALLENGES OF BUILDING EFFICIENT REGIONAL INNOVATION SYSTEMS

ABSTRACT

Rapid globalization has drastically changed the competitive environment and the role of regions. To be competitive in a global knowledge economy, regions should establish a supportive environment for innovation and enable entrepreneurs to compete, on both markets – domestic and foreign ones and to sustain economic growth. It is already recognized that important elements of the process of innovation become regionalized and consequently there is a trend of increasing regionalism in innovation policies which is associated with a number of problems, particularly ones related to potential conflicts between national and regional objectives. Also, regional innovation systems are considered as means of regional development. This approach emphasizes the system and focuses on network and linkage effects in a region, instead of the role of independent actors and activities. The interactions among the actors involved in research, development and innovation are as important as investments in research and development and crucial in translating inputs into outputs. However, the concept of regional innovation systems is relatively new at the policy level and there is a clear need for support in the design of regional innovation systems and policies. This paper examines general issues on the formation of regional innovation systems, summarizes relevant ideas and arguments of issues on national and regional innovation systems and examples of best practices from the European Union to provide a basis for policy and institutional design of efficient regional innovation systems. Understanding regional innovation systems can help policymakers develop approaches for enhancing innovative performance in the knowledge-based regions of today.

Key words: *innovations, regions, European Union.*

1. Introduction

The national innovation system became an important part of national industrial policies (Lundvall, 1992; Lim, 2006) since innovation has become a crucial factor of development and competitiveness (Buesa et al., 2010; D'Allura et al., 2012; Őnday, 2016; Aragón Amonarriz et al., 2019). However, innovation context differs substantially, not only between different countries, but also between regions within a single country (Tödtling et al., 2012).

Rapid globalization has drastically changed the competitive environment and the role of regions. It is regions that are competing with each other in the global economy (OECD, 2013) and therefore emphasis is put on the regional dimension of innovation (Ponsiglione et al., 2018). Annoni and Dijkstra (2019) define regional competitiveness as the ability of a region to offer an attractive and sustainable environment for firms and residents to live in and work.

There is a trend of increasing regionalisation of innovation policies which brings new and different challenges to innovation systems that weren't present there before. Regional

innovation systems have an important role in economic development policy (United Nations Industrial Development Organization, 2003). This is the reason why knowledge and understanding of these challenges is necessary. Partly, regional innovation systems as a concept became so popular due to the increased international competition (Doloreux and Parto, 2004). Regional innovation systems are considered to be a new model for regional development (Lim, 2006). These systems impact innovation at a regional level, hence the level of competitiveness of a region (Önday, 2016). Consequently, over the past two decades, studies regarding regional innovation systems have gained increased attention (D'Allura et al., 2012).

In defining regional innovation systems, one should start with the definition of the "region". The most commonly used criteria in the definition of a region are: determinate size; homogeneous in terms of specific criteria; it can be distinguished from bordering areas by its features and internal cohesion (United Nations Industrial Development Organization, 2003). The concept of innovation is related to the analysis of processes of technological change which consist of three stages: invention, innovation and diffusion (United Nations Industrial Development Organization, 2003). Innovations are considered to be the result of a complex set of relationships among actors producing, distributing and applying various kinds of knowledge (OECD, 1997). It is considered that regional innovation system consists of six sectors: (1) business sector (SMEs and large companies); (2) state sector (the bodies of national and regional executive authority administering activity in support of innovation); (3) scientific-research sector; (4) sector for technology transfer and mediation (techno parks, business incubators, clusters, etc.); (5) public sector (civil society) and (6) partner sector (foreign partners in innovation activity) (Lyasnikov et al., 2014). In order to make a successful regional innovation system, region should map all the stakeholders and create an appropriate framework for coordination and agenda (Technopolicy Network, 2007).

There is a growing relevance of the topic of regional innovation systems and literature relating to it proliferated in the last decade, introducing different definitions of a regional innovation system (Runiewicz-Wardyn, 2009; Pino and Ortega, 2018).

An innovation system can be defined as a system that involves a number of different actors and their interactions (OECD, 2015). The structure of stakeholders and system elements differs between countries and over time, which proves that such a system is a dynamic category. Lack of collaboration and connectivity between system participants, inconsistency of basic public sector and applied research in industry, malfunctioning of institutions in charge of diffusion of technology and information, and lack of absorption capacity of enterprises can contribute to the inefficient functioning of the innovation system and, consequently, a country's low innovation rate (Bilas and Franc, 2017). An effective national innovation system is most commonly defined as a network of private and public sector institutions and organizations that interact to initiate, import, modify and disseminate innovation (Lundvall, 2005).

A regional innovation system is a set of institutions that (jointly and individually) contribute to the development and diffusion of new technologies (Metcalfe, 1995; Technopolicy Network, 2007). Regional innovation systems are usually understood as a set of relationships among private and public interests, formal institutions and other organizations with the purpose of generation, use and dissemination of knowledge (Doloreux, 2003; Doloreux and Parto, 2004). Lim (2006) defines regional innovation system as a system stimulating innovation capabilities of firms in a region in order to facilitate the region's growth potential and regional competitiveness. A regional approach to an innovation system usually involves a region within a country and observing the links between technology, innovation and industrial location (D'Allura and Mocciaro, 2012). A regional approach to the innovation system was developed

by experts in the field of economic geography who sought to explain the role of institutions and organizations in the regional concentration of innovative activities (Asheim et al., 2003).

This paper examines general issues on the formation of regional innovation systems, summarizes relevant ideas and arguments of issues on national and regional innovation systems and examples of best practices from the European Union to provide basis for policy and institutional design of efficient regional innovation systems. It contributes to the literature on regional innovation systems and analysis of relationships between innovations and economic performance of particular regions.

Paper is structured into four parts. After the introduction, brief literature review is presented in the second part. Third part of the paper refers to the European Union experiences and discussion. Conclusion is presented in the fourth part of the paper.

2. Literature review

Literature review is organized around (1) the origin and features of the concept of regional innovation systems, (2) factors and barriers of successful functioning of regional innovation systems, (3) regional innovation systems governance and (4) the role of the smart specialization strategies for the regional innovation systems.

Firstly, the origin and features of the concept of regional innovation systems are discussed. The origin of the concept of regional innovation systems lies in two main directions of literature, literature on systems of innovations and literature on regional science which both increasingly recognize that important elements of the process of innovation are becoming regionalized (Doloreux and Parto, 2004). Doloreux and Parto (2004) point out some of the key features: innovation occurs in an institutional, political and social context and region is the site of innovations. They stress the role of regional clusters due to the fact that innovation occurs more easily when geographical concentration and proximity are present. Literature on innovations and knowledge spill overs, as well as regional innovation systems, stresses the role of clustering for innovation and gaining international competitiveness. Eraydin and Armatli-Köroğlu (2005) found that industrial clusters can be internationally competitive and the sources of externalities and competitiveness are defined by local conditions. Additionally, the Technopolicy Network Model contains the following main building blocks of a regional innovation system: talent; investment system; research and development (R&D); entrepreneurship facilities and organising capacity (Technopolicy Network, 2007). Talent refers to entrepreneurs, students and researchers with good ideas. Investment system refers to the presence of capital providers for start-ups. R&D refers to existence of good universities and research institutes as locations of creating knowledge. Entrepreneurship facilities refer to existence of entrepreneurial infrastructure like incubators, technological parks, etc. Organising capacity refers to the ability of coordination of activities of all stakeholders, not only to the leadership and top-bottom approach. Strong R&D base is a prerequisite for a strong regional innovation system (Technopolicy Network, 2007). Regional innovation system approach underlines the regional dimension of the production and the exploitation of new knowledge (Őnday, 2016). The increasing globalisation of innovation is forcing regions to think beyond their borders and to strengthen cooperation - so called cooperation for competition (OECD, 2013). It is considered that a strong cross-border regional innovation system can better take advantage of global networks. However, not every neighbouring region is an adequate candidate for cooperation. There are different rationales for cross-border collaboration for innovation policy (OECD, 2013): economies of scale, economies of scope, public goods and externalities, which are explained in the following text. Within the concept of economies of scale there can be different drivers, for example access to larger labor markets and knowledge networks, or more

specialised and higher quality innovation support services, etc. Within the concept of economies of scope, the main driver could be complementarity in terms of research, technology and economic base, as well as supply chain linkages. Within the concept of public goods, main driver could be sharing specialised infrastructure such as technology parks, etc., attractiveness of the area to firms through regional branding and regional identity in terms of recognising cross-border area for social capital it possesses. Within the concept of externalities, border issues for gaining positive spillovers are one of the potential rationales for cross-border cooperation. It is often pointed out that a regional innovation system is not necessarily the same as the administrative entity and that openness to cooperation is necessary (Technopolicy Network, 2007). Pino and Ortega (2018) found the question of brining the concept of sustainability to the innovation system theory a question of arising interest in the latest literature on innovation systems.

Secondly, factors and barriers of successful functioning of regional innovation systems are discussed. The world economy has become a very complex system and it is undoubtedly necessary to strengthen the human capital that has new knowledge, is constantly improving and using the latest technologies in order to maintain its global position and competitiveness. In addition, there are many factors that influence the development of an innovation system - institutions and infrastructure for innovation system development, absorption and innovation capacity, clusters of innovative enterprises and innovation networks (Bilas and Franc, 2017). Koschatzky and Kroll (2009) argue that regionalisation of innovation policies is related to problems of multi-actors and multi-levels of governance of innovation at regional level, but believe regional governments can succeed in relating scientific and business sectors in order to achieve set goals. They also point out, besides the autonomous decision making, need for necessary financial resources to pursue promotional measures as one of the key factors for successful regional innovation systems. Cooke et al. (1998) found that strong governance is important, but not sufficient condition for functioning regional innovation systems. United Nations Industrial Development Organization (2003) advocates a combination of public and private governance at a regional level to promote systemic innovation. It points out there are issues related to regional innovation systems: (1) limited budgets and responsibilities of regional governments which leads to not using all available innovation policy instruments, (2) limited experience and best practice experiences and (3) insufficient knowledge on innovation needs of the business sector. Ponsiglione et al. (2018) advocate an agent-based model to support the development of self-sustaining regional innovation systems. They identified the following key factors that influence regional innovation performance: exploration capacity, propensity to cooperation and competencies of actors. Accordingly, policy measures should incentivize investments in research and development activities, support public-private partnerships, enhance university systems and increase the number of researchers employed. At the regional level, it is explained that the innovation capacity of enterprises is influenced by two factors (Camagni and Cappello, 1997). The first factor is the regional agglomeration, which facilitates a collective learning process which then ensures better diffusion of information, knowledge and best practices. Another factor is localized manufacturing systems that help reduce the costs and risks associated with innovation by being distributed across the region through the operation of customer and supplier networks, technology transfer agencies, trade associations and the like. It is therefore clear that the institutional environment influences the development of innovation through three basic functions: reducing uncertainty by providing information, conflict management and cooperation and providing incentives (Edquist, 1997). Furthermore, Holl and Rama (2007) found that network-based policies may contribute to increased levels of innovation in regions. According to Tsipouri (2019) regions need to ensure the basic infrastructure, invest in digital education and create synergies. Fritsch and Slavtchev (2007) found inverse "U" relationship between sectoral specialization and the performance of regional innovation system which indicates that if a certain level of

specialisation is achieved, further concentration in respective industry is not favourable for the regional innovation system. There is a growing awareness of the heterogeneity of key factors, mechanisms and actors relevant for a successful functioning of regional innovation systems in various regions (Tödtling et al., 2012). European Commission (2006) introduced constructing regional advantage (CRA) concept, taking into account this awareness of the heterogeneity. CRA provides a strategic framework for regional innovation policies in less developed regions. It is constructed under the assumption that regions are proper areas for creating innovations. Also, key components of CRA are innovation, talent formation and attraction, and entrepreneurship (European Commission, 2006). Literature defined different gaps that limit the efficiency and effectiveness of regional innovation systems: managerial gaps, structural holes, innovation gaps and valleys of death (Aragón Amonarriz et al., 2019). Managerial gaps refer to a lack of SME managerial capabilities, while structural holes refer to a lack of inter-firm cooperation toward innovation. Innovation gaps occur when there is no effective technology transfer mechanisms and valleys of death refer to difficult commercialisation, or the lack of connection between policy and financial agents (Aragón Amonarriz et al., 2019).

Thirdly, on the issue of governance, Adeyeye et al. (2018) found that barriers which affect innovative performance are both exogenous and endogenous to the firms. Exogenous barriers include regulatory constraints and lack of infrastructure, and these are the issues which require policy actions.

Finally, the need to strengthen competitiveness also imposes the need for development strategies with a focus on building sustainable strengths based on unique resources, capabilities and skills, understanding and following technological and market trends (Aranguren and Wilson, 2013). Njøs and Fosse (2018) examined whether policies should be targeted towards the organizations in regional innovation system (the actor level) or the support structure (the system level) and found that learning outcomes were linked to the a priori experiences with innovation and R&D at both levels. Related to the need to develop regional strategies, the concept of smart specialization has evolved which includes vertical measures and targeted policies that identify and select areas desirable for intervention. It is precisely the focus on vertical measures and the selection of priorities that should result in the effects of specialization and is a key change over previous strategies for fostering innovation (Foray and Goenega, 2013). Smart specialization has a strong regional dimension. Regions are increasingly important as a source of innovation activities, and innovation policies are drawn up at the level of regions, taking into account the strengthening effects of an agglomeration economy. Smart specialization offers opportunities for economic transformation of regions based on strategies that link action to goals (OECD, 2013): to ensure differentiation and a unique market position based on resources and available capacities; ensure the differentiation and unique position of the activities and conditions offered by the region; link economic goals to social and environmental challenges; enable experimentation, creativity and rapid adaptation of strategies to changing conditions and ensure commitment and involvement of all participants.

3. Overview of the European Union experience and discussion

Innovation has been recognized as a key factor for the EU development (Hajek and Henriques, 2017). For creating and implementing policy mix to support innovations, regional innovation performance serves as an important indicator. Similarly, Buesa et al. (2010) claim innovatory capacity is a critical factor for the European Union's economic growth. They found that innovative firms and the environment in which they are situated are determinants of regional innovation in the European Union.

Cooke (1992) concluded long ago that there is no other choice for Europe but to meet new imperatives of competition. Still, Europe is finding its way to compete. The fact that economic disparities between European regions are significant (Tsipouri, 2019) makes it more difficult.

Framework analysis on the concept of regional innovation systems consists of two different sets of analysis: (1) comparative analysis of various regions with the purpose to define desirable criteria for successful regional innovation systems and (2) analysis of individual regional innovation systems to identify unique characteristics of each regional innovation system context to see whether there is a possibility to generalize dynamics of successful regional innovation systems (Doloreux and Parto, 2004).

The European Union has implemented regional innovation system programs for many regions (Lim, 2006).

Navarro et al. (2008) differ regions according to their level of economic and technological development, as well as, sectoral specialisation. From that point of view, they identified seven types of regional innovation system for the 186 regions of the EU25 countries: (1) restructuring industrial regions with strong weaknesses; (2) regions with a weak economic and technological performance; (3) regions with average economic and technological performance; (4) advanced regions, with a certain industrial specialisation; (5) innovative regions, with a high level of economic and technological development; (6) capital-regions, with a certain specialisation in high value-added services and (7) innovative capital-regions, specialised in high value-added services. They found clear differentiation between regions with a notable industrial profile and regions with a strong either agricultural or service sector, and accordingly, regions should create on different knowledge bases. Also, in order to foster the economic and technological development of less developed regions, overall increases in their productivity growth and income per capita levels may yield the best results.

Tsipouri (2019) examined innovation in less-developed EU regions with low institutional capacity and found innovation results from the combination of investments and technology institutions combined.

Full innovation potential of EU regions needs to be mobilised in order to reach Europe 2020 goals (European Commission, 2010).

There are two frameworks to measure performance of the EU regions, via Regional Competitiveness Index and via Regional Innovation Scoreboard.
Regional Competitiveness Index (RCI) 2019 measures the performance of 268 NUTS2 regions of the EU28 countries through 11 dimensions of competitiveness: (1) national and regional institutions, (2) macroeconomic stability, (3) infrastructure, (4) health, (5) basic education, (6) higher education and lifelong learning, (7) labour market efficiency, (8) market size, (9) regional and national technological readiness, (10) business sophistication and (11) innovation (Annoni and Dijkstra, 2019). Regions can use RCI to make a comparison with any other region in the EU or with the EU average. The top performer according to the RCI 2019 is the region of Stockholm, followed by London and Utrecht, and the worst regions were one region in Greece, one in Romania and the French outermost regions of Mayotte and Guyane (Annoni and Dijkstra, 2019). Table 1 presents top 5 regions and bottom 5 regions.

On the other hand, Regional Innovation Scoreboard (RIS) provides a comparative assessment of performance of innovation systems across 238 regions of 23 EU member states, Norway, Serbia, and Switzerland. Cyprus, Estonia, Latvia, Luxembourg and Malta are included at the country level, as in these countries NUTS1 and NUTS2 levels are identical to the country

territory. The RIS2019 is a regional extension of the 2019 European Innovation Scoreboard (EIS). Innovation performance is measured using the Summary Innovation Index which is a composite indicator, based on 27 indicators. These indicators are grouped into four main types and 10 innovation dimensions: (1) framework conditions (human resources; attractive research systems; innovation-friendly environment); (2) investments (finance and support, firm investments); (3) innovation activities (innovators, linkages, intellectual assets) and (4) impacts (employment impacts, sales impacts) (European Commission, 2019).

Therefore, similarly to the methodology of EIS, regions are divided into four groups: (1) regional Innovation Leaders (38 regions in 2019 with performance more than 20% above the EU average), (2) regional Strong Innovators (73 regions in 2019 with performance between 90% and 120% of the EU average), (3) regional Moderate Innovators (97 regions in 2019 with performance between 50% and 90% of the EU average) and (4) regional Modest Innovators (30 regions in 2019 with performance below 50% of the EU average) (European Commission, 2019). All Regional Innovation Leaders belong to countries identified as Innovation Leaders or as Strong Innovators in the EIS. According to the RIS2019, Helsinki-Uusimaa (Finland) is the most innovative region in the EU, followed by Stockholm (Sweden) and Hovedstaden (Denmark) (Table 2). Interestingly, two most innovative regions in Europe were not in the EU, but located in Switzerland.

Table 1: Regional Competitiveness Index 2019 - top 5 regions and bottom 5 regions

Rank	Top 5 regions			Bottom 5 regions		
	Country	**Region name**	**RCI 2019 score (0-100)**	**Country**	**Region name**	**RCI 2019 score (0-100)**

Regional Innovation Index
Source: European Commission (2019), p. 19-20

Cooke et al. (1998) argue that Structural Funds should present main tool for promotion of systemic regional innovation in less developed regions. Tödtling et al. (2012) found on the sample of three regions in Czech Republic that the EU support via Structural Funds was the most important factor in the implementation of innovation strategies in all three regions.

Runiewicz-Wardyn (2009) found that European regions have weaker regional clusters and cluster portfolios compared to their competitors, which can be an obstacle to gaining and maintaining international competitiveness.

The European Union has included smart specialization in parts of regional innovation policies and strategies. Today, regional innovation strategies for smart specialization are integrated, area-oriented strategies that (OECD, 2013): focus public goods on innovation and the development of priorities, challenges and needs; emphasize measures to encourage private investment; encourage participation and involvement of all participants and new forms of governance; include surveillance and assessments, and are evidence-based. Smart specialization fosters diversity, which means that there may be multiple priority areas in a region at a time. Although the concept can be applied in every region, it is important to emphasize that regions across the EU differ greatly in their economic and institutional context. According to the available data from the Smart Specialisation Platform, there are around 120 smart specialisation strategies developed in the European Union by member states and regions (Gómez Prieto et al., 2019). McCann and Ortega-Argilés (2016) consider that smart specialisation has played an important role in EU regional development policies.

Blažek and Kadlec (2018) examined the relationship between the structure of R&D systems in European regions and the structure of their knowledge base, on the one hand, and their socioeconomic development and innovation performance on the other hand. They found that European regions are integrated into the global economy in sharply differing modes and that that the differences among the European regions in their prevailing knowledge base, as well as

in the absolute and relative sizes of key R&D segments, are systematic and mutually interwoven.

4. Conclusion

Understanding of regional innovation systems can help policy makers develop approaches for enhancing innovative performance in the knowledge-based regions of today. Successful regional innovation system needs systemic linkages between external, as well as internal, sources of knowledge production and business sector. Today, these systems are a very important tool of a balanced regional development. When taking policy actions, regions should take into account their specific conditions – level of economic development, production specialisation and knowledge base, as well as other factors, in order to implement strategies to reach higher levels of development.

Measures of innovation performance across the EU regions show large differences. This fact, without convergence of less developed regions, can become an obstacle for the EU in achieving and maintain competitiveness. Being able to measure their performances and benchmark them is a very important tool in tailoring further policy instruments. One of the sound policy instruments, which are taking into account geographical dimension, in helping regions foster innovations and establishing functional and successful regional innovation systems, are smart specialisation strategies, which are already implemented across some 120 regions. It is too early to evaluate the results, but having these strategies as the basis for EU financing seemed to be very helpful in some regions when it comes to improving innovation performances.

Further research may include more detailed countries/regions case studies and empirical evidences from global companies.

THE BRANDING OF POŽEGA-SLAVONIA COUNTRY BY MEANS OF INTEGRAL QUALITY MANAGEMENT OF A TOURIST DESTINATION

ABSTRACT

The purpose of this paper is to examine the way in which tourist destinations, understood as complex tourist spaces including different resources and stakeholders, and defined by the relationship between the local community, attractions and tourists, approach the process of branding by using the model of integral quality management..
Methodology - Primary research is conducted by examining the attitudes of key stakeholders in private tourist sector who create and launch tourist products in Požega-Slavonia County, the examination of public workshops and audit, as well as the study of strengths and weaknesses of its tourist business entities. The results of the research, presented in this paper, are formulated on the basis of the data collected and analysed in this manner.
Contribution - Investigating strengths and weaknesses and analysing the image of a destination are the first steps in the creation of a tourist destination brand. Complementary advantages, nature, climate, geographical position, monuments, are no longer enough. A tourist destination not managing its quality development is left to its own resources, and faces the threat of losing its attributes in the future. This paper illustrates the process of quality management of a destination on the example of Požega-Slavonia County, the goal of which is to define the standard and criteria of quality, named regionally Zlatna Slavonia (Golden Slavonia). The interconnectedness of the offer, information, the development of the destination product, the offer of local products, and a systematic and continued education are goals in establishing integral quality management system of a tourist destination.

Key words: *tourist system, branding, tourist destination, integral quality management, Požega-Slavonia County.*

1. Introduction

Managing the development and quality of rural tourism, as well as the branding of the rural tourism region, is a complex process as it involves a larger number of stakeholders involved in the provision of tourism services and it integrates different activities into a single tourism

product or service (Davis and Morais 2004; Cawley and Gillmor 2008; Krajinović and et al., 2011) In order to achieve all the positive effects of rural tourism on local community development, establishing an integrated quality management requires a strategic approach to rural tourism development, which has not been achieved in many other rural areas (Davis and Morais, 2004). A tourist destination is conditioned by the wishes, preferences, interests and needs of tourists (Vukonić and Čavlek, 2001). The tourist destination from the point of view of tourists should represent a tourist organized and marketable spatial unit, which with the set of its tourist products offers consumers complete satisfaction of the tourist need. It is not the size and administrative boundaries that determine the tourist destination, but its ability to attract tourists and meet their tourist needs and to create a desire to return. Managing the development and quality of rural tourism, as well as the branding of the rural tourism region, is a complex process as it involves a larger number of stakeholders involved in the provision of tourism services and integrates different activities into a single tourism product or service (Davis and Morais 2004; Cawley and Gillmor 2008; Krajinović and 2011). The very idea of an integral quality management (IQM) of a tourist destination stems from the need for qualitative destination management, with defined standards and quality criteria. Unlike the traditional approach to quality management, which mainly applies to individual tourism companies, destination integrated quality management implies equally meeting the needs of visitors, locals and all involved in tourism developments. This paper will outline the activities and efforts of the Požega-Slavonia County, which carries out in its area activities related to raising the quality of the destination and branding called Golden Slavonia. This is an area that covers the administrative boundaries of the Požega-Slavonia County, that is, the cities of Požega, Pakrac, Pleternica, Lipik, Kutjevo, Velika Municipality are actively involved. The project included all tourist boards in the Požega-Slavonia County as well as 100 business entities operating in the area. For the purposes of this paper, the views of business entities on the development of tourism in the Požega-Slavonia County, information of the local population and potential tourists were comprehensively explored on the tourist offer of the county, networking of tourist entities with educational activities.

This research identified the key shortcomings in the tourism development of the Golden Slavonia region. In the first place, this is the absence of the Tourism Development Strategy of the region of Golden Slavonia, and secondly, it is a heterogeneous and fragmented tourist offer with no significant recognition on the international tourist map. Given that rural tourism is dominated by small businesses with limited human resources in terms of staffing and knowledge, there is often no strategic approach to regional management. The main drawbacks identified are that tourist entities are market-independent, perceived as competition, and appear individually. Due to limited financial resources and strong competition in the market, they are not recognizable and competitive. Previous tourism development in Požega-Slavonia County is largely left to individual entrepreneurial initiative and scarce sources of financing. Recognizing this, the public local self-government in cooperation with the regional, which is considered to be the most suitable for coordination in establishing the model of integrated quality management, begins the establishment of the project IQM Destination Golden Slavonia. The goal of the project is the establishment of an integrated quality management system, ie the systematic promotion and implementation of quality management in the destination. The focus of IQM Destination Golden Slavonia on the principles of sustainable tourism development is the systematic encouragement and implementation of quality management in the destination, joint cooperation, synergy in the destination, communication and the impetus for quality. Local and regional values thus defined, which will surely lead to recognition and success in the branding of the Golden Slavonia region in the future.

2. Literature review

Studying the world and domestic literature, it is concluded that there is no unified understanding of the concept of tourist destination and that it has changed over the course of history from the concept of limited administrative borders to the concept that has the basis of cooperation between different interest groups in order to manage tourism supply and demand. . Based on the analysis of numerous definitions of a tourist destination for the purposes of this paper (Butler 1980; Vukonić 1995; Cooper et al. 2000; Magaš 2008; Križman Pavlović 2008; Birkić 2016) it is considered appropriate to define it as a tourist organized and marketable spatial unit, which offers consumers a complete set of tourist products to meet their tourist needs. The tourist destination is conditioned by the desires, skills, interests and needs of tourists (Vukonić and Čavlek, 2001). From the above it can be concluded that the size and administrative boundaries are not important for defining a tourist destination, but its ability to attract tourists and satisfy their tourist needs and create a desire to return.

The focus of the tourist destination is the portfolio of experience of the observed destination, that is, a space that contains some potential promises and certain efforts that need to be conceptually and standardizatonally delivered to tourists, as presented. In this sense, there are two essential and perceptual transitions from:

• Destination product to destination experience

• Destination marketing to destination management.

When it comes to quality, we are aware that there are so many definitions of quality. Quality is the goal because organizations, in this case tourist destinations, have to respond very precisely to the needs and expectations of visitors and tourists if they are to be competitive in the market. According to Avelina Holjevac (2002), quality is the level of satisfaction of the needs and demands of consumers, ie compliance with their increasing demands and expectations.

When creating a brand of a particular tourist destination, it is very important to keep in mind how tourists will understand, perceive, feel and evaluate it. Owners and managers of tourist facilities in rural areas can, depending on the motives of the tourists, develop and adapt the tourist supply and can direct the marketing communication. Furthermore, knowledge of tourists' motives plays an important role in predicting tourists' expectations and improving the quality of service. The motives for the arrival of tourists to rural destinations are multifaceted (Davesa et al., 2010): getting to know authentic rural spaces, watching nature, rest and relaxation, escape from stress and noise in urban areas, playing various outdoor sports, enjoying an authentic enogastronomic offer.

Depending on the nature of the destination, which is made up of different attractions and thus a set of tourist services, the destination is a set of services that means a tourist product for tourists and visitors. Tourist demand will always be higher for those destinations that offer tourists specialized products and services, which have a well-established and recognizable tourist brand.

For a successful and unique branding of a destination, it is important to know who are the holders of the tourist supply, what is their role, what are the attractiveness of the destination and how the destination can be different from the competition. In terms of destination branding, there are no two equal approaches and no unique formula for success. In any case, conscious and planned activity of directing development in a certain area and understanding of the destination as a tourist product is important. In the branding process, it is crucial to reflect on the expectations, perceptions, associations and thoughts that tourists have in relation to the tourist destination, which helps the destination to relate to certain characteristics and characteristics found in the destination that make it distinctive, different from other destinations. In this way, the tourist destination can easily find channels for selling its products, it is easier to reach more visitors and tourists, the best workforce and more investments. Branding a

destination and creating a successful destination brand prevents it from losing its attractiveness even in the times of crisis.

A strategic approach to development is not enough to implement only at the level of individual providers, but also at the level of the whole destination and at the regional and national level. As different stakeholders from the public, private and civil sectors participate in rural tourism, stakeholder networking and an integrated approach to rural tourism development are required (Cawley and Gillmor 2008), thus enhancing the very process of branding and creating a quality tourism product. The success and branding of rural tourism is largely dependent on the willingness of the local community to participate and support the development of the rural destination (Quaranta et al. 2016). According to Đurkin et al. (2017), Community based tourism (CBT) involves the management, control and development of tourism by the local community and has many benefits such as increased local community income, local employment, capacity building and local community cohesion . Thus, Murray and Kline (2015) consider that the integration of local producers in rural tourism is of strategic importance for the revitalization of rural areas because it brings a number of positive effects on the success of rural tourism business and the entire local community. Managing the development and quality of rural tourism, as well as the branding of the rural tourist region, is a complex process as it involves a larger number of stakeholders involved in the provision of tourism services and integrates different activities into a single tourist product or service (Davis and Morais 2004; Cawley and Gillmor 2008; Krajinović and et al. 2011) In order to achieve all the positive effects of rural tourism on local community development, establishing integrated quality management requires a strategic approach to rural tourism development, which has not been achieved in many other rural areas (Davis and Morais, 2004).

However, despite the intense growth of both supply and demand in rural tourism areas, there is still insufficient research addressing the various aspects of rural tourism service provision (Hurst et al. 2009, Kljaić Šebrek 2020). Thus, Hurst et al. (2009) consider that access to quality of services is a key determinant of the competitiveness of rural tourism in an area. According to Rozman et al. (2009) and Kljaić Šebrek (2020) the quality of services in rural tourism is a decisive element in choosing a rural destination.

Irrespective of the type of tourist destination, there are several key components of 6A, which are necessary for each destination (Trošt, 2012: 81) and the very condition and connection of these key components influences the quality and image of the tourist destination. Those are :

1.Atractions - imply natural and social attractions that are important to ensure the initial motivation of tourists to arrive at a destination;

2. Reception facilities/Amenities - includes accommodation and catering facilities, shops, entertainment facilities and other services;

3. Accessibility - refers to the development and maintenance of efficient transport links with broadcast markets (international transport terminals and local transport);

4. Available packages – refers to a package - arrangements prepared in advance by sales agents and their agents;

5. Activites - refer to all available activities in the destination and what the consumer will engage in during their stay in the destination;

 6. Ancillary service - involves marketing, development and coordination activities carried out by a specific tourist destination management organization for the needs of consumers and industry.

In order to achieve successful branding of a tourist destination, the brand must be revived for all visitors and tourists arriving or intending to come to the destination. Through the branding process, the tourist destination itself becomes a recognizable tourism product as a whole. The process of building a tourism brand is time-consuming and demanding, but also cost-effective. Without quality management, or rather quality development, the tourist destination is left to

random, chaotic construction, maximum utilization of resources, threatening to lose all attributes of attractiveness in the future. The very idea of an integral quality management (IQM) of a tourist destination stems from the need for qualitative destination management, with defined standards and quality criteria. Supply networking, information networking, destination product development, local product certification are encouraged, and a local product supply system is being established. Unlike the traditional approach to quality management, which mainly applies to individual tourism companies, destination integrated quality management implies the equal satisfaction of the needs of visitors, locals and all involved in the tourism sector (Cetinski, 2005). The European Commission defines integrated quality management as a systematic effort for internal and external quality, ie economic progress in the short term and local development in the long term.

The goal of the Požega-Slavonia County branding project through the integral quality management of a tourist destination called IQM Destination Golden Slavonia is to systematically encourage and implement quality management in the destination, collaboration, destination synergy, communication and the impetus for quality, to establish a competitive tourist offer of Požega-Slavonia County or destination Golden Slavonia and make the destination more recognizable and stronger on a regional, national and international level. Today, with 20718 tourist arrivals and 46 245 overnight stays (CBS, 2019), she is certainly not. In the total tourist traffic of the continental Republic of Croatia excluding the City of Zagreb, the Požega-Slavonia County accounts for only 1.5%, and the average stay of guests is 2.3 days (CBS, 2019). The emphasis is on innovation, creativity and connectedness, which in the project IQM Destination Golden Slavonia connects private and public partnerships in the destination and the environment, with all partners influencing quality in tourism. Cooperation with national (Ministry of Tourism, Croatian National Tourist Board, CCC) and international institutions (EC, UNWTO) and all destination entities is encouraged in order to exchange knowledge, experience and improve the service.

3. Research methodology

The research data represented here is secondary-collected, quantitative and descriptive. The research for the purpose of this work was conducted in the Požega-Slavonia County, which carries out in its area activities related to raising the quality of the destination and branding called Golden Slavonia. This is an area that covers the administrative boundaries of the Požega-Slavonia County, that is, the cities of Požega, Pakrac, Pleternica, Lipik, Kutjevo and Velika municipality are actively involved. The project also includes all tourist boards in the Požega-Slavonia County as well as 100 business entities operating in the area, divided into several groups as follows: business entities providing accommodation services, private renters, public institutions, catering establishments - restaurants and bars, local producers - wineries, tasting rooms and pubs, family farms, travel agencies, wellness and carriers of tourist supply through attractions.

Source: authors

The participants of the IQM Destinatination Golden Slavonia project are also the respondents whose research findings will be presented in this paper. The empirical part of the paper used the method of collecting primary data through a survey, in paper form and online. The survey was conducted from May to September 2019. A standardized survey questionnaire was used. The survey is aimed at owners and managers of business entities that are holders of the tourist supply and who participate in the creation of tourist products and services in the County of Požega-Slavonia. In the first phase of realization of the Golden Slavonia brand in the area of Požega-Slavonia County, an audit of business entities was carried out, which lasted from 5 months in 2019 to January 2020. The audit team consisted of four members where each team member was in charge of a specific area from internal and external arrangement of the facility, catering, marketing to finance. The analysis of business entities' websites as well as their activities on the internet and their presence on social networks were also conducted. In this way, the attitudes of business entities on the development of tourism in the area of Požega-Slavonia County, information of the local population and potential tourists on the tourist offer of the County, networking of tourist entities, education were comprehensively researched. Willingness to promote these activities related to digital marketing of businesses will not be the subject of this work due to the limited space of the work itself.

Based on the data thus collected and processed, the survey results are formulated and presented below. Desk method, for the purpose of this paper, collected secondary data: number and structure of tourist accommodation capacities in Požega-Slavonia County in the period 2016 - 2019 and number of realized tourist arrivals and overnight stays in the period 2016 - 2019.

4. Results of research and discussion

In this chapter the information on existing accommodation facilities in the County of Požega-Slavonia, as well as information on tourist developments, are presented.

Table 2: Accommodation overview of Požega-Slavonia County, town of Požega

	2016.	2017.	2018.	Index 2018/16
Republic of Croatia	1 133 751	1 207 422	-	106

Požega-Slavonia County	601	674	1061	176

Source: (DZS, 2019)

According to the data of the Požega-Slavonia County Tourist Board, accommodation facilities in Požega-Slavonia County in 2019 have a total of 1061 beds, of which 57% in overnights, 15% in households, 7% in apartments, 5% in mountain huts, 10% in heritage hotels, 4% in rooms for rent and 2% of uncategorized objects. There is a lack of facilities for higher category accommodation such as hotels with larger capacities. There is a noticeable increase in the

number of accommodation capacities in the Požega-Slavonia County. In 2018, the number of accommodation capacities increased by as much as 76% compared to 2016, and in 2018 the share of accommodation capacities of the Požega-Slavonia County in continental Croatia excluding the City of Zagreb was 5% and tends to increase.Below is an overview of the number of tourist arrivals and nights spent in the County of Požega-Slavonia in relation to the Republic of Croatia, or continental Croatia.

Table 3: Overview of tourist arrivals in Požega-Slavonia County

	2016.	2017.	2018.	2019.	Index 2019/16
Republic of Croatia	15 454 000	17 430 000	18 666 850	20 691 621	134
Continental Croatia	2 009 020	2 265 900	2 516 035	2 661 984	133
Continental Croatia excluding the City of Zagreb	900 000	979 900	1 115 834	1 203 786	134
Požega-Slavonia County	11 516	13 399	16 252	20 718	180

Source: (DZS, 2019)

Analyzing the data from Table 2, it can be seen that at the level of continental Croatia, the arrivals of the Požega-Slavonia County accounted for only 1.5%, but the increase in tourist arrivals is evident. In 2019, as compared to 2016, an increase of as much as 80% is evident. According to the results achieved, it can be concluded that this is a region, Golden Slavonia, which is only at the beginning of the valorisation of exceptional tourism potential.

Table 4: Overview of tourist nights spent Požega-Slavonia County

	2016.	2017.	2018.	2019.	Index 2019/16
Republic of Croatia	77 919 000	86 200 000	89 651 789	108 643 554	139
Continental Croatia	3 895 950	4 310 000	4 855 415	5 086 532	130
Continental Croatia excluding the City of Zagreb	1 923 950	2 046 000	2 343 598	2 432 377	126
Požega-Slavonia County	26 000	31 000	36 134	46 245	177

Source: (DZS, 2019)

In terms of overnight stays in 2019, the County of Požega-Slavonia recorded significant growth compared to 2016 by as much as 77%. The County of Požega-Slavonia accounts for a modest 1.5% of the total nights of continental Croatia without the City of Zagreb.
The average utilization rate of continental Croatia accommodation without the City of Zagreb is 20%. The utilization of accommodation capacities for Požega-Slavonia County in 2019 is 10%. The average stay of tourists in the continental tourist destination is 2.1 days and for Požega-Slavonia County is 2.3 days (CBS, 2019). These are certainly indicators that need to be significantly improved. It is for this reason that, aware of the exceptional natural, cultural and eco-gastronomic potentials for the development of quality and successful tourism, the public local administration and only the administration of the Požega-Slavonia County, with the support of the Tourist Boards, embarks on a quality management project called IQM

Destination Golden Slavonia, ie branding of Požega-Slavonia County into the Golden Slavonia tourist brand. The Integrated Quality Management System in the County of Požega-Slavonia aims to implement quality that encourages controlled progress in products and services in the destination, which will surely be reflected in the increased number of tourist arrivals and the number of tourist nights. With the implementation of this project, the goal is to establish the recognition and uniformity of quality of products and services in the area of the Golden Slavonia tourist destination. The results of the research of Phase 1 of the project will be presented below, and consequently what activities have been undertaken.

The first phase of the implementation of the IQM Destination Golden Slavonia project ran from November 2017 to February 2020. It was implemented in three sub-phases:

1.1. Phase presentation of the project and investigation of the current situation,

1.2. Phase processing of research results, presentation of research results with suggestions and measures for improvement

1.3. Implementation of the IQM Destination Golden Slavonia project and award of certificates

In the first phase of exploring the current situation, the so-called primary survey was answered by 100 respondents, representatives of the accommodation industry, representatives of tasting rooms, pubs, wineries, local producers, holders of attractions, wellness offers, restaurants and cafes.

The following are the results of the primary research regarding the views of business entities on tourism development in the Požega-Slavonia County, informing the local population and potential tourists about the tourist offer of the county, networking of tourist entities, education, and activities related to digital marketing of business entities. When asked what are the biggest challenges of tourism development in your destinations, the respondents pointed out their key challenges: growth and development of quality accommodation, lack of hotel accommodation and unsatisfactory accommodation. The analysis of the accommodation capacities of Table 1. also showed a lack of quality accommodation in the Požega-Slavonia County. In the second place, the lack of events and the lack of quality promotion were highlighted. The tourist functions of manifestations are manifested through the expansion of the tourist market of the destination (Piporas, 2005), the extension of the tourist's stay in the destination, and the construction of the image of the destination (Jago, Chalip, Brown, Mules, & Ali, 2002; Xing and Chalip, 2006), facilitating better promotion of the destination (Schulenkorf, 2010) and as an element of attraction and animation in the destination (Derret, 2002). The manifestations also valorize local culture, traditions and customs (Hong, 2010), provide entertainment and recreation for participants, social cohesion, cultural and social progress (Fredline and Faulkner, 2000; Derrett, 2000). Therefore, it is certain that the role of manifestations is extremely large due to the wide range of influences on the destination and its sustainability, ie competitiveness but also promotion.

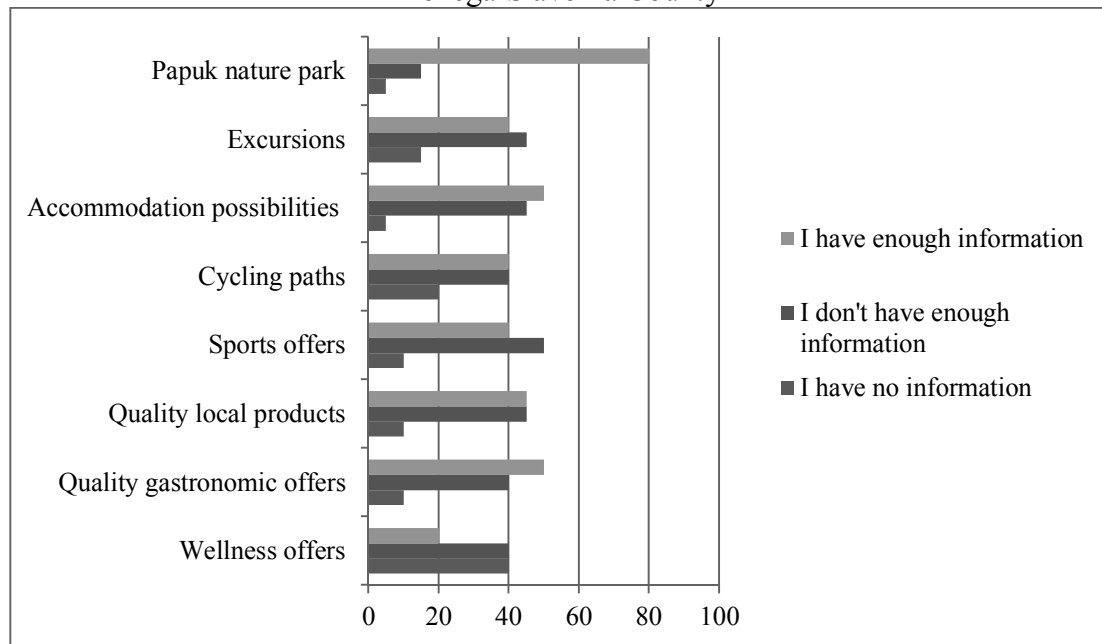
When the respondents where asked what was in their opinion the elements that tourists praise the most about the destination, they emphasized that they are natural beauty, eno-gastronomy, kindness of the host. According to the GRI (Global Reporting Initiative), the categories that have the most positive impact on GRI in the Požega-Slavonia County area are the same as the respondents' answers.

Picture 1: Categories that have the most positive impact on GRI in the Požega-Slavonia County

Based on the GRI (Global Reporting Initiative) data, we can conclude that the respondents have a good assessment as to what they are recognized as an attractive tourist destination and what tourists especially value in their destination. According to reviews posted by visitors on the Internet, a high level of quality of the services delivered was also achieved.

The results of the first part of the research indicate that it is necessary to adopt a Strategic Tourism Development Plan for the Požega-Slavonia County, ie Golden Slavonia, whose creation should involve all stakeholders. In the process of integrated tourism planning and crucial development decisions, maximum involvement of local interest groups should be ensured, emphasizing the positive effects that tourism brings to the local community, but also stimulating the active role of interest groups in protecting and enhancing all natural and built values of a certain space (Birkić et al.2014). The basic starting point in creating a vision for sustainable tourism development of a continental tourist destination should be the natural and cultural-historical originality of the destination based on the premise that it is not necessary to change, but to highlight the present advantages and authenticities that increase the competitiveness of the destination's offer (Birkić et al., 2019).

In the further research process, respondents were asked to rate the information of residents and visitors about the tourist offer in Požega-Slavonia County. Respondents were asked if they had sufficient information about the tourist offer in their destination, regarding wellness services, local gastronomy, quality of local products, sports offer, cycling trails, accommodation, excursions and visits to the Papuk nature park, and whether they had information on related offering a range of products in the area of Požega-Slavonia County.

Graph 1: Results of the Surveys on Informing the Respondents on the Tourist Offer in the Požega-Slavonia County


Source: authors

The results of the research show that the respondents are not well informed about other tourist facilities in the Požega-Slavonia County. Over 50% of respondents either lack information or have insufficient information about other tourist facilities. Only all respondents are very well informed about Papuk Nature Park.

Respondents also had to answer the question whether and how much they recommend to their guests other facilities in Požega-Slavonia County. The results of the survey are shown in Graph 2.

Graph 2: Results of the survey on the recommendation of certain tourist facilities in the Požega-Slavonia County
Source: authors

As we see, due to poor information, respondents rarely recommend other tourist facilities to visitors within the Požega-Slavonia County. An area that all respondents are well informed about is Papuk Nature Park and, in view of this, they regularly recommend it to their guests. Somewhat better in terms of recommendations are gastronomic amenities (restaurants and local products). From this we can conclude that the respondents are market-independent, perceived as competition, appearing individually. Due to limited financial resources and strong competition in the market, they are not recognizable and competitive. Previous tourism development in Požega-Slavonia County is largely left to individual entrepreneurial initiative and scarce sources of financing. As a result, a heterogeneous and fragmented tourist offer developed without significant recognition on the international tourist map. Given that rural tourism is dominated by small businesses with limited human resources in terms of staffing and knowledge, there is often a lack of a strategic approach to management at the economic entity level (Quaranta et al., 2016). Thus, Lane and Kastenholz (2015) consider that the biggest weakness of rural tourism today is the fragmentation into a large number of small under-cooperating entities, and that cooperation and networking with other local producers and service providers and stakeholders from other sectors can address the lack of resources. Namely, networking with other stakeholders in rural tourism opens up access to other resources, knowledge, market, technology, information and innovation. Collaboration brings numerous benefits, not only economic but also social through support, inspiration and trust among stakeholders. Therefore, tourist entities should have prepared, updated and updated information about the destination, with emphasis on the offer of other family farms, tasting rooms, picnics, wineries, etc., related offer that makes the range of various products in the area of Golden Slavonia destination. In this regard, it is necessary to organize at least once a year expert meetings on the topic of IQM Destination Golden Slavonia tourist offer and to create a brochure with updated information on tourist offer in the observed area.

Below, Graph 3 gives an overview of the status of the respondents in terms of training attended by the owners or employees participating in the IQM Destination Golden Slavonia project.

Graph 3: Participation of respondents in training related to their field of work

- I participate in training
- I don't participate in training
- It is in the plan
- It is not necessary
Source: authors

It is evident that only 10% of respondents attend some form of education, while as many as 60% of respondents do not attend any form of education. Standards of IQM Destination Golden Slavonia requires as a mandatory element once a year to participate in education that is intended for all holders of the certificate IQM Destination Golden Slavonia.

The results of this research, as well as the audit findings will be the basis for the development of standards and quality criteria for IQM Destination Golden Slavonia. The audit consisted of a tour of the facility, interviews with owners and employees. The following elements were analyzed: object design, interiors, music and scent animation, environment, business hours internet usage, staff, quality of service and products, online reputation, promotion and presentation of the object on the Internet through social networks and other platforms. Upon completion of the audit, each participant received a written report with comments and clear recommendations for future action so that they could become holders of the IQM Destination Golden Slavonia certificate.

Upon completion of Phase I of the implementation of IQM Destination Golden Slavonia, 100 participants of the project were awarded a certificate of Integrated Quality Management in the destination, which confirms the implementation of the Golden Slavonia standard and continuous investment in knowledge and encouragement for excellence.

By accepting the certificate, the project participants in the first phase of the project have committed themselves to the following, depending on the type of activity they perform or what products and services they offer. The joint obligations are: of all holders of the certificate IQM Destination Golden Slavonia:

- In a prominent place, featured #GoldSlavonia #visitGolden Slavonia
- Establish high quality of service and products (min. 80/100)
- Proactively promote local producers
- At least 50% of attraction products should have a destination theme
- Educated staff - attend at least once a year trainings related to IQM Destination Golden Slavonia
- Networking with a minimum of 10 partners in the destination
- Encourage visitors to rate the quality on the Internet
- Wi-Fi free.

Catering establishments that offer accommodation, food, drink and beverage services by accepting the IQM destination Golden Slavonia certificate have also committed themselves to the following requirements that they are required to implement in their business:

- Fragrant animation inspired by the natural scents of Slavonia plants.

The catering facility, if operating within the accommodation facility or independently in the offer, should have:

- Minimum 50% of the total supply of local origin (Slavonian products);
- Minimum 10% of local dishes from the area of Golden Slavonia (dishes with a story) - recommendation of the #GoldenSlavonia label
- Minimum of three vegetarian dishes and two gluten-free dishes
- Story product based on the tradition of Golden Slavonia
- Minimum of at least 5 types of Croatian wines available
- Minimum of 5 types of wine and 3 brandies available, minimum of 1 type of beer, minimum of 1 type of liqueur from the area of Golden Slavonia
- At least 5 types of wine and 3 brandies from the wider area of Slavonia
- Proactively recommend the local manufacturers we cooperate with
- Tell the story of the production method and the quality of the product
- At least 25% of Golden Slavonia's local products are included in the offer content

Facilities that offer SPA services and holders of IQM Destination Golden Slavonia are required to provide a minimum of 5 services that include the use of local essential oils and Golden Slavonia fragrances (treatments with a story).

5. Conclusion

In order to fully ensure the positive effects of tourism development and its maximum, it is necessary to provide a system of integral quality management of the continental tourist destination on the principles of sustainable tourism development. In this paper, a rural tourist destination in the area of Požega - Slavonia County that in the future wants to be branded as Golden Slavonia, is the main topic. It is a tourist region which has extremely rich natural, social resources, rich and recognizable eno-gastronomic offer, but in spite of this, it achieves extremely low tourist traffic in national contexts. This research identified the key shortcomings in the tourism development of the Golden Slavonia region. In the first place, this is the absence of the Tourism Development Strategy of the Golden Slavonia region, and secondly, it is a heterogeneous and fragmented tourist offer without significant recognition on the international tourist map. Given that rural tourism is dominated by small businesses with limited human resources in terms of staffing and knowledge, there is often no strategic approach to management at the level of the economic operator. The main disadvantage is that the tourist entities are independent of the market, perceived as competition and appear individually. Due to limited financial resources and strong competition in the market, they are not recognizable and are competitive. Previous tourism development in Požega-Slavonia County is largely left to individual entrepreneurial initiative and scarce sources of financing. Recognizing this, the public local self-government in cooperation with the regional, which is considered to be the most suitable for coordination in establishing the model of integrated quality management, begins the establishment of the project IQM Destination Golden Slavonia. The goal of the project is the establishment of an integrated quality management system, ie the systematic promotion and implementation of quality management in the destination. The focus of IQM Destination Golden Slavonia on the principles of sustainable tourism development is to define values at the local and regional level.

The IQM Destination Golden Slavonia project itself began with a study of the strengths and weaknesses of the Golden Slavonia tourist region and an analysis of the existing image of the destination. The ultimate goal of this project is to clearly define and implement the standards and quality criteria called Golden Slavonia. Systematically encouraging and implementing the requirements and standards of IQM Destination Golden Slavonia will also facilitate the adoption of the Strategic Plan for Tourism Development of the Golden Slavonia Tourist Region, as well as encourage the cooperation and networking of tourist entities operating in the region of Golden Slavonia. The emphasis is on innovation, creativity and connectedness, which in the project IQM Destination Golden Slavonia binds private and public partnerships in the destination and the environment, with all partners influencing quality in tourism. Cooperation with local, regional, national and international institutions is encouraged to share knowledge and experience with the ultimate goal of creating a successful and recognizable Golden Slavonia brand on the market. The goal of IQM Destination Golden Slavonia is to network partners and their services and tourism products in the destination. Establishing a public-private partnership emphasizes the importance of quality of service and   products   and   the competitive advantage of the destination. The basic determinants of quality management in the destination are sustainable development and responsible tourism. This paper presents one good example of how to approach recognizable brand building through integrated quality management entities.

GARCH ESTIMATION OF CEE FINANCIAL INTEGRATION AS COMPARED WITH GERMANY

ABSTRACT

Paper deals with procyclicality of stock exchanges regarding the economic activity of selected CEE countries, to measure the level of financial integration and to compare them with Germany as developed and leading EU economy. Empirical evidence of a relationship between stock exchange indices and main (macro) economic indicators have been analysed by using GARCH method. Research has shown that there are similar reactions of the CEE macroeconomic variables to different stock indices, also compared with Germany. However, there is no closer financial integration of CEE countries with Germany. Relation between financial market and real sphere in CEE countries reflects the one in the developed country, with some fundamental obstacles in CEE countries still to be overcome.

Key words: *stock markets, integration, European Union, ARCH.*

1. Introduction

The economic unions around the world were established during the last couple of decades. It is the reaction to the processes of globalization, fast flow of information, capital and labour. European Union (EU), North American Free Trade Association (NAFTA), Association of South-East Asian Nations (ASEAN) and many others strive to economic integration and cooperation. The main goal of regional associations is to strengthen the economic power to face global competition. The way to strengthen the economic power of member countries is to develop full economic integration and to bring benefits to all members of the association. This is especially true for the integration of transition (post-communist) countries into the EU. A transition country should carry out institutional reforms to catch up developed economies (Schönfelder and Wagner, 2016). The EU wants to create a better integrated, more competitive and innovative market place. Large market allowed achieving economies of scale. The competition led to better allocation and higher productivity of capital. It was also aimed at providing increased incentives for European producers to invest in product and process innovations, thereby improving the dynamic efficiency of the European economy.

For European consumers, the Internal Market was also seen as a source of benefits through wider choice and lower prices. International economic integration increased the competitive

pressures faced by European companies (Ilzkovitz et al., 2007). There are a lot of studies that investigate financial and economic integration. The underlying theoretical argument that links financial and economic growths is that financial markets allow achieving better allocation of capital. Financial markets require high effectiveness to satisfy investors. Better allocation of capital and higher effectiveness results in economic growth. There is no consensus whether the economic growth enhances the financial market or financial market enhances economic growth, but there are relations between real and financial sphere (Collins, 2007).

Many authors focus on interdependence of developed and developing markets in order to find out financial integration linkages. The main goal of this study is to estimate financial integration of Poland, Czech Republic, Slovak Republic and Hungary as a representative group of developing CEE countries and compare them with Germany, developed and strongest EU economy, by the impact of macroeconomic variables on the stock market indices during the period 2004-2018. Selected CEE countries are post-transition countries which in 2004 entered the EU. Therefore, paper analyses the impact of macroeconomic variables on stock market indices for the period since EU accession.

Poland, Hungary, Slovak and Czech Republic are part of the CEE region and also form informal regional cooperation so called Visegrad Group (V4). The Visegrad cooperation has a unique position in the Central and Eastern European region (Schmidt, 2017). Countries are connected not only by geographical neighbourhood and similar geopolitical conditions, but above all common history, tradition, culture and values. The idea of creating the Group was to intensify cooperation in the construction of democratic state structures and free market economy, and in the long run to participate in the process of European integration (Ciesielska-Klikowska, 2020).

The following chapters are structured thusly: In chapter 2 the theoretical background of the empirical analysis, macroeconomic environment and stock exchange markets in the observed countries are presented. An overview of existing empirical literature and different methodologies on the subject of assessing financial integration and testing the procyclicality of stock indices can be found in the chapter 3. The methodology and the data for the empirical analysis are explained in chapter 4, just like results and discussion; and the implications of the empirical analysis are revisited in the conclusion (chapter 5).

2. Theoretical background of empirical analysis: the macroeconomic environment and stock markets in CEE countries and Germany

Financial integration is positively associated with real per capita GDP, educational level, banking sector development, monetary growth, credit growth, stock market development, the legislation of the country and government integrity. GDP growth presumes a rise of the industrial production index and the rise of trade. Industrial production affects stock returns positively, primarily through increase of the expected cash flow (Aizenman and Noy, 2005).
The exchange rate as an important explanatory variable has a significant negative impact on stock exchange indices, followed by negative interest rates. A reduction in interest rates reduces the costs of borrowing, which have a positive effect on the future expected returns for the firm. Also, an increase in interest rates would make stock transactions more costly. Investors would require a higher rate of return before investing. This will reduce demand and lead to a price depreciation (Knif et al., 2008).
There is no consensus in theories and empirical evidence about the influence of inflation on stock exchange. The influence of inflation on stock exchange volatility could be negatively or positively correlated to the stock exchange. Fisher hypothesis about positive correlation between inflation and stock exchange volatility could be explained with the fact that the market rate of interest comprises the expected real rate of interest and expected inflation. This

hypothesis, when applied to stock markets, postulates a positive one-to-one relation between stock returns and inflation (Mohammad and Abdelhak, 2009).

The hypothesis how growth and improved macroeconomic stability lead to substantial private capital inflows, which can bring in additional volatility of stock indices is widely accepted in the literature. Generally, there is a positive relationship between the capital inflow and stock market indices (Sherazi and Ahmad, 2014; Syed et al., 2013).

Government debt significantly raises the borrowing cost of the domestic corporate sector, which discourages investment and reduces corporations' profits. Therefore, higher government debt causes higher lending interest rate, which may impact negatively on the development of the stock market (Aigheyisi and Edore, 2014).

There is a robust negative relationship between capital accumulation and unemployment, which has been reflected on capital market as a negative correlation. Also, higher stock market activity is associated with a lower unemployment rate, which also means that will have greater impact on stock volatility (Feldmann, 2011).

2.1. The macroeconomic environment and stock markets in selected CEE countries

Countries of the CEE region all went from being centrally planned economies to market economies, taking about twelve years to become member of the EU. These economies experienced very rapid development and liberalisation of their market while undergoing these changes (Baltzer et al, 2008). Some countries in the region went through less painful changes in their system, while others faced a lot of economic and social problems. Definitely, even the most developed countries of the CEE region were faced with challenges when trying to reach the standards of the most developed market economies. Poland, Hungary, Czech Republic, and Slovakia joined the EU in 2004. But Slovakia is the only one who introduced the euro currency (in 2009).

Governments and other state bodies of countries of the CEE region had put a lot of effort to meet all requirements to be able to join the EU. They have also followed all rules and started implementing demanding reforms after joining the EU. For former communist countries in Central and Eastern Europe, accession to the EU was part of their "back to Europe" endeavour. For all of those countries, the decision to join the EU was made with strong support of the citizens. The decision was preceded by referendums and more than half of participating voters voted in favour (Kažoka, 2014).

After 2000, most CEE countries recorded economic growth and GDP per capita grew quite rapidly with low inflation and progress in the field of market reforms. Due to lower domestic and foreign demand, CEE noticed deficits in current account at the beginning of 2000. But market reforms and economy restructuring resulted in lower deficit in current account in Poland and Czech Republic and surplus in Slovakia and Hungary. Still, the GDP per capita in countries of the Central and Eastern Europe region is lower when compared to the developed countries of Western Europe, but the gap is getting narrower (e.g. Poland has the lowest level of GDP per capita - 44% of average EU level in 2004). The average economic growth of CEE countries in the last decade was higher than in the EU because there was obviously open space for further development. It seems that all governments and central banks in the CEE region have been aware of the importance of stabilisation and low inflation for economic growth.

The Central European countries have become an important production centre on the EU market. They have become an attractive place to invest capital, especially for German small and medium-sized businesses. After they entered the EU their legislation was already close to German. Thanks to its relatively low wages and high productivity, Central Europe has become a factory for German products on the EU market. Germany is Central Europe's

most important economic partner, and in recent years this link has brought forth mutual economic benefts (Poplawski, 2016).

Grela et al. (2017) state that the CEE countries' growth and convergence will be in the future driven mainly by factors affecting structural competitiveness, especially innovation activity, institutional environment and policies targeted at diminishing the influence of demographic developments on the labour market outcomes. Khan (2020) points out that trade spillover effects of trade shock in the Central European Countries are strong and have a positive impact on economic growth which indicates their level of integration.

Relations of the V4 countries and Germany are essential for their economic development. Without a doubt Germany is the most important partner for all countries of the group, and vice versa. In addition to close political, cultural and social cooperation, these countries are linked by strong economic cooperation (Ciesielska-Klikowska, 2020).

The dramatic increase in stock prices in the CEE accession countries following the announcement of EU enlargement was a result of market integration and the subsequent re-pricing of systematic risk (Dvorák & Podpiera, 2006). At the end of 2012, stock market capitalization of CEE ranged between 5% (for Slovakia), 17% for Hungary and Czech Republic and 30% for Poland. These percentages are well below the euro area levels. For instance, at the end of 2012, despite the economic slowdown, the stock market capitalization for Germany was according to World Bank data approximately equal to 60% of its GDP, and 115% for the UK, and 115% for the US. The financial crisis had a great impact on CEE stock market because the indices did not recover and did not regain the pre-crisis levels.

Capital markets of the Visegrad Group are classifed as emerging markets. This is being expressed by the sophistication of the markets, the availability of financial products, and the capitalisation and liquidity of the respective markets. The total capitalisation of the stock exchanges in V4 equals to EUR 165billion, with Warsaw Stock Exchange (WSE) being three times larger than the remaining bourses of the Visegrad Group aggregated (Faldzinski et al., 2016).

Capital market liberalization has increased liquidity by almost 500 percent within the region over the past five years. Indeed, the Warsaw Stock Exchange has reached a market capitalization of 50 billion euros in just 13 years, reflecting the successful growth of the economy as a whole. The Visegrad region has made a remarkable success of aligning and strengthening financial services to meet the challenges of an enlarging European Union and to compete effectively with larger and more developed countries both regionally and internationally (International Visegrad Fund, 2020).

2.2. **German macroeconomic environment and stock market**

Germany is the largest national economy in Europe and is the third largest exporter in the world. Since the early 2000s, Germany faced current account surplus and its level is growing as a percentage of GDP. In 2002 it was 2% of GDP and 7% of GDP in 2007. When financial crisis emerged, the German government thought it would be confined to the USA only and would not affect Western Europe. Quite suddenly and unexpectedly, the German banks were strongly affected by the financial crisis (Kickert, 2013) and due to close affiliations between banks and industry, the crisis spilled over to real economy. Germany faced the recession in the second and third quarters of 2009, mostly due to rebounding manufacturing orders and exports - primarily from outside the Euro Zone - and relatively steady consumer demand. In 2009 the fall in the GDP growth rate was - (minus) 8%. In October 2008, the government set up a rescue fund for the banks. And in January 2009 the German government implemented a

€50 billion ($70 billion) economic stimulus plan to protect several sectors from a downturn and a subsequent rise in unemployment rates. Germany was hit hardly by the economic recession, but it recovered sooner and better than many countries.

The German economy profited from the apparently highly effective economic recovery package. In 2009, the German economy experienced a 5% decline, but the recovery began in September 2009. In 2010, the Germany economy showed a 2% growth and in 2011 a 3.2% growth was predicted. In 2009 GDP per capita was 36,000 USD and it was by 2,000 USD lower than year ago (this level was comparable with GDP per capita in 2005). After 2009 GDP per capita was growing quite significantly (almost by 1,000 USD per year). Germany faced the lowest level of unemployment rate of 7% in the 2009. Because of financial crisis the unemployment rate grew only slightly to 8%. It means that the employment in Germany did not decrease noticeably. Since then the unemployment rate is decreasing systematically and in 2016 is approximately 4%. Due to financial crisis in 2009, the amount of export decreased significantly by 30%, and it was no sooner than in 2012 that the export amount of 2008 was regained. Current account showed surplus during the whole financial crisis and in 2008 was 7% of GDP. For the next two years it was stable at the level of 6%, and since 2010 it is growing again - reaching the level of 9% in 2015.

Government debt as a percentage of GDP after 2007 grew rapidly, achieving the level of 80% in 2010. Then it started to decrease with some fluctuations and in 2015 was at the level of 72%. In the late 1990s and into the early 2000s, Germany was often called "the sick man of Europe". Today, after the Great Recession, Germany is described as an "economic superstar". In contrast to most of its European neighbours and the United States, Germany experienced almost no increase in unemployment during the Great Recession, despite a sharp decline in GDP in 2008 and 2009. Germany's exports reached an all-time record of $1.738 trillion in 2011, which is roughly equal to half of Germany's GDP, or 7.7 percent of world exports. Even the euro crisis seems not to have been able to stop Germany's strengthening economy and employment (Dustmann et al., 2014).

Recently, the country has been showing sound economic performance with steady growth. Being the largest in the European Union, the German economy is the fourth worldwide behind those of the US, China and Japan. The country was declared to be the largest exporter of goods in Europe and the third largest in the world. In terms of purchasing power parity, it is ranked fifth worldwide. However, what attracts so many international investors to trade German assets, such as stocks, bonds and indices, is the fact that Germany offers one of the most active and liquid markets in the world (FSE, 2020).

The DAX Index is the benchmark index for the German equity market. It tracks the performance of 30 selected German blue chip stocks traded on the Frankfurt Stock Exchange, which represent around 80 percent of the market capitalization listed in Germany. More than 50 percent of the total trades on the Frankfurt Stock Exchange are from investors located in countries outside of Germany. It had a market capitalisation of around $1.99 trillion as of March 2019, making it the world's 12th largest stock exchange (FSE, 2020).

3. Empirical literature overview and different methodologies of assessing financial integration

A number of studies have analysed how stock market integration affects stock market returns and investigated if stock market returns become more correlated in a more integrated market. The level of maturity of the domestic capital market is usually associated with the level of development of an economy. Various research studies indicate that an efficient capital market

is beneficiary to economic growth, macroeconomic performance, job creation and hence growth in living standards (Faldzinski et al., 2016).

Stoica and Diaconașu (2013) investigated linkages between several CEE emerging stock markets and Austrian, French, German, British and American stock markets. They used two econometric models which are estimated in framework of maximum likelihood, GARCH, and vector auto regression. Authors suggest that there exists some reaction from CEE markets to the arrival of price innovations from the developed markets, but the nature of these reactions and responses is mixed.

Dajcman et al. (2012) investigated stock market comovements between developed markets (Austria, France and Germany) and the developing stock markets (Slovenia, Czech Republic, and Hungary) by rolling wavelet correlation technique. Developed European stock markets were more interdependent in the observed period than the CEE stock markets. The latter group of countries exhibited a lower degree of comovements between themselves as well as with the developed European stock markets during all the observed time period.

Gjika and Horvath (2013) examined time-varying stock market comovements among three major Central European markets (the Czech Republic, Poland and Hungary) employing the asymmetric dynamic conditional correlation multivariate GARCH model. They found that asymmetric volatility is common in these stock markets and how correlations among stock markets in Central Europe and between Central Europe vis-à-vis the euro area are strong.

Chocholatá (2013) employed dynamic conditional correlation (DCC) models and found that the most rapid progress in the degree of stock market comovement between the CEE country and DAX was achieved for Hungary and Poland, followed only by the slight progress in case of the Czech Republic.

Peša et al. (2017) used panel ARDL method for estimation of stock market indices and macroeconomic environment of CEE countries. They found that export and import growth, followed by significant industrial production, were important for the GDP growth in all CEE countries. If this group of countries had not faced the global crisis of 2008/09, they might today resemble most developed EU countries.

Pražak and Stvarek (2017) investigate the nature of the causal relationships between macroeconomic factors and stock prices of selected financial sector companies listed on the Central European Exchanges by using the VECM model for the period from 2004 to 2017. Authors find out that GDP, inflation rate, interest rate, money supply and the unemployment rate affect stock prices, although the results did not provide a universal conclusion for all countries in the Visegrad Group.

Thai-Hung (2019) analysed the correlation of volatility between indexes of a CEE emerging countries (Hungary, Poland and Czech Republic) equity markets through the study of the dynamic conditional correlation based on five-dimensional GARCH-BEKK model for the period from 2007 to 2018. Author find out that correlations between observed markets are particularly significant as a result of strong economic integration for the period 2007-2018.

For the overall post-crisis period (2010-2016), the positive statistically significant linkages were detected among all V4 official stock market indices, indicating the similar stock market behaviour of geographically connected economics (Vychytilova, 2018). Differences in the V4 countries' economic performances are being narrowed (Ivanová and Masárová, 2018).

4. Methodology, data, results and discussion

4.1. Data specification

We constructed a data set of explanatory variables that are usually included in models: capital inflow (in billions of domestic currency, in real terms); the exchange rate (express as the price of one unit of foreign currency in units of domestic currency); the real GDP (in billions of domestic currency deflated by GDP deflator); government debt (expressed as percentage of GDP); short-run (6 months) interest rates (p.a.); trade balance (in billions of domestic currency deflated by GDP deflator) and unemployment rate (expressed as a percentage of the total labour force). We relied on the Eurostat database and on the databases of the national statistical bureaus of individual countries.

All the nominal variables expressed in national currencies were corrected by an individual country's appropriate deflator(s) (using the December of 2018 as the base) and converted into EUR by using the exchange rate of December 2018.

A monthly time series was used for the period from January 2004 to December of 2018, in selected CEE countries, Germany and US. The local stock price indices (closing prices) were used for each of the examined stock markets: PX (Czech Republic), BUX (Hungary), WG20 (Poland), SAX (Slovak Republic), DAX (Germany) and S&P500 (United States of America). Stock indices data (closing) were collected on national stock exchanges and adapted to monthly average indices from January 2004 to December 2018.

4.2. Methodology

In different estimations for the empirical evidence of a relationship between stock exchange indices and main (macro) economic indicators, we used the Autoregressive Conditional Heteroskedasticity (ARCH) methodology. Many studies used ARCH models for analysing behaviour of financial time series due to its ability of capturing the non - linearity and volatility clustering in stock data (Al-Zararee and Ananzeh, 2014). First, Engle (1982) introduced ARCH model appropriate for the stock markets characterized by time-varying volatility while Bollersev (1986) additionally proposed GARCH model in which the explanation of conditional variance can be captured parsimoniously. It has been used as a variance equation to be estimated simultaneously with the normal regression model in the mean equation. This method eliminates conditional heteroskedastic problems and makes the results in the mean equation more valid.

Therefore, GARCH method is very useful in examining the simultaneous variations among stock market returns and macroeconomic factors (Hussain et al., 2015), while significant coefficient of the lagged square error term (LSET) confirms validity of the model (Al-Raimony and El-Nader, 2012; Amit and Nitesh, 2014; Hsing and Hsieh, 2012). Before applying GARCH method, we eliminated the overly correlated explanatory variables for every country. There are two primary methods to examine the degree of co-integration among indices: the Engle-Granger methodology (1987) which is bivariate (testing for co-integration between pairs of indices) and the Johansen-Juselius technique. All variables were seasonally adjusted (Eviews 7, Stata 10) on the basis of monthly data from 2004 to 2018 for individual regressions. We used the Augmented Dickey-Fuller (1979) test to test a series for the presence of a unit root. According to the test results given in Table 1, all variables are stationary in the form dlog (x) i.e. integrated of order 1. To determine the lag length, we used Schwarz Information Criterion, because the Schwarz criterion and its parsimonious model perform better over a longer period of research (Ashgar and Abid 2007). A maximum of twelve lags was considered for each variable when determining the lag length.

Table 1: The Stationarity (Augmented Dickey-Fuller) - Poland, Czech Republic, Slovak Republic, Hungary, Germany, the US

5. Results and discussion

In Table 2 we found evidence for the strong impact of all variables on the pricing of stock exchange indices in each country. The variables are in most cases statistically significant, but the direction of impact needs sometimes to be more thoroughly examined. The impact of capital inflow on stock market might be explained by the theory (Sherazi and Ahmad, 2014; Syed et al., 2013) that assumes positive impact on stock exchange indices. The more capital inflows to the country, the more money might be invested in the companies by buying shares or bonds. And this is confirmed for all observed countries. High positive coefficient correlation for Hungary, Poland and Czech Republic confirms that those markets are strongly dependent on capital flows. Farnad et al. (2019) conclude that the effect of financial integration on financial development significantly changes according to the different financial inflows which have strong impact. Peša et al. (2017) found positive impact of capital inflows and industrial production in the CEE group of countries. Integration is positively correlated with real per capita GDP, monetary growth, credit growth, stock market development, and that the radical rise in stock prices in the CEE transitional countries is solid evidence of a good environment for economic development in the region.

For all CEE countries and Germany there is positive correlation between exchange rate and the pricing of stock exchange indices. We expected to find negative correlation, because the theory assumes that any depreciation of the currency should bring positive economic activity and the rising trends of stock exchange indices (Knif et al., 2008). Our findings might be explained as follows: a rising/stable stock market is an indicator of an expanding/mature economy, and the demand for the currency rises and it appreciates and vice versa: decreasing stock market is a sign of declining economy and the currency depreciates. Poland moved gradually from a rigid fixed exchange rate targeting regime to a more flexible system with wide bands over time. This process is obvious in our results (see table 2). Exchange rate volatility depends on the exchange rate regimes so volatility is more harmful when countries adopt flexible exchange rate regimes (Barguelli et al., 2018).

Only Poland and Slovakia have shown strong negative impact of government debt, which is consistent with the theory (Al Kharusi and Stella, 2018). When the government issued new bonds, people withdrew money from stock market to buy government bonds. It seems that

citizens in these two countries react strongly to new issues of government bonds. In other countries the research did not allow to draw any statistically significant results regarding government debt.

Industrial production index is positively correlated in Czech Republic, Slovakia, Hungary and Germany, but did not show strong correlation in Poland. The theory assumes that the higher industrial production index, the more optimistic the businessmen and investors are (Aizenman and Noy, 2005). And the more optimistic they are, the more they invest in the development of companies and they are also more prone to raise new capital.

Interest rates have been recently an important tool of monetary policy focussed on supporting economic environment. The theory assumes that the lower interest rate, the cheaper capital is and the more prone the companies are to invest (Knif et al., 2008). We found negative correlation in all analysed countries (CEE and Germany), which is consistent with our expectations and theory. Also, Saglam and Guresci (2018) found co-integration between interest rates and stock prices of Poland, Hungary, Slovak Republic and Czech Republic, so they conclude that monetary policy decisions have an impact on investors' behaviours in the observed CEE countries.

Interest rate of Hungary is even more significant. The market rate in Hungary, as well as the central bank base rate, changed by relatively large steps in the recent years. This fact motivated the banks to adjust their rates more quickly than in other countries, enjoying a more stable financial environment.

As for unemployment in all analysed countries, there is a negative correlation. And again, this relation is consistent with the theory (Feldmann, 2010) and our expectations. The theory assumes that the lower unemployment rate, the more optimistic the companies and individuals are. The more optimistic they are, the more willing they are to invest (both companies and individuals). Our results show rather high coefficient of unemployment rate in Slovakia. The average rate of Slovak unemployment in the last 20 years reaches 14.5%, well above the majority of European countries. Main findings suggest that there are three predominant causes of the unemployment presented in the order of their importance. First, very low skills and discrimination exclude Roma population from the labour market. Second, inadequate initial structure of the economy continues to hamper employment growth from the onset of the transition process. Third, high contributions and inappropriate tax-benefit system reduces job creation among low-income households (Machlica et al, 2014).

The identified relations between macroeconomic indicators and the pricing of the stock exchange indices might be explained by relevant theory for analysed countries. Still some specific economic situation distorts juxtaposed theoretical explanation in some countries. German stock exchange presents strong correlation with capital flows, exchange rate, industrial production index, interest rate and unemployment. Our results prove the same behaviour pattern of the CEE countries as developed economies, which might be result of the long period of analysis - 2004-2018. The 15 analysed years covers 180 monthly observations, which is quite a long time to find out the stable relation free of impact of any economical distortion (financial crisis, slowdown, and inflation).

All analysed CEE countries seem to follow the German pattern (but with higher or lower correlation coefficient). It should be pointed out that Ciesielska-Klikowska (2020) find out that there is a strong economic integration of Visegrad countries with the Germany while their dependency is mutual.

However, correlation analysis of stock market indices shows that Poland is the only stock market from CEE group that is strongly correlated with the German - (0.8) for the whole 2004-2018 period, while Hungary shows moderate correlation (0.3), Czech Republic no correlation at all (0.01), and Slovak Republic negative correlation (-0.25).

Anyway, the results are suitable for the period of CEE countries being a member of EU. The CEE countries made a great deal of progress in transforming and restructuring their economies. Glodowska i Pera (2019) state that economic integration of the CEE countries to the EU has had a positive and dynamic impact on their catching up process since 2004.

Observed countries react in the same way as Germany, but there are still a lot of problems to be solved: high and growing government debt, high unemployment rate, uncompetitive industries, low GDP per capital, low standard of living, outflow of skilled workers to Western Europe. There are still a lot to do to increase macroeconomic and financial stability, pace and depth of structural reforms, to strengthen the business environment.

Table 2: GARCH method coefficients by individual country

Dependent variable: dlog(y) (01m 2004 to 12m 2018)

Coefficients both the lagged squared residuals (α) and lagged conditional variance (β) in the Variance equation are significant (probability less than 5%). Past volatility in cases of Germany ($\beta > \alpha$) means that the stock markets were more affected by past volatility than economic news while for the other CEE countries volatility clustering exists in the present moment.

6. Conclusion

We aimed at investigating the financial integration with reference to macroeconomics situation of the economies of CEE countries against Germany, developed county, in period of 2004-2018. We expected to find closer correlation, especially since CEE countries fulfil all necessary requirements and they became members of EU since the early 2000, and they are considered to be more developed than they were at the beginning of the 1990s. CEE stock market indices showed weak or no relation with German stock market (except for Poland) in the long term. Despite weak relations between stock markets from different countries, we found that analysed stock markets react in similar way and with similar strength to the main macroeconomic indicators. This might prove that the relation between financial market and real sphere in CEE countries reflects the one in the developed countries, with some fundamental obstacles in CEE countries still to be overcome. Movements of the stock market indices are the results of the movements in the economy.

POSSIBILITIES AND LIMITATIONS OF IMPROVING FACTORING IN BOSNIA AND HERZEGOVINA: LEGAL AND ECONOMIC ASPECTS

ABSTRACT

The challenges of financing and lending in contemporary business conditions are sought to be overcome by the introduction of specific methods, techniques and contractual instruments. One of those methods is factoring. The factoring system in Bosnia and Herzegovina at the end of the third quarter of 2019 consisted of one registered factoring company and four commercial banks. Furthermore, the total value of concluded factoring contracts has increased by 51 percent compared to the previous year. This basically means that factoring in Bosnia and Herzegovina is at its infancy but has the potential of driving significant benefits to the business community and improving the business environment. On the other hand, half (50 percent) of Bosnian-Herzegovinian companies state that they would be able to hire more employees if their debtors were faster with the payments. Additionally, they would be able to mitigate late payment consequences such as penalty interest costs, income loss, liquidity squeeze, a threat to survival, employee layoffs, fewer new job openings, etc. Considering the previous, the aim purpose of this paper is to investigate the possibilities and limitations of improving factoring in Bosnia and Herzegovina as a progressive financial product that affects cash flow, improves liquidity and accelerates working capital. By using the comparative method and analysis method we have concluded there is a significant room for the affirmation of factoring. Key areas of future improvements: legislation, factoring promotion and factoring fees.

Key words: *small/medium-sized enterprises (SMEs), factoring, banks, accounts receivable, Bosnia and Herzegovina (B&H).*

1. Introduction

From an economic perspective, factoring represents a specific corporate funding instrument. To be more precise, factoring is a claims recovery mechanism allowing for increased liquidity of a business enterprise. Considering that factoring is a funding instrument, from the perspective of banking operations it is classified as a special credit operation. On the other hand, from the legal perspective factoring is a subject matter of a factoring contract in which one contractual

side (factor) commits to take over short-term receivables from the other contractual side (client), recover these receivables, in its own name and on its own behalf, and then reimburse the counter value to the client within a specified time period and guarantee the payment under certain conditions, while client commits to pay an appropriate fee to the factor.

In the case of severe illiquidity and long maturity, factoring can significantly contribute to successful corporate operations. Insight into the average contractual and realized the date of payment by sector in Bosnia and Herzegovina reveals late payments indicating the need for an improved receivables collection. However, the scope of factoring operations in Bosnia and Herzegovina suggests that the potential is not recognized. Additionally, if we compare the scope of factoring operations in Bosnia and Herzegovina with other countries it is further evident that factoring is not recognized as a funding instrument and liquidity improvement mechanism. Inspired by this, we explore legal and economic opportunities of improving factoring operations in Bosnia and Herzegovina. Research results regarding the impact of factoring operations on corporate liquidity in Bosnia and Herzegovina suggest that companies see quick access to funding as the main advantage of factoring while the main drawback is the high cost of factoring services (Kozarević, Hodžić, 2016, p. 28). In contrast to the other types of financial borrowing which lead to an increase in liabilities side, factoring allows assets-based financing (part of the assets related to the accounts receivables). Thus, indebtedness is not increased, creditworthiness is maintained as well as liquidity, especially in the segment of small and medium enterprises. However, regardless of this, insufficient market recognition of the factoring as a corporate funding source results in the untapped potential offered by factoring operations (Ristić, Rička, 2015, p. 74). The low growth rate of economic activity is contributing to the negative development trend of factoring industry in Bosnia and Herzegovina, as well as the level of local and foreign investments, but also the quality of legal certainty in establishing the protection of factoring operations users (Salihović, 2010, p. 266). Researchers exploring the liquidity management by establishing factoring market in Bosnia and Herzegovina conclude that companies should focus their attention to factoring as a mean of solving a chronic illiquidity issue (Rička, Alihodžić, 2016, p. 307). Finally, international claims recovery represents a significant challenge to the business world given different legal frameworks. Local exporters often agree to unfavorable payment conditions in order to retain international clients, potentially jeopardizing a business. Oftentimes, company headquarters are located in one country, owners in another, while management is positioned in a third country. Furthermore, foreign language, different legal framework as well as mentality can make claims recovery much more difficult. Factoring companies offering payment mediation, payment guarantee services as well as factoring services have the potential to resolve challenges related to international payment recoveries too.

2. Legal sources chronology of factoring operations regulation

The synergy of legal and economic elements within factoring operations leads to impeded access to providing adequate regulatory answers related to the application of existing national rules for classic contracts (sales, cessions, credits, consignment, etc.) In a modern sense, factoring is an institute of American provenance (Martinek, 1991, p. 229). Although it originated and was developed within the American trade practice of agency and consignment operations, it was successful in paving its way to Europe during the early 60ties regardless of many obstacles related to different economic and legal frameworks (Kronke, Melis, Schnyde, 2005, p. 745). Besides national legal interventions, certain discussions and international activities were held under the International Institute for the Unification of Private Law (UNIDROIT) based in Rome, with the goal of mitigating observed difficulties related to cross-

border relations between factoring parties headquartered in different countries. As a result, the Convention on International Factoring (CIF) was adopted in 1988. at Ottawa (Canada). On the other side, countries that were part of the so-called „socialist legal and economic value system" by the late 90ties there was no corresponding legal infrastructure or the awareness regarding the importance of factoring operations for the development of the national economy. As such, factoring operations were only sporadic in former Yugoslavia, although there were technical discussions (for example, expert consulting held in Opatija in 1971.) as well as establishing the legal framework for such operations (Spasić, 1995, pp. 72-74). However, since such a legal framework never came to be, factoring existed as a standalone contract of autonomous trade law in relation to the above-mentioned contracts on sales, cession, and credits.

The lack of regulation within the Law of Obligations meant that factoring is legally treated partly by foreign trade regulations, but also customs, foreign exchange, and tax regulations. Therefore, factoring providers were free to develop their own practice based on existing forms. The state of autonomous regulation lasted until the dissolution of Yugoslavia and the emergence of independent states when the need for a separate legal regulation became clear. The Republic of Serbia was the first to pass the Law on factoring in 2013. The Republic of Croatia passed the Law on factoring in 2014 and amended it in 2015 and 2016. Likewise, the Republic of Montenegro passed the Law on financial leasing, factoring, purchase of receivables, microfinancing, and credit and guarantee operations in 2017. In Bosnia and Herzegovina, the Law on factoring was passed in 2016 but only in the Federation of Bosnia and Herzegovina while in the Republic of Srpske there is still no lex specialis governing this area although in late 2019 there were public discussions on the draft of the law. Hence, factoring operations in Bosnia and Herzegovina are legally regulated in the Federation of Bosnia and Herzegovina. Factoring users in Federation are legally obligated to follow these rules, while the other entity still – the Republic of Srpska, no legal framework exists at the moment.

According to the Law on factoring, factoring operations in Federation of Bosnia and Herzegovina can be carried out by a limited liability company or joint-stock company with the location in Federation of Bosnia and Herzegovina approved by the Banking Agency of the Federation of Bosnia and Herzegovina but also a bank whose business is a subject to banking regulations in Federation of Bosnia and Herzegovina. In the accordance with jurisdiction regarding oversight stipulated by the Law on Banking Agency of the Federation of Bosnia and Herzegovina, the Banking Agency supervises factoring companies operations to verify legality, evaluate security and stability of factoring companies in accordance with the Law on factoring, to protect clients interest as well as public interest, but also contribute to the overall financial stability, and guard the trust in the factoring market. When it comes to the minimum founding capital for factoring operations in Bosnia and Herzegovina, it is above the Croatia and Serbia threshold, and equals to 750,000 BAM, approximately 385,000 EUR.

The minimum initial capital for factoring operations in the Republic of Croatia is 1,000,000 HRK, approximately 135,000 EUR, while in the Republic of Serbia the minimum founding capital is 340,000 EUR. Due to lack of legal regulation of factoring the following discussion will be limited to the scope and application of classic contractual law (sales contracts, cession, credit, etc) in the Republic of Srpska.

Law on factoring in the Federation of Bosnia and Herzegovina defines factoring as the legal act of selling non-matured claims or future short-term cash receivables arising from contractual sales for products or services in the country or internationally, contractually transferred to the factor who is taking over claims to collect receivables in his own name and on its own behalf.

Three sides to factoring (purchaser or factor, vendor or client, and client's obligor) will benefit if a factoring contract is realized successfully. The role of factor belongs usually to banking institutions or specialized institutions whose main or supporting economic activity is factoring. On the other hand, clients entering the factoring contract with a factor are usually private sector subjects (small and medium enterprises) trying to secure uninterrupted cash flow and product placement without additional debt. In contrast, the fee that a factor charges represents a factoring contract cause that establishes a factor's economic interest and can be determined differently depending on the functions performed: taking over unclaimed receivables, lending, *del credere* guarantee, etc. (Brkić, 2011, p. 180). The structure and the value of fees will necessarily depend on the level of costs for services provided by a factor to a client, but also the interest charges for lending the client, as well as the degree of risk regarding the collectibility of such receivables.

Based on factoring contract the client has the obligation to delivery periodically (for example, weekly) receivable invoices to the factor with cession clause included, while the factor takes over the obligation to collect receivables after they are due as well as other activities related to the collection (for example, to request payments, send reminder letters, initiate litigation, etc).

3. Current state and perspectives of factoring operations – international overview vs Bosnia and Herzegovina

According to the latest reports and data published for 2018 (World Factoring Statistics, p. 4) statistics indicate the worldwide growth of factoring operations of 6.5% compared to 2017. The volume of factoring for 2018 is 2,767,067 trillion EUR. Curiously, the volume of factoring operations from 2012. to 2018. grew each year from 2,132,186 trillion EUR in 2012 to 2,767,067 trillion EUR in 2018. Differentiated by continents, the largest increase was made in Europe. Factoring and commercial financing within the European Union grew by 8% in 2018, starting from 1,7 trillion EUR. The following two figures present the monetary value and annual turnover growth for factoring operations in the EU.

Figure 1: Factoring turnover in European Union (2013-2018)
Source: EU Federation for Factoring and Commercial Finance, Newsletter, Annual Review, May 2019, Issue 17, p. 5.

Figure 2: Annual factoring turnover growth in European Union (2013-2018)
Source: EU Federation for Factoring and Commercial Finance, Newsletter, May 2019, Issue 17, p. 5.

Data on factoring operations turnover in Bosnia and Herzegovina are not available, but among neighboring countries, Croatia and Serbia are listed. Between 2012 and 2019, the largest increase of the factoring operations volume in Croatia was in 2013 amounting to 3,136 billion EUR according to the IFC data. After 2013, the volume is decreasing year over year resulting in an 18% drop in 2018 compared to the previous year, which translates to 246 million EUR in absolute terms.

Table 1: The volume of factoring operations turnover for the past 7 years in Croatia (in mil. EUR)

Year	2012	2013	2014	2015	2016	2017	2018	Decrease 18/17
Croatia	2,269	3,136	2,498	2,885	2,285	1,340	1,094	-18%

Source: World Factoring Statistics: https://fci.nl/about-factoring/2018_World_Factoring_Statistics.pdf (accessed 20 February 2020)

The volume of factoring operations for the same period in Serbia is much more modest. However, in contrast to Croatia, the trend is increasing. Table 2 gives an overview of factoring operations turnover volume for the past 7 years.

Table 2: The volume of factoring operations turnover for the past 7 years in Croatia (in mil. EUR)

Year	2012	2013	2014	2015	2016	2017	2018	Increase 18/17
Serbia	950	679	306	445	555	603	650	8%

Source: World Factoring Statistics: https://fci.nl/about-factoring/2018_World_Factoring_Statistics.pdf (accessed 20 February 2020)

Given that the Law on factoring in the Federation of Bosnia and Herzegovina was passed in 2016, the volume, structure, and trends in factoring operations were analyzed for the period that followed. The table provided below shows that after the Law on factoring was passed only one

subject was registered for factoring operations in the Federation. The subject continued its operations during 2018 and 2019 but was closed by the end of 2019. The initial capital of the company was below the regulatory minimum (750,000 BAM or 383,469 EUR), the turnover was minimal, and the company was making losses.

Table 3: Quantitative data on factoring operations in the Federation of Bosnia and Herzegovina after the Law on factoring (EUR)

Year	31.12. 2017	31.12.2018	31.12.2019
Number of companies	1	1	1
The minimal regulatory capital	383,469	celow minimum	operations closed
Number of factoring contracts	0	2	-
Assets side	-	562,421	-
Factoring short-term receivables	-	357,904	-
Cash and cash equivalents	-	153,388	-
Tangibles and intangibles	-	51,129	-
Liabilities side	-	562,421	-
Tier 1 equity	-	562,421	-
Loss	-	204,517	-
Total Liabilities	-	204,517	-
Short-term liabilities	-	153,388	-
Total revenues	-	4,602	-
Total expenses	-	209,118	-

Source: Autor's calculatiom: https://www.fba.ba (accessed 22 February 2020)

Given that the company was registered late in 2017 it had no factoring operations the same year so the overall volume of factoring operations in 2017 was entirely realized by banks (approximately 179,119,862 EUR). The majority of realized factoring operations (approximately 88.6%) were factoring operations with recourse as a less risky option for banks. That is not surprising given that approximately 77% of factoring operations volume refers to the international factoring operations that are more risky by default. Thus, through factoring contracts in 2017 banks have acquired international receivables amounting to 136,870,280 EUR and contributed to improved liquidity.

Table 4: Ratio of purchased receivables between banks and factoring companies in the factoring system of the Federation of Bosnia and Herzegovina in 000 EUR (2018 vs. 2017)

Factoring type	Factoring companies				Banks			
	2017		2018		2017		2018	
	Amount	%	Amount	%	Amount	%	Amount	%
With recourse	-	-	344	100%	158,747	88.6%	28,555	42.8%

The volume of factoring operations in banks was significantly decreased in 2018 compared to the year 2017 from 179,074,000 EUR (2017) to 66,718,000 EUR (2018). Furthermore, the

structure of factoring operations was changed as well given that international factoring operations were not realized while having a significant share in the previous year. That being said, the ratio of factoring operations with recourse and without recourse has been reversed compared to the previous period since factoring operations without recourse now dominate (approximately 57%) increasing the risk for a factor.

Table 5: Index and share of purchased receivables at the level of factoring system of the Federation of Bosnia and Herzegovina in 000 EUR (2018 vs 2017)

At the level of factoring system of the Federation of Bosnia and Herzegovina, comprising of a single factoring company and four commercial banks, 99.5% of total factoring volume operations made in 2018 refers to banks while 0.5% refers to the factoring company. The total volume of factoring operations in 2018 as compared to 2017 was decreased by 63%.

Table 6: Ratio of purchased receivables between banks and factoring companies in the factoring system of the Federation of Bosnia and Herzegovina in 000 EUR (1.1.- 30.09.2018 vs. 1.1.- 30.09.2019)

Looking at the first three quarters of 2019 compared to the first three quarters of 2018 we observe the increase in the volume of factoring operations realized by banks by more than 50%. A single registered factoring company made its first operations during the last quarter of 2018 and first three quarters of 2019 but made only 0.5% of total factoring operations volume with a decreasing trend of factoring operations absolute value. When it comes to the structure of factoring operations engaged by the factoring company, only local factoring has been treated, having factoring with recourse contracts during the first year, and without recourse (more risky) during the second year.

Table 7: Index and share of purchased receivables at the level of factoring system of the Federation of Bosnia and Herzegovina in 000 EUR (1.1.- 30.09.2018 vs. 1.1.- 30.09.2019)

Besides performing factoring operations with or without recourse in a local factoring market, which was a dominant factoring type in 2018, an additional type of factoring operation was introduced in 2019, so-called reverse factoring, after a single bank realized factoring contract of this type. In 2018 and 2019 factoring providers were not engaged in purchases of receivables related to international factoring, or operations comparable to factoring (the assessment of the financial soundness and creditworthiness of legal entities or self-employed individuals, insurance claims, discounting bills, issuing guarantees, sales of tangibles or intangibles taken as collateral based on factoring operations, etc.)

Looking at the number of factoring contracts after the Law on factoring was passed we observe the decreasing trend. However, the volume of contracts is increasing so the total volume of factoring operations is increased by 50% during the first three quarters of 2019 as compared with the same period of 2018.

Table 8: Number of factoring contracts in the Federation of Bosnia and Herzegovina (2017-2019)

Year	2017	2018	2019
Number of factoring contracts	353	287	244

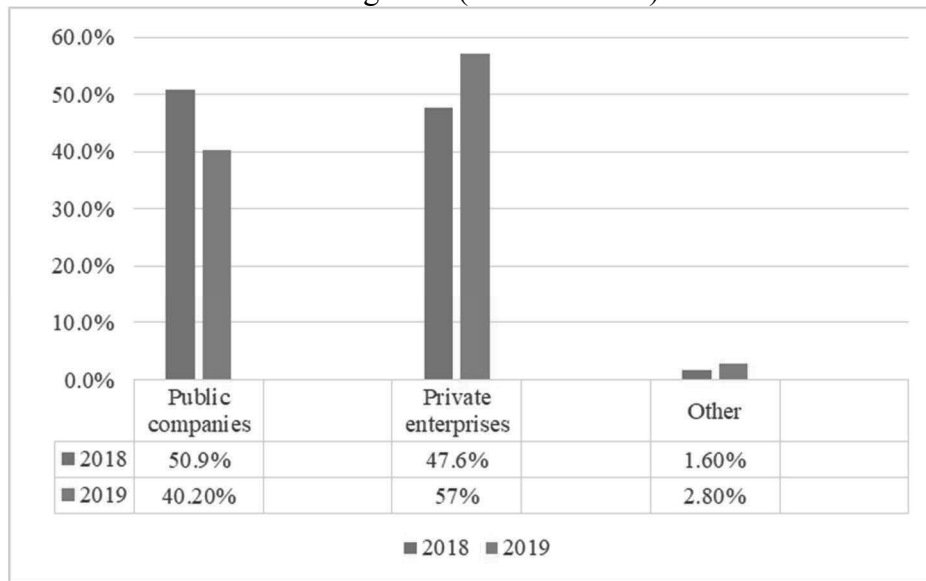
	Public companies	Private enterprises	Other
■ 2018	50.9%	47.6%	1.60%
■ 2019	40.20%	57%	2.80%

■ 2018 ■ 2019


Source: Autor's calculatiom: https://www.fba.ba (accessed 22 February 2020)

Factoring operations in the Federation of Bosnia and Herzegovina within the factoring system comprised of 4 banks and 1 factoring company were performed exclusively through the financing function. No payment guarantee services, receivables management, or operations comparable to factoring were observed, thus confirming that factoring is still in its infancy in the Federation of Bosnia and Herzegovina. The need for short-term financing and cash receivables management, as well as payment guarantees, are cornerstones for considering factoring as one of the most dependable tools for solving liquidity problems.

4. Receivables performances in Bosnia and Herzegovina: potential for improving factoring operations

For the analysis of assets management efficiency - the receivables turnover ratio proves substantial. Companies aim to have this ratio as low as possible, indicating a quicker transformation of receivables into cash. Having insight into the average contractual payment deadlines and average actual payments in Bosnia and Herzegovina by sector (public sector, business sector, consumer sector) we observe late payments averaging between 6 and 12 days in 2019, 8 do 17 days in 2018, and 6 do 9 days in 2017. In 2018 and 2019 late payments were largest on average in the public sector. Comparing with the European Union where the late payments average was between 2 and 9 days it is quite clear that the assets management efficiency is below EU standards. Furthermore, compared with Serbia in 2019 where the range of late payments was up to 5 days on average or Croatia where late payments averaged 7 to 11 days, we can conclude that the late payments average in Bosnia and Herzegovina in 2019 was longer than the EU average, longer compared to Serbia's average, but comparable to Croatia's average.

Table 9: Average contractual vs realized payment time by sectors in Bosnia and Herzegovina and region in days (2017-2019)

Region	Year	Public sector		Business sector		Consumer sector	
		Average contractual payment time	Average payment	Average contractual payment time	Average payment	Average contractual payment time	Average payment
Bosnia and Herzegovina	2017	43	41	40	46	33	42
	2018	50	67	56	70	39	47
	2019	34	46	33	39	16	27
Croatia	2017	35	47	30	44	34	37
	2018	38	44	32	43	22	28
	2019	31	38	31	41	20	31
Serbia	2017	37	41	35	39	40	38
	2018	41	40	33	34	40	33
	2019	36	38	38	43	53	47
Average EU	2017	33	41	32	37	24	24
	2018	34	40	32	34	23	22
	2019	33	42	34	40	21	23

Source: European Payment Report, 2019, p. 26.

Factoring allows optimization of receivables collectibility. Since the receivables collection period suggests a problem in Bosnia and Herzegovina, it should be noted that there is a justified need for funding instruments such as factoring. However, it is quite evident that this need is not met given the scope of factoring operations in Bosnia and Herzegovina. Furthermore, the overview of factoring operations in Croatia shows the decrease of factoring operations scope revealing the negative correlation with increasing late payments time trends. The opposite is true for Serbia given that the scope of factoring operations (albeit modest) shows the increase of volume, with the late payments days decreasing.

Trying to uncover potential sources of late payments, Europan Payment Report 2019 suggests that companies usually cite financial difficulties as the dominant cause, which is also the dominant cause of late payments for the EU region. Furthermore, negative consequences of late payments for companies in Bosnia and Herzegovina are primarily reflected in: (1) revenues decrease, (2) additional interest charges for the missing funds, (3) decelerating growth, (4) decreasing number of employees, and (5) incapacity to hire additional employees. Finally, most of the surveyed companies in Bosnia and Herzegovina believes that the advancements in the segment of receivables collection would help them increase employment compared to the previous year.

5. Conclusions and recommendations

By identifying the quality and performances of the average receivables in Bosnia and Herzegovina we can conclude that there is a significant room for the affirmation of factoring. The average number of late payment days was between 6 and 12 days in 2019, markedly above the average number of late payment days for the EU.

However, insight into trends and the structure of factoring operations reveals that the potential for improving the liquidity of companies in Bosnia and Herzegovina is not being realized through factoring arrangement facilities. Furthermore, the overview of main trends of the factoring operations turnover it is clear that the industry signals positive trends and the increase of turnover each year, especially in Europe. Thus, companies in Bosnia and Herzegovina need receivables collection optimization, but the factoring sector offering is not acceptable for enterprises. The factoring sector in Bosnia and Herzegovina, having a legal framework in just one part of the country (Federation of the Bosnia and Herzegovina), comprises of only 4 banks in 2020. The only factoring company that existed after the Law on factoring has been passed is now closed. The minimum initial capital for factoring companies is significantly above the minimum initial capital in the neighboring Serbia and Croatia indicating the need to reconsider the possibility of lowering the threshold. Additionally, Law on factoring exists only in the Federation of Bosnia and Herzegovina, so it is of major importance to expand the legal framework to the Republic of Srpska as well, and improve existing regulations.

Factoring arrangements, despite the need for the increased pace of cash flows, are not prioritized by companies due to the high costs of such arrangements. The factor charges interest on the advance payment to the receivables vendor until receivables are collected from the buyer. According to the Law on factoring these interests charges must not be higher than the banking interest rate on short-term loans. Furthermore, the factor charges a fee that must not be higher than 2% of the purchased receivables nominal value. The administrative fee can also be a subject of the contractual agreement in factoring that, depending on the account amount, must not be higher than 50 BAM (25.56 EUR) per account, and refers to operational activities related to factoring services.

Evidently, a more flexible approach is needed towards each client individually, taking into account the specifics of each business relationship. The market in Bosnia and Herzegovina needs local, export, and import factoring operations of a higher quality. The concentration of factoring arrangements to just 4 banks out of 19 banks operating in Bosnia and Herzegovina and no factoring companies clearly leaves enough room for factoring operations improvement. Developing financial markets, such as Bosnia and Herzegovina market, liquidity problems address usually through classic credit arrangements. To be more precise, in Bosnia and Herzegovina every cash flow challenge is met by banks via credit arrangements.

Bosnia and Herzegovina exporters, besides strong competition on European and world markets, also struggle with receivables collection. The efficient method of receivables collection is a purchase of receivables, that is factoring, a financial mechanism allowing companies quick and efficient access to capital, sustainable operations, and development of business. Higher quality offerings and utilization of factoring services would allow companies to improve their business and accelerate cash flows. Thus, it is important to affirm factoring as a funding instrument, but also affirm banks from the perspectives of improving the quality of their factoring offerings so companies would be willing to utilize such services, and not disregard them a priori due to high costs.

ECONOMIC AND FINANCIAL CRISIS AND LOCAL GOVERNMENT UNITS' BUDGETS IN CROATIA[1]

ABSTRACT

The European Commission (2020) has stated that there is a challenging road ahead, arguing that a new economic crisis might be coming. This article, then, analyses what happened during the 2008-2009 economic and financial crisis with aggregate local government units' (LGUs) budgets in Croatia so that lessons for eventual possible future crisis might be drawn. The goal is to analyse officially available Ministry of Finance data for all 576 LGUs (20 counites, 428 municipalities and 128 cities) in order to assess the impact of the 2008-2009 crisis on the level and composition of aggregate LGUs' revenues, expenditures, deficit/surplus and debt. The analysis of the 2002-2018 period shows that the crisis had most visible impact in the period 2009-2012 and that as a consequence of the crisis LGUs typically reacted procyclically to their reduced revenues (by cutting expenditures, especially capital expenditures, and controlling deficits and debts). In the event of any future crisis, national government could decide to help LGUs by underpinning economic growth and employment or to control the size of the local government sector. However, Ministry of Finance should first improve local budget transparency by publishing the appropriate data relating to LGUs' finances (their budgets and balances sheets). This article proves that local budget transparency is crucial, as only transparent budgets can be properly analysed and easily monitored, enabling government and citizens to meaningfully participate in improving the efficiency and effectiveness of public policies.

Key words: *local government units' budgets, economic and financial crisis, budget transparency, Croatia.*

1. Introduction and literature review

Numerous experts (e.g. Elliott, 2019; Gurvich, 2019) and institutions such as the European Commission (2020) have recently warned that the world might be heading for a new economic crisis. The 2008-2009 global financial and economic crisis, sometimes characterised as the worst economic crisis since the Great Depression, which started with a collapse of the housing bubble in the USA and the bankruptcy of the investment bank Lehman Brothers, affected LGUs' budgets all over the world (Ladner & Soguel, 2015). The impacts on LGUs' budgets differed, but many of them experienced the "scissors effect" (reduced revenues and increased expenditures on social services), growing public debt and deficit, which negatively impacted

---

the quantity and/or quality of their provisions of public services (Council of European Municipalities and Regions, 2008; Davey, 2011; Ladner & Soguel, 2015; OECD, 2010).

The focus of this article is on the impact of the 2008-2009 crisis on LGUs' budgets since they are particularly important and visible to citizens, providing them with essential day-to-day services such as education (kindergartens, schools), health, public transport and social welfare. For example on average in 2006 and 2007 subnational governments in OECD countries represented 15% of GDP, 31% of public spending and were responsible for about 66% of public investments (OECD, 2010).

There is very little research about the impact of this crisis on LGUs' budgets (e.g. Council of European Municipalities and Regions, 2008; OECD, 2010; Davey, 2011; Ladner and Soguel, 2015) and even less so in Croatia (Bajo & Stavljenić, 2017; Davey, 2011; Drezgić, 2010). Drezgić (2010) analysed the impact of crisis on Croatian LGU budgets in the period up to 2010, arguing that the effects of the economic crisis are visible through the fall in their revenues and expenditures, concluding that LGUs simply follow the economic shock and that it seems as the overall effect is pro-cyclical. Davey (2011) analysed the impact of the economic downturn on LGUs across all Europe including Croatia. Bajo & Stavljenić (2017) analysed the impact of crisis on LGUs' indebtedness in the 2010-2015 period, concluding that they violated borrowing constraints (due in large part to borrowing by the City of Zagreb).

The important questions are: (1) did the Croatian LGUs during the 2008-2009 crisis try to cushion its impact on demand and employment by increasing public spending and deficits, or (2) did they try to avoid further deficits by using austerity measures and a withdrawal of investments?

Theoretically, LGUs can react to an economic crisis or they can pretend that it does not exist (e.g. Ladner & Soguel, 2015; OECD, 2010). The LGU that pretends the crisis does not exist, simply relies on automatic budget stabilisers, accepting reduced tax revenues, increased expenditures and higher deficits. Automatic stabilisers work mostly through tax revenues and unemployment and welfare benefits (Dolls, Fuest, & Peichl, 2012). Tax revenues generally depend on household income and economic activity. Since an economy slows during a crisis, household incomes fall and LGUs' tax revenues automatically fall too. Furthermore, as there is a rise in the number of unemployed people and those on low incomes, LGUs' expenditure increases automatically. An LGU that decides to react, has two options: first, a counter-cyclical "Keynesian" policy (further reducing taxes and/or increasing expenditures and deficits in order to encourage economic growth) or secondly, a conservative or pro-cyclical policy (reducing expenditures and possibly increasing taxes in order to control deficits) (Ladner & Soguel, 2015). Drezgić (2010) writes that both Keynesian and neoliberal theories agree that during a crisis government need to use deficit financing and lower taxes, i.e. to run a counter-cyclical policy. Neoliberals argue that such an approach raises allocative efficiency, and Keynesians highlight the positive effects of the short-term stabilisation of aggregate demand management policies.

In order to assess LGU reactions during the 2008-2009 crisis, this article uses the data published by the Ministry of Finance for all Croatian 576 LGUs[2] (20 counties, 428 municipalities and 128 cities) in the period 2002-2018. The data in question relate to the level and composition of LGUs' revenues, expenditures, deficit/surplus and debt. Based on the above-mentioned theoretical underpinnings the hypothesis is that as a consequence of the crisis in most of the

---

[2] Regardless of the formal differentiation among the units of local and regional self-government, for the purposes of this article, the term "local government units" covers all 20 counties, 128 cities and 428 municipalities.

LGUs revenues fell and that they reacted by increasing expenditures, deficits and debts. The other hypothesis is that the structure of LGUs' budgets changed, i.e. that as a consequence of the crisis they relied more on national government grants and that they mostly reduced capital expenditures (for non-financial assets).

There is no wonder that there are almost no articles about the impact of 2008-2009 crisis on the aggregate Croatian LGUs' budgets because the important officially published databases needed for such an analysis are incomplete and also of poor quality. Consequently, this article argues that there is a need to improve local budget transparency on the national level, i.e. that the Ministry of Finance has to start publishing better (consolidated, timely and consistent) databases of LGUs' finances (their budgets and balances sheets). Budget transparency implies having an insight into complete, accurate, timely and understandable budget information (Ott, Mačkić, & Bronić, 2018). Along with public participation, it is crucial for good governance as a transparent budget can be properly analysed, and its implementation can be easily monitored, enabling citizens (e.g. legislators, auditors, researchers, media) to analyse the data and participate in improving the efficiency and effectiveness of public policies (e.g. Piotrowski & Vanr Ryzin, 2007; Ríos, Benito, & Bastida, 2017). The Council of Europe in 2011 also argued that in order to overcome the 2008-2009 crisis there was a need for better governance, more transparency and increased public scrutiny in decisions about reduced public resources, increased efficiency across the whole public sector, together with a need to be more aware of the human rights of the most vulnerable families (Davey, 2011).

The rest of this article provides insights into the impact of the 2008-2009 crisis on total LGU revenues and expenditures, the structure of their revenues and expenditures and their debt. It ends with conclusions, limitations and recommendations for further research.

2. Impact on the total revenues and expenditures of the LGUs

Croatia experienced an almost six-year long recession triggered by the 2008-2009 economic and financial crisis, (from the last quarter of 2008, until second quarter of 2014 - Graph 1). Negative growth rates peaked during 2009 and 2010, and after that the recession continued until the second quarter of 2014, but typically with lower negative growth rates.

Graph 1: Croatia gross domestic product – real growth rates (in %)
Source: Croatian Bureau of Statistics, 2020.

Similarly, the 6-year period of recession could be nicely presented using employment and unemployment indicators. From the 2008 until the end of 2014 the number of unemployed persons grew, and the number of employed persons in legal entities declined (except during summers – due to tourist seasons).

Graph 2: Croatia employment and unemployment indicators (in 000)

Source: Croatian Bureau of Statistics, 2020.

Now the major challenge for any sort of analysis of the impact of crisis on aggregate LGU budgets before 2016 is the lack of relevant consolidated officially published data and breaks in those data series. Firstly, no officially published consolidated budget data of all 576 LGUs before 2015 exist, only the consolidated budget data of the 53 largest LGUs (Ministry of Finance, 2019). This means that prior to 2015 it is impossible to accurately calculate even the main fiscal decentralisation indicators (such as the percentage of total LGUs' revenues in total general government revenues, or the percentage of total LGUs' total expenditures in total general government expenditures). Secondly, in 2016 the methodology of presenting LGUs' consolidated budget data changed considerably since remunerations and certain benefits to the primary and secondary education employees paid by the Ministry of Science and Education were included in LGUs' budgets. Before that they were included in the national budget. Due to this methodological change, total LGUs' budget revenues in 2016 increased by HRK 7 bn or 22% (Ministry of Finance, 2015, 2016).[3]

The reader should be aware, while bearing in mind the constraints referred to above, that this article is based on the only officially publicly available financial data for all LGUs, i.e. the 2002-2018 nonconsolidated database of 576 LGU budgets and balance sheets (Ministry of Finance, 2020a). But this database does not include LGUs' budget users (e.g. the kindergartens, schools, hospitals and so on majority-financed from LGUs' budgets).[4] The consequence is, that for example, the City of Zagreb budget revenue and receipts without its 328 budget users in 2018 were HRK 7.8 bn, while in fact its total revenues and receipts including all its budget users were HRK 9.8 bn, i.e. were 25% higher (Grad Zagreb, 2019). Furthermore, due to the methodological changes in this database, during the analysed period there were three breaks between periods (2002-2010; 2010-2014; 2014-2018) without any narrative explanation of these changes.

In 2002-2008 period the LGUs' aggregate revenues and expenditures doubled (from around 12 bn to around HRK 25 bn). The crisis stopped this trend and it took the next ten years for LGUs' revenues and expenditures to reach the 2008 levels (Graph 3). The negative impact of the crisis on total LGUs' revenues and expenditures were most noticeable in the period 2009-2012, while

---

[3] This change was done for the adjustment with the EU statistical data requirements.
[4] For the list of all LGUs' budgetary and extrabudgetary users see the Register of budgetary and extrabudgetary users (Ministry of Finance, 2020b).

after 2012 it seems that a slow recovery started. Only in 2009 were total LGUs' expenditures significantly higher than their revenues and thus this was the only year when they aggregately reported a high deficit (HRK 1.9 bn). In all other analysed years total LGU revenues were almost the same as their total expenditures, i.e. contrary to our hypothesis LGUs usually did not run high deficits, they had a conservative or pro-cyclical policy (probably reducing expenditures in order to control deficits). This is consistent with the OECD (2010) conclusion of trends in LGUs' reactions to the economic cycles during the past 30 years, presenting evidence that LGUs fiscal policy might usually be pro-cyclical (since their budget deficits are less cyclical than national government deficits and they tend to move more quickly towards balanced budgets after the shock).

Graph 3: Aggregate LGUs' revenues and expenditures, in bn HRK
* Receipts from financial assets and borrowing are not included.[5] **Break in database.
Source: Author's calculation based on Ministry of Finance (2020a).

The difference between revenues and receipts and expenditures and outlays can serve as another measure of LGUs' deficit/surplus. Graph 4 shows the same picture as Graph 3, revealing that in most of the analysed years LGUs aggregately did not run bigger deficits/surpluses, i.e. LGUs' revenues and receipts were almost the same as total LGUs' expenditures and outlays. This could be partly explained by the fact that LGUs' fiscal rules (e.g. tax autonomy, balanced budgets and borrowing limits) often restrain debt and lead to pro-cyclical policy (OECD, 2010). In fact in Croatia, the Budget Act (article 7) stipulates that an LGU's budget must be balanced, i.e. that total revenues and receipts must cover total expenditures and outlays. If, during the budget year, expenditures and outlays increase or revenues and receipts decrease the budget must be balanced by identifying new revenues and receipts and/or reducing expenditures and outlays.

---

[5] Briefly, revenues and expenditures are related to non-financial, and receipts and outlays to financial transactions. The terms revenues and expenditures are used in the revenue and expenditure account when it comes to business operations and the purchase and sale of non-financial assets, and the terms receipts and outlays are used in the financing account and relate to financial assets and the granting, taking out and repayment of loans (Ott, Bajo, Bronić, Bratić, & Medak Fell, 2009).

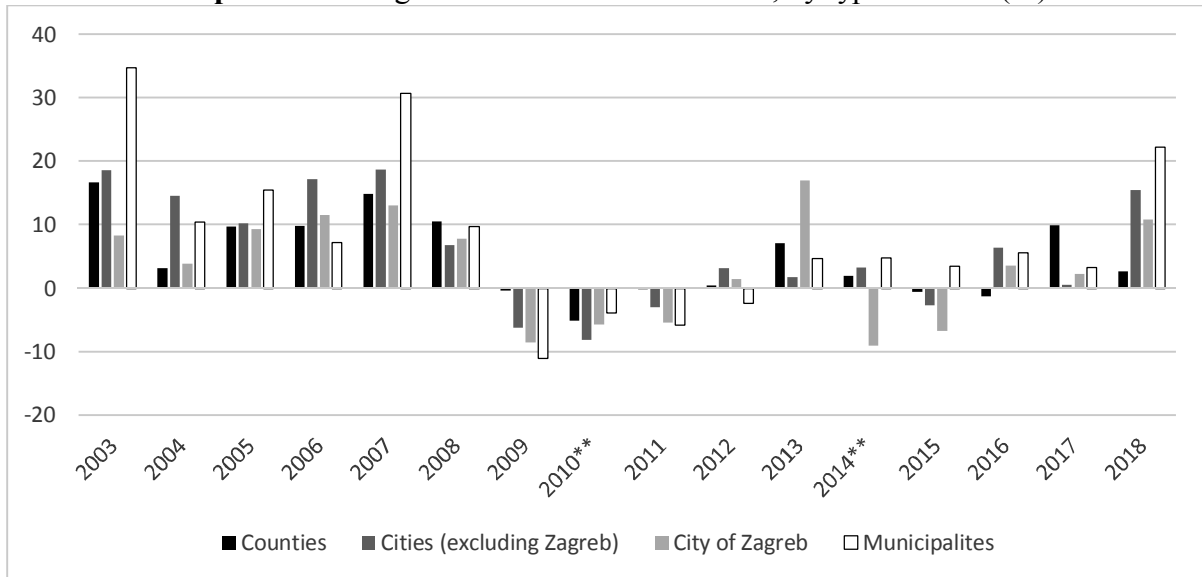
Graph 4: Aggregate LGUs' revenues and receipts and expenditures and outlays, in bn HRK
*Break in database.
Source: Author's calculation based on Ministry of Finance (2020a).*

Graph 5 shows that in the 2003-2008 period, the increases in LGU revenues were relatively high, while in 2009-2011 revenues decreased, starting to recover after 2012 (with the exception of cities, especially Zagreb in 2014[6] and 2015). The personal income tax (PIT) reform as well as the changes in PIT revenue sharing between national and local governments effective from 2015 might have had a smaller or larger effect on the City of Zagreb's 2015 revenue[7], but without deeper analysis it is impossible to know exactly. Furthermore, it should be noted that all changes presented in graph 5 should be interpreted with caution since in the entire analysed period there were smaller or greater changes in PIT and the sharing of PIT with LGUs, which could have affected LGUs' revenues aggregately (PIT is the most important LGU revenue source).

---

[6] In 2014 City of Zagreb revenues were lower than in 2013, mostly because in 2013 Zagreb received extra tax revenues from personal income tax in the amount of about HRK 0.5 bn on the basis of a ruling of the Administrative Court of the Republic of Croatia on entitlement to an additional share in the personal income tax for decentralised functions (Grad Zagreb, 2015).

[7] The most important PIT changes in 2015 included an increase in basic tax allowance and an extension of the personal income tax brackets. PIT revenue sharing between national and local governments also changed since January, 1, 2015, and as a consequence the share of the City of Zagreb in the total PIT revenues was reduced (Grad Zagreb, 2016).

Graph 5: Annual growth rate of LGU revenues, by type of LGU (%)*


* Receipts from financial assets and borrowing are not included. **Break in database.
Source: Author's calculation based on Ministry of Finance (2020a).

Graf 6 shows that in the 2002-2008 period LGU expenditures increased and that contrary to our hypothesis they decreased in the 2010-2011 period. The biggest LGUs' expenditure cut was in 2010 (i.e. much higher than the decrease experienced relating to their revenues the same year). Since 2013 LGUs' expenditures have mainly increased.

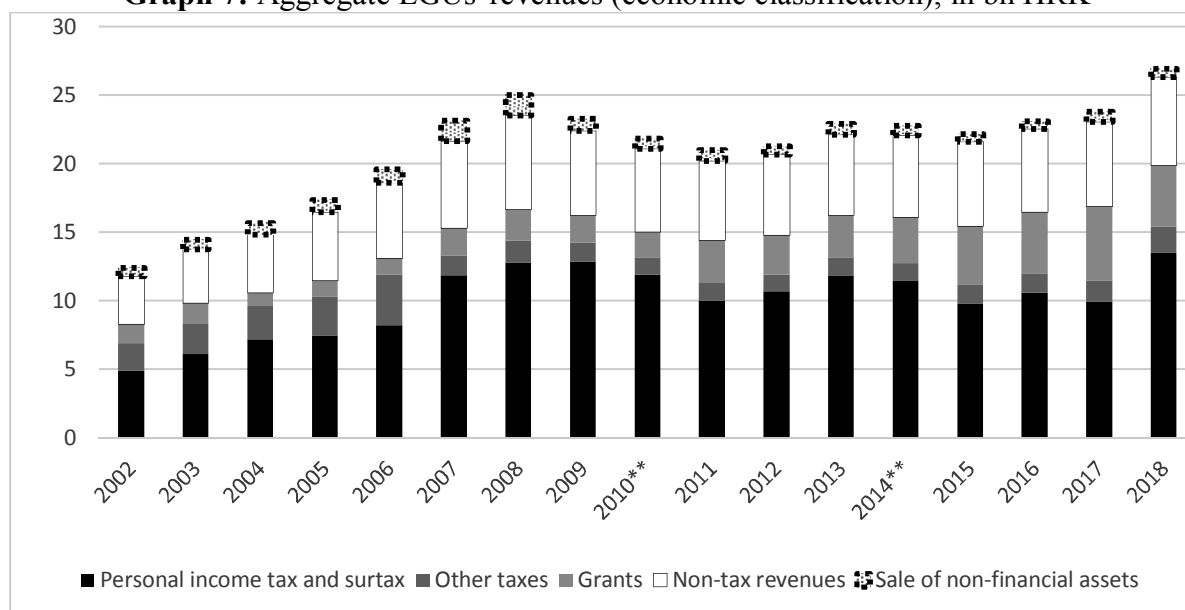
3. Impact on the structure of LGUs' revenues

Graph 7 shows that in the 2002-2008 period LGUs' revenues almost doubled, from HRK 12.4 to 25 bn. As a consequence of the crisis, in the 2009-2011 period they decreased, after that they were slowly recovering and only in 2018 surpassing the pre-crisis 2008 level (amounting to around HRK 27 bn). In the whole of the 2002-2018 period the most important source of LGUs'

revenues was PIT and surtax, followed by non-tax revenues (especially utility contributions and charges) and grants.

Graph 7: Aggregate LGUs' revenues (economic classification), in bn HRK*


* Receipts from financial assets and borrowing are not included. **Break in database.
Source: Author's calculation based on Ministry of Finance (2020a).

Unexpectedly, it seems that the crisis did not have a significant impact on the structure of aggregate LGUs' revenues (Table 1). Although as a consequence of the crisis (especially since 2011) the importance of grants in LGU financing increased it must be noted that the first reason for this change might be related to methodology changes. Until 2010 grants for decentralized functions[8] were booked under PIT, while since 2011 they are presented as grants. Even the OECD (2010), analysing past trends in LGUs' reactions to the economic cycles, argues that in the past intergovernmental grants did not usually smooth the fluctuations of LGUs' revenues, but often exacerbated them, because spending decisions on the higher government level are sometimes delayed and late. The second reason for this structural change might be that since in 2013 Croatia joined the EU, LGUs started to receive more EU grants, which increased the importance of grants in their revenues, and also helped them to speed up the recovery.

One should also notice significant changes in 2007 (Table 1) when due to the tax reform other taxes fell significantly as revenues from corporate income tax were completely transferred from local to the national budget (before corporate income tax revenues were shared between national budget and LGUs). Furthermore, from 2007 the importance of PIT as a source of LGUs' budget increased, as the national government in that year gave a greater share of PIT revenues to the LGUs. This was actually good for LGUs and probably stabilised their revenues during the crisis, since it is usually argued that in times of crisis corporate income tax revenues fall quicker than PIT revenues (Davey, 2011).

Finally, it must be noted that to the extent it is expected that LGUs will not be able to act contra-cyclically on the revenue side. Croatian LGUs have a very low level of tax autonomy (see e.g. Bronić, 2013; Bronić & Franić, 2014) and as argued by OECD (2010) fiscal rules (including

---

[8] Decentralised functions – in 2001 responsibility for part of specific public services (primary and secondary education, health care, social welfare and fire-fighting services) were delegated by government to certain LGUs, for which these LGUs receive additional funding (Ott et al., 2009).

the restrictions on LGUs' powers to increase spending and taxes) often lead to counter-cyclical policy.

Table 1: The structure of aggregate LGUs' revenues, 2002-2018, in %*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

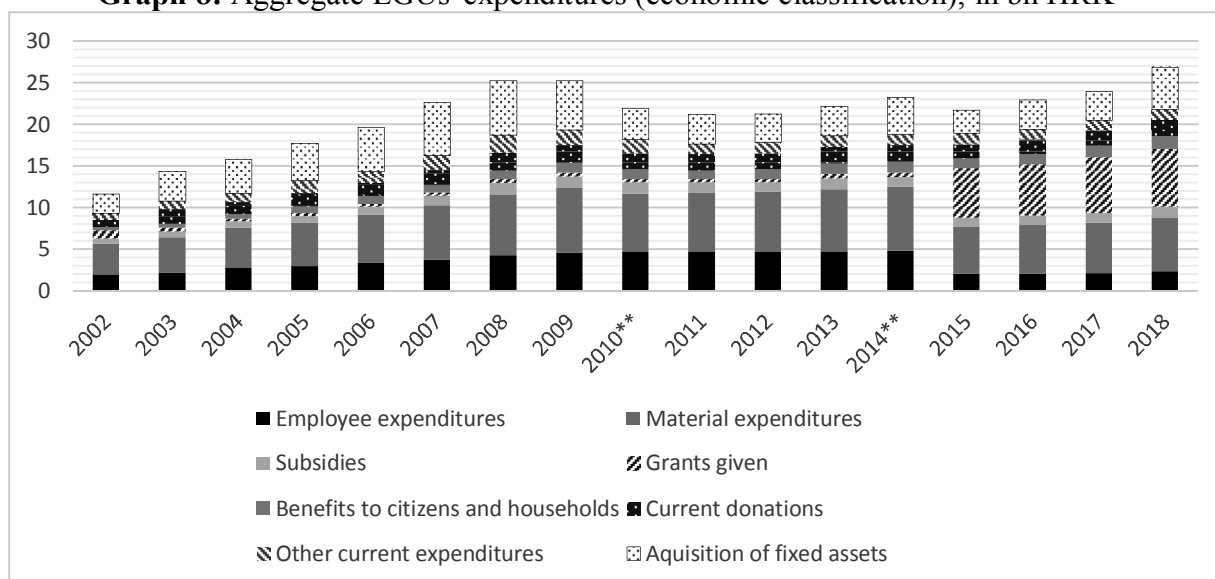
Source: Authors calculation based on Ministry of Finance (2020a).

4. Impact on the structure LGUs' expenditures

Graph 8 nicely shows how LGUs' expenditures peaked in 2008 and 2009 and then fell. LGUs obviously needed some time to react to the crisis as there were no great changes in the level of their expenditures in 2009. It seems that crisis did not have a great impact on the structure of LGUs' expenditures either. Until 2015 they spent most on material expenditures, acquisition of non-financial assets (capital investments) and on employees' salaries. However, since 2015 expenditures for employees, as one of the three most important types of expenditures, were replaced with grants given. The reason for this structural change again comes from methodology changes as remunerations and certain benefits to the primary and secondary education employees paid by the LGUs, before presented as material and employee expenditures, started to be presented as grants to their budget users (kindergartens, schools, etc.).

Graph 8: Aggregate LGUs' expenditures (economic classification), in bn HRK*


* Outlays on financial assets and loan repayments are not included. **Break in database.
Source: Author's calculation based on Ministry of Finance (2020a).

However, Table 2 shows that the share of capital expenditures (i.e. acquisition of fixed assets) in total LGUs' expenditures since 2008 fell and that not even ten years later did it regain its importance. Drezgić (2010) argues that this seems logical, due to the fact that capital investments are the easiest category to cut from a political perspective, but also that in this way the allocative efficiency of the LGUs is reduced.

Table 2: The structure of aggregate LGUs' expenditures, 2002-2018, in %*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

5. Impact on the aggregate debt of LGUs

Direct LGU debt is a sum of all budget deficits incurred in the current and in earlier periods financed by borrowing (i.e. credits, loans and security issues) (Ott & Bronić, 2016). Besides the direct debt, there is also a potential debt, consisting of guarantees mostly issued to LGUs' companies and institutions. As there are no available data about LGUs' guarantees for the complete 2002-2018 period, they are not included in this analysis.

The Budget Act (articles 86 -92) stipulates that LGUs may incur short-term debt to fund their regular activities in cases of uneven revenue collection over the year (without having to obtain any consent) and long-term debt for capital investments (the purchase of non-financial assets) with the consent of the relevant local representative body and the national government's approval. Total annual debt service arising from borrowing, for each LGU may not exceed 20% of its revenues realized in the preceding year.[9]

Although in the 2008-2014 period the direct LGUs' debt increased from HRK 2.6 to 4 bn, the greatest increase actually happened in 2014 when in one-year it increased by almost HRK 1 bn (Graph 10), mostly due to the increase in direct debt of the City of Zagreb (as Zagreb bought the former Gredelj Rolling Stock Factory and "Zagrepčanka" from Zagreb Holding for around HRK 0.9 bn (Grad Zagreb, 2015)).

Graph 10: Aggregate LGU direct debt, in bn HRK
Source: Author's calculation based on Ministry of Finance (2020a).

---

[9] LGUs' borrowing is additionally regulated by other rules and legislation. Thus, the annual national budget execution acts set the overall annual limit for borrowing of all LGUs (e.g. for 2020 overall annual limit for all LGUs together amounts to 3% of their total operating revenues in 2019). For more details about LGUs' borrowing see Ott and Bronić (2016).

It could be argued that LGUs have been constrained in borrowing as a consequence of the crisis due to the relatively rigid borrowing rules. Drezgić (2010) rightly points to the problem with the LGUs' borrowing rules, which are primarily focused on static indicators. For example, total annual debt service arising from borrowing, for each LGU, may not exceed 20% of its revenues realized in the preceding year. However, the problem occurs when as a consequence of the crisis the amount of the repayments usually remains the same as in the previous period while revenues are falling, which might cause liquidity problems and lead to some LGUs breaching the 20% limit. In fact, Bajo and Stavljenić (2017) show that in the 2010-2015 period Croatian LGUs were sometimes borrowing without the consent of the national government and breaking above mentioned borrowing limits. They also claim that for the City of Zagreb – because of its dual status of city and county – borrowing should be defined separately, since it is not only the single biggest borrower, but is also most often breaking the national government's borrowing rules.

6. Conclusion

This article analyses the response of Croatian LGUs to the 2008-2009 economic crisis, hypothesizing that as a consequence of the crisis, revenues in the majority of LGUs decreased and that they reacted by increasing their expenditures, deficits and debts. However, analysed aggregate nonconsolidated data shows that LGUs reacted to the fall in their revenues mostly pro-cyclically (cutting expenditures, running moderate deficits, and not incurring too much debt). This might be explained by the rigid fiscal rules imposed on LGUs (low tax autonomy, balanced budget requirements and strict borrowing limits) which often restrained their indebtedness and resulted in a pro-cyclical policy.

It was expected that the structure of LGUs' budget would have changed as a consequence of the crisis, i.e. that they relied more on national government's grants and that they greatly reduced capital expenditures (for non-financial assets). The analysis showed that LGUs did reduce capital expenditures, but that they did not rely more on national government grants. National government was not particularly helpful in LGUs' coping with the crisis, but luckily, in 2013 Croatia joined the EU, and LGUs started to receive more EU grants which helped them to speed up the recovery.

In the event of some future, similar crisis, national government will have to decide between underpinning economic growth and employment or controlling the size of the local government sector. In the first case, to help LGUs national government should act more contra-cyclically, relaxing some LGUs' fiscal rules (e.g. borrowing limits, giving more tax autonomy) or introducing some short-term measures (e.g. increasing discretionary grants to finance LGUs' investment projects that would not be financed otherwise, temporarily increasing LGUs' share in tax revenues). In addition, national government could immediately opt for territorial reorganisation (particularly solving the problems of small LGUs with inadequate fiscal capacity), increasing the efficiency of LGUs and helping them to cope better with some potentially new crisis.

This article proves that local budget transparency is crucial for any meaningful analysis and decisions, as only transparent budgets can be properly analysed and easily monitored, enabling government and citizens to improve the efficiency and effectiveness of public policies. Thus, the major limitation in any kind of LGU budgets analysis especially before 2016 is the lack of credible officially published data. The nonconsolidated LGU budget and balance sheet data used in this analysis are lacking data about LGUs' budget users (e.g. kindergartens, schools, hospitals), resulting in an underestimation of LGUs' revenues and expenditures. It certainly has

an impact on the structure of the analysed LGUs' revenues, expenditure, deficit/surplus and debt. Accordingly, one of the most important conclusions of this article is that it is necessary to improve budget transparency on the national level, i.e. the officially publicly available LGUs' budget and balance sheet databases. Thus, the Ministry of Finance should finally start publishing the consolidated budget and balance sheet data of all 576 LGUs, of all their budget users and of all the guarantees they issued.

This article also clearly points to another important limitation of the analysis, the numerous methodological changes (breaks) in the Ministry of Finance's database without the appropriate narrative explanations. The researchers might try and might even find some explanations in some other sources; however, one cannot be sure that those are correct explanations, which poses the dilemma whether something could be explained by methodological changes or whether there might be some other causes of the changes. Accordingly, the Ministry of Finance should always give a narrative explanation of all methodological changes (breaks) in the databases that they are publishing.

Knowing how LGUs aggregately reacted to the crisis could inspire further investigations of the reactions of individual LGUs and the usefulness of their actions in the short and long term. Davey (2011) rightly pointed out that there is no one-size-fits-all solution and that LGUs' policy responses depend and should depend on their numerous differences (e.g. are they big or small, rich or poor, how efficient are their institutions). Also, more research could be done analysing how tax reforms or methodological changes have affected LGUs' revenues. However, the main prerequisite for any competent research in this field is the availability of appropriate official data.

THE EFFECTIVENESS OF UNCONVENTIONAL MARKETING IN THEATRES: TOP MANAGEMENT THEATRE PERSPECTIVE

ABSTRACT

Cultural institutions in the Republic of Croatia, specifically theatres, which are in focus of this research paper, are struggling to find the best way to approach and attract audiences, in particular the young audience (Generation Y). Unconventional marketing is not unidirectional, but multidirectional and the proof is that it cannot only be beneficial for theatres, but also for other cultural institutions. By using unconventional marketing, theatres and other cultural institutions can build an audience and, in general, raise the awareness of the role cultural institutions play in the economic development of the country. The aim of the paper is to identify those theatres that are successful in applying unconventional marketing in their business activities. For this purpose, research was conducted on national and city theatres of the Republic of Croatia. After the online data collection process, bivariate statistical methods were applied to test for differences between theatres with and without experience in performing unconventional marketing. An online questionnaire was filled out by theatre management. Theatres are divided into groups of those who have (n = 11) and do not have (n = 30) experience applying unconventional marketing methods in business. Mann-Whitney test results show that those theatres that implement unconventional marketing methods in their promotional activities are more capable of tailoring promotional activities to target groups, especially Generation Y, which is designated as a target group. A statistical difference was also found in the rating of high innovation application (U = 86.5, p <0.05) and the conduct of research (U = 42.5, p <0.001) of those theatres using unconventional methods. The use of innovation in promotion, as well as continuous investment in audience development, are prerequisites for the development of a theatre program for Generation Y and Z.

Key words: *Audience development, unconventional marketing, non-parametric statistics, theatres, research methodology.*

1. Introduction

Research studies aimed at examining the effectiveness of different strategies in creative industries sectors are necessary to bring the industry, which is in the institutionalization phase, closer to younger people, as well as to target groups selected by companies. Theoretical considerations about creative industries start by establishing definitions, and one possible definition states that "creative industries mean copyright-protected production, encompassed by projects that create (in)tangible products and services intended for exchange on the market" (Horvat, Mijoč and Zrnić, 2018, 14-15). In 2015, mapping of creative industries in the Republic of Croatia was made (Rašić Bakarić, Ivana; Bačić, Katarina; Božić, Ljiljana), as well as a proposal for future organization of creative industries, based on twelve sectors. One of the 12 proposed sectors is performing arts, in which theatres are champions of the sector.

This paper contributes to a theoretical explanation of past theatre marketing studies, as well as to overview of definitions of unconventional marketing. The paper analyses a study conducted on theatre marketing professionals ($n = 41$) in Croatia. The research is aimed at examining the implementation of promotional activities by theatres. Theatres are divided into two groups: theatres that have ($n_1 = 11$) and theatres that do not have ($n_2 = 30$) experience in applying unconventional marketing methods. Nonparametric statistical methods were used to explore the implementation of unconventional marketing in theatre promotion and adaptation of promotional activities of theatres to targeted groups.

2. Defining marketing in culture

Heilbrun et al. (2001), Hill et al. (2003), Boter (2005), Bilton (2010), Carls (2012) and Baumgarth et al. (2014) claim that cultural institutions started using marketing in the 1970s with the aim to inform the public about upcoming events and to bring art closer to the audience. That was much simpler in those days because marketing was used only for one-way communication – to transfer certain information. Art that was shown in theatres, museums and other cultural institutions was considered a better form of entertainment than the popular forms of entertainment (e.g. television) and it was implied for such art to be financially supported and attended by audience. According to Kolb (2013), marketing in culture was developed from the artists' need to attract audience and to finance further work because artists were unable to finance themselves; on the other hand, Carls (2012) claims that marketing in culture was created from classic marketing of services.
Meler (2006) defines marketing in culture as a business concept of cultural institutions whose aim is to satisfy the consumers' needs with their cultural products and thus achieve the institutions' missions and their general social objectives. According to Klein (2011), the core of marketing in culture is being able to see things from the consumers' perspective in order to satisfy their cultural needs, and according to Hill et al. (2003) and Henze (2014), the most important thing in this process is creativity.
Carls (2012) indicates that marketing in culture has to be concerned with both current and potential audience, and that this approach should be implemented constantly and strategically.
According to these definitions, it can be concluded that marketing in culture is concerned with the needs of current and potential visitors in order to understand and satisfy their needs for cultural products. According to Buljubašić et al. (2016), the main task for managers in the field of marketing in culture is working on presentation and popularization of cultural and artistic achievements and also encouraging people's contact with art.

3. Definition and previous studies

3.1. Theatre marketing

One of the first marketing studies, conducted by the Ford Foundation to establish the impact of ticket prices and other factors (such as visitors' incomes) on theatre attendance and audience, dates back to 1974. Other authors explored the same topic in the 1980s and 1990s. Withers (1980), Levy-Garboua and Montmarguette (1993) and Gapinski (1986) looked into ways how leisure substitutes, such as reading, cinema, and recreation affect audience attendance of theatre performances. On the other hand, Bonato (1990) investigated the impact of visitors' education on theatre attendance. Felton (1989) studied the effects of ticket prices on theatre subscribers and non-subscribers, and Thorsby (1989) analysed the impact of the quality of theatre plays on attendance. More recently, Walmsley (2012) looked into the motivation that attracts visitors to theatres, Leko Šimić and Biloš (2017) explored the use of websites to attract the young target audience to the theatre, and Besana et al. (2018) investigated the impact of social media promotion on theatre attendance.

Raduški (2013) believes that the main concept of marketing in the theatre is defined by the management, depending on theatre type (national, regional, urban, music, children's, etc.) and management principles (administrative, managerial, project or entrepreneur). The type of theatre has no significant impact on creativity in marketing, merely setting certain frameworks and target groups, while the management principle is of crucial importance in this respect. On the other hand, marketing can and should have a positive impact on the theatre's business and help the management build the principles of organization and management, production, overall business, and the general image of the theatre, define the sales and marketing programmes, the public relations concept and advertising campaign, create repertoire politics, visiting programs, tours and participation at festivals, and define the course of the theatre's research and development.

According to Kerrigan et al. (2004), business tactic is the essence of marketing in theatres. This implies the tactic of successful selection of marketing tools and the manner of communication with the environment. Lukić (2010) claims that marketing in theatres is the procedure of selling tickets or services to the viewer (the consumer). The same author asserts that marketing in theatres uses tools such as promotion, advertising, public relations and audience relations.

The above author hypothesises that theatre marketing is based on sales but also on successful communication with the viewers, which ultimately can contribute to attracting viewers and selling tickets and services. In order to have a successful marketing plan, every person working in marketing in the theatre needs to have precise answers to the questions above. These answers can raise awareness of the state of marketing in the theatre and provide better guidelines for future marketing activities and future marketing plan. Also, according to Chytkova et al. (2012) theatre has a very important role in tradition.

3.2. Defining unconventional (guerrilla) marketing

The term "guerrilla" originates from the military tactics of the famous revolutionary Che Guevara (Biography, 2014). Specifically, it is derived from the Spanish word for "war" and denotes an irregular form of warfare in which small and independent groups use military tactics to fight larger and less mobile armies (Hæreid and Indregård 2015, 19). The word "guerrilla" originates from Spanish and means "small war" (Hutter et al., 2013) or war fought by small independent armed groups outside of the regular army (Anić, 2000). According to Schulte (2007), the word "guerrilla"

represents a group that uses aggression to implement their beliefs and ideologies. In 1983, with the release of "Guerrilla Marketing" by Jay Conrad Levinson, the "father" of guerrilla marketing, the public was introduced to a new revolution in marketing, a revolution that presented two ideas: a) marketing does not have to be expensive to be successful, and b) selling is the easiest job in the world.

Today, guerrilla marketing is the subject of interest for many scientists (and practitioners such as entrepreneurs, managers, etc.), but Hutter et al. (2011) and Kuttelwascher (2010) find that it has not yet been sufficiently analysed scientifically. According to Anlager et al. (2013) and Baack et al. (2008), guerrilla marketing is a synonym for unconventional marketing. Mentioned change of the marketing paradigm through efficiency and effectiveness in the absence of a significant sum of capital and empowered small businesses as well as those that have already established their market dominance. Guerrilla marketing has penetrated all fields and spheres of marketing activities, including culture. Nowadays, guerrilla marketing is also considered to be an art and is based not only on a grand idea, but also on the fact that it is capable of connecting with a well-defined target market. Guerrilla marketing is based on creative marketing, and the key to creative marketing is an intelligent and cunning strategy (Levinson, 2008).

Typical guerrilla marketing strategies are provocative (Levinson, 1984), unexpected (Schwarzbauer, 2009), catchy (Huber et al., 2009), rebellious (Meier, 2014), untraditional (Sandber et al., 2006) and unusual. They cause surprises in unexpected situations and in unexpected places to impressively create interest in one's surroundings. Bruhn et al. (2009), Baartizan (2009), Omar et al. (2009), Prevot (2009), Emsdetlener (2001), Andrews (2011) and Serazio (2009) also lay an emphasis on the effect of surprise. Levinson (2008), Patalas (2006) and Jäckel (2007) consider guerrilla-marketing campaigns to be funny, witty and spectacular.

Unconventional marketing aims to surprise people (to replace the sarcastic eye rolling with a mouth wide open in surprise (Margolis et al., 2008, 16)) and requires exceptional creativity and innovation. It can give cultural institutions a great and unsurpassed advantage, security in an uncertain market, and speed and ease of communication with the users of their services. Unconventional marketing strives to shock (Jurca, 2010) and change entrenched assumptions about marketing (Cova and Saucet, 2014). The business philosophy of unconventional marketing is to achieve maximum results with minimum costs.

The most important difference between conventional and unconventional marketing is the state of mind. The fundamental idea of guerrilla marketing, as the name itself suggests, originated from guerrilla warfare in which atypical tactics were used to achieve goals. In his book "Guerrilla Warfare", written in 1960, Che Guevara defined guerrilla tactics as achieving victory over the enemy using the effect of surprise (Huber et al., 2009) and tactical flexibility (it is necessary to suddenly and unexpectedly attack a place where an attack is least expected, in a way that is not expected, and to very quickly withdraw from the place (Lukić, 2010)). In French, as well as in Croatian, this kind of warfare is often referred to as partisan warfare (Dukić et al., 2012).

The new strategy of guerrilla marketing called "small budget, big results" helped small and medium-sized enterprises by providing an innovative way of promotion during the 1980s crisis in the United States (Hutter et al., 2011). Ever since then, this strategy of guerrilla marketing and this

marketing trend have helped small and medium enterprises maintain a positive cash flow in their business.

According to Chen (2011), guerrilla marketing helped small and medium-sized enterprises in the 1980s fight against large corporations that dominated the market. Small and medium enterprises were able to transmit the right information to the target audience using guerrilla marketing. Ay et al. (2010) claim that, with the help of guerrilla marketing, companies strive to form a kind of marketing management that is dynamic and sensitive to consumers' needs. Guerrilla marketing is a different and alternative way of thinking (technique or method) that achieves conventional goals by unconventional methods and prefers extensive energy and imagination over a large budget (Buljubašić, 2015). Furthermore, by analysing Croatian marketing professionals in a research study, Buljubašić et al. (2016) found that 63% of cultural institutions have never or rarely use unconventional marketing in their promotional activities.

Definitions of guerrilla marketing by all the above authors are obviously similar, defining it as unexpected, personalised marketing and the opposite of traditional marketing. Such marketing seeks to achieve and maximise conventional goals by using unconventional methods and a smaller budget.

Based on previous research findings, the authors test four hypotheses of the paper and draw conclusions about the hypotheses:

H_1: There are differences regarding the implementation of unconventional marketing in Croatian theatres.

H_2: Increasing the recognisability and visibility of the theatre is the main reason for using unconventional marketing to promote the theatre.

H_3: There is a difference between promotional activity of the theatre and customised promotional activity of the theatre intended for the target group.

H_4: Lack of understanding of unconventional marketing is a major obstacle when it is used for promotional purposes in the theatre.

4. Research methodology

The aim of the paper is to better understand unconventional marketing, i.e., to identify ways in which it can be useful in promotional activities of the theatre. The paper examines the effectiveness of those theatres that are more successful in applying unconventional forms of marketing. The research is based on an empirical study of national and city theatres in the Republic of Croatia. According to the Register of Theatres maintained by the Croatian Ministry of Culture, there are five national and 28 city theatres operating in Croatia. The target group are creative professionals employed in marketing departments of theatres. Data were collected between December 2018 and February 2019. The data are analysed using methods of descriptive statistics and nonparametric statistics.

The instrument used for data collection was a highly structured online questionnaire divided into four segments, which was designed using the SurveyGizmo tool. SurveyGizmo estimated that it takes an average of 13 minutes to complete the questionnaire. Since this is a specific group of creatives, the questionnaire was completed by 44 respondents, and 41 respondents met the criteria for further analysis (more than 90% of the answers given).

In the first part of the questionnaire, the focus was on demographic and business characteristics (10 questions). The second part of the questionnaire put the emphasis on promotional activities of the theatre (27 questions), while the third part of the questionnaire addressed standpoints about the audience (19 questions). The fourth part of the questionnaire was related to questions about unconventional marketing (24 questions).

Table 1: Sample description

Variable	n	%	Variable	n	%
Gender			*Education background*		
Men	13	31.7	Economics	30	73.2
Women	28	68.3	Arts	6	14.6
Education level			Technical	2	4.9
High school	2	4.9	Other	3	7.3
Two-year university degree	4	9.8	*Marketing department*		
Four-year university degree	25	61.0	Yes	37	90.2
Master's degree	10	24.4	No	4	9.8

Source: authors

The sample on which the study was conducted consisted of 68.3% of female respondents and 31.7% of male respondents. The majority of respondents (95.2%) have a college or university degree, mainly in the social, economic (73.2%) and art sciences (14.6%). More than 90% of respondents identified themselves as employees in the marketing department.

Table 2: Sample description – job title

Job title	n	%		Cumulative %
Director of promotion/sales	22	53.66		53.66
Marketing associate	9	21.95		77.61
Head of public relations	8	19.51		97.12
Theatre director	2	4.88		100.00

Source: authors

More than half of the respondents (53.66%) are employed as directors of promotion/sales, while others declared themselves as marketing associates (21.95%), heads of public relations (19.51%) and theatre directors (4.88%).
Nonparametric statistical procedures chi-square test and Mann-Whitney U test were used for hypotheses testing.

5. Results and discussion

The research hypotheses focus on the analysis of the implementation of unconventional marketing approach in business activities (Table 3).

Table 3: Previous application of unconventional marketing in the theatre

	n	%	Cumulative %
Yes	11	26.80	26.80
No	10	24.40	51.20
Don't know	20	48.80	100.00

Source: authors

The results show that the majority of theatre marketing professionals (73.2%) did not use unconventional marketing methods in the implementation of promotional activities. These results indicate that there are differences in the implementation of unconventional marketing in theatres, and that this marketing approach is still not included in the promotional strategies of theatres (H_1). Following these results, theatres were divided into groups of those that had ($n_1=11$) or did not have ($n_2=30$) experience in applying unconventional methods in business. In order to identify statistically significant differences between the two groups of theatres with regard to the use of specific methods of promotion, chi-square test was performed (Table 4).

Table 4: Results of the performed chi-square tests

Method of promotion		Unconventional method used in theatre		Test-statistics
		Yes (%)	No (%)	
TV	Yes	0.0	100.0	$p > 0.05$
	No	23.3	76.7	
Radio	Yes	45.5	54.5	$p > 0.05$
	No	46.7	53.3	
Print media	Yes	54.5	45.5	$p > 0.05$
	No	46.7	53.3	
Posters	Yes	72.7	27.3	$p > 0.05$
	No	50.0	50.0	
Leaflets in mailboxes	Yes	54.5	45.5	$p > 0.05$
	No	30.0	70.0	
Friends' recommendations	Yes	81.8	18.2	$p > 0.05$
	No	50.0	50.0	
Notification by email	Yes	90.9	9.1	$\chi^2 = 8.389$,
	No	40.0	60.0	$df = 1, p < 0.01$
Internet (search)	Yes	90.9	9.1	$\chi^2 = 9.478$,
	No	36.7	63.3	$df = 1, p < 0.01$
Social networks	Yes	90.9	9.1	$\chi^2 = 4.197$,
	No	56.7	43.3	$df = 1, p < 0.05$

Source: authors

The identified differences are present precisely in those methods of promotion that are characteristic of unconventional marketing approach: notification by email ($p < 0.01$), the Internet ($p < 0.01$), and social networks ($p < 0.05$). For statistically significant differences, it is observed that those theatres that have experience in applying unconventional marketing methods apply the analysed methods of promotion to a greater extent than the theatres that have not previously had experience in applying unconventional marketing methods. These results further confirm the H_1 hypothesis.

Since the H_2 hypotheses focuses on analysing the reasons for using unconventional marketing methods, Table 5 presents the results of the first group of theatres, that is, those that use unconventional marketing methods.

Table 5: Reasons for using unconventional marketing

	Mean	Std. Deviation
Desire to increase the recognisability and visibility of the institution.	4.64	0.505
Originality and creativity of unconventional marketing.	4.60	0.516
Potential visitors remember this type of promotion longer.	4.50	0.707
Unusualness of unconventional marketing.	4.50	0.707

	Mean	Std. Deviation
This type of promotion is more likely to be noticed by potential visitors.	4.30	0.675
Lack of funding for a conventional marketing campaign.	4.27	0.786
Ease of conducting unconventional marketing campaigns.	4.00	0.667
Education of marketing staff for unconventional marketing.	3.80	0.632
Desire to change the audience structure.	3.36	1.286

Source: authors

The reason *Desire to increase the recognisability and visibility of the institution* stands out with the highest average rating of 4.64, and the average rating of *Originality and creativity of unconventional marketing* of 4.60 indicate the main reasons for implementing unconventional marketing. The lowest average ratings indicate that education of employees about unconventional marketing (3.80) and change of audience structure (3.36) are the variables that are least cited as reasons for using unconventional marketing.

In order to test the H_3 hypothesis, nonparametric Mann-Whitney U-test was used, and statistically significant difference between the two groups of theatres was tested with regard to the application of specific principles and business strategies.

Table 6: Determinants of the theatre business (Mann-Whitney U test)

	(1)	(2)	(3)	(4)	(5)	(6)	(7)
Mann-Whitney U	137.5	106.5	86.5	128	42.5	38	61.5
Wilcoxon W	602.5	571.5	551.5	593	507.5	503	526.5
Z	-0.877	-1.919	-2.424	-1.37	-4.045	-4.023	-3.387
Asymp. Sig. (2-tailed)	0,381	0,055	0,015	0,171	0	0	0,001
Exact Sig. [2*(1-tailed Sig.)]	.424[b]	.085[b]	.019[b*]	.287[b]	.000[b***]	.000[b***]	.002[b**]

a. Grouping Variable: Do you use unconventional marketing methods b. Not corrected for ties.
(1) – promotional activities, (2) – Social networks, (3) – Creative innovations, (4) – Outsourcing, (5) – Marketing research, (6) – Customised promotional activities towards target groups, (7) – Customised promotional activities towards Generation Y
* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$
Source: authors

The results of Mann-Whitney U test show that theatres that apply unconventional marketing methods within their promotional activities are more able to adapt promotional activities to target groups (U = 38, p < 0.001), especially Generation Y (U = 61.5, p < 0.01), which is identified as the target group, and the H_3 hypothesis is not rejected. A statistically significant difference was also found in the rating of high creative application of innovation (U = 86.5, p < 0.05) and of conducting research for the purpose of marketing (U = 42.5, p < 0.001) of those theatres that apply unconventional methods.

Table 7: Assessing the obstacles to (non) use of unconventional marketing (Mann-Whitney U test)

	(1)	(2)	(3)	(4)	(5)
Mann-Whitney U	64.5	55.5	108.5	99	136
Wilcoxon W	119.5	110.5	163.5	154	191
Z	-2.92	-3.277	-1.496	-1.759	-0.467
Asymp. Sig. (2-tailed)	0.003	0.001	0.135	0.079	0.641
Exact Sig. [2*(1-tailed Sig.)]	.006[b**]	.002[b**]	.198[b]	.116[b]	.678[b]

a. Grouping Variable: Do you use unconventional marketing methods. b. Not corrected for ties.
(1) – Lack of experience and knowledge, (2) – Lack of creativity, (3) – Conservative leadership, (4) – Scepticism, (5) – Fear of damaging the image of the institution
** $p < 0,01$
Source: authors

Two statistically significant determinants have been recorded when identifying significant obstacles to (non) use of unconventional marketing methods in theatre operations. The results of Mann-Whitney U test have shown that lack of knowledge and experience ($U = 64.5$, $p < 0.01$), and lack of creativity ($U = 55.5$, $p < 0.01$) are statistically significantly different between the two groups of theatres. This confirms the lack of understanding of the use of unconventional marketing methods in theatre promotion by the group of theatres that have not decided to take this business approach.

6. Final considerations

The application of unconventional marketing methods in the theatre business in the Republic of Croatia is undergoing a strengthening process. *The aim of the paper was to find the differences between those theatres that are successful in applying unconventional marketing in their business activities.* Although most theatres in the Republic of Croatia have not implemented unconventional marketing strategies in their business activities, it was determined that increasing recognisability and visibility of theatres is one of the main factors for using unconventional marketing methods in theatre promotion. Those theatres that have implemented forms of unconventional marketing in their business are more able to adapt promotional activities to target groups, but also to younger age groups (Generation Y). Lack of knowledge and experience, and lack of creativity in the application of unconventional marketing are identified as the main obstacles to its use. Research limitations are reflected in the inability to compare each theatre with its target audience. Further study of the effects of different marketing strategies on specific groups of visitors is needed. The sample frame should also be improved and include other employees in theatres that have the possibility to make decisions.

Unconventional marketing has great market potential based on innovative and creative ideas that will interest younger age groups, as well as develop strategies to attract target groups. The paper identifies the factors that affect successful implementation of unconventional marketing in theatres, and given the lack of science-based research, it is necessary to develop new mechanisms for implementing unconventional marketing methods for business purposes. This paper provides a basis for future research, as well as for identifying important influences for better understanding of unconventional marketing in theatres.

POTENTIALS OF ACTIVE TOURISM IN THE AREA OF SLAVONIA AND BARANJA

ABSTRACT

On the basis of human needs, motives, leisure time and financial independence among tourists there is a desire to travel and vacation. Nowadays, "sun and sea" are not strong enough factors to attract tourists to the destination. Because of that, tourist are increasingly turning to active vacation in the destination by consuming sport recreational, cultural, eno and gastro activities. Taking into account the current trends and the opening up of markets, especially towards the Far East countries, the potential for tourism development on the continent of the Republic of Croatia and/or Slavonia and Baranja, opens up the possibility of significant growth and development of continental tourism.
The main objectives of this paper are to define existing activities, infrastructure, human resources, available financial resources and key stakeholders in active tourism in the area of Slavonia and Baranja.
The primary data obtained by the research and the existing secondary data will be used in the paper.
The results of this paper will be reflected in the review of the entire offer of the activities in field of active tourism, elaboration of guidelines for further development of active tourism in Slavonia and Baranja and for creation of new products and services in active tourism.

Key words: potentials, active tourism, Slavonija and Baranja.

1. Introduction

According to the information available by the UN World Tourism Organisation International (in continuation of tekst UNWTO) the number of tourist arrivals (overnight visitors) grew 4% in the period since January to September 2019. compared to the same period last year, with mixed performance among world regions. The Middle East (+9%) led growth followed

by Asia and the Pacific and Africa (both +5%). Europe (+3%) and the Americas (+2%) enjoyed a more moderate increase.[1]

Also according to the UNWTO, the reasons of weighed on growth in international tourism. are global economic slowdown, trade tensions and rising geopolitical challenges, social unrest, Brexit and lower business confidence.[2]

In line with positive consumer trends in tourism:

- Travel „to change" (live like a local, quest for authenticity and transformation,
- Travel „to show" (instagramable moments, experiences and destinations)
- Pursuit of a healthy life (walking, wellness and sports tourism)
- Rise of the „access" economy
- Solo travel and multigenerational travel (as a result of aging population and single households)
- Rising awareness on sustainability (zero plastic and climate change).[3]

Croatian tourism quite slowly following the global tourist trends and adapting to them.

Despite to the slow adaptation of the consumers trends in tourism, Croatian tourism is still achieving great results.

According to eVisitor data, in 2019 the number of arrivals of foreign tourists amounted to 18,267,166 (growth of 4.4%), while at the same time 2,424,455 arrivals of domestic tourists (growth of 9.0%) were recorded. Over the same period, there were 94,812,813 overnight stays of foreign tourists (an increase of 1.7%) and 13,830,741 overnight stays of domestic tourists (an increase of 7.6%). The total (foreign and domestic) arrivals in 2019 amounted to 20,691,621 (an increase of 4.9%), while at the same time 108,643,554 nights (an increase of 2.4%) were recorded.[4]

Active tourism is a new travelling philosophy that combines adventure, ecotourism and cultural aspects of a discovery tour. Active Tourism is low-impact, ecological, socially compatible and high quality. Active Tourism aims to combine recreation, education and bring benefits to both the tourist as well to the visited land. Active Tourism has many aspects in common with ecotourism and nature tourism and it also integrates some activities of action and adventure tourism.[5]

The data on discovering the potentials in active tourism in the region od Slavonia and Baranja collected for this research was for 2019, which is a representative sample of 108 respondents aged 25-48+. The survey was conducted between March 5 and April 1, 2019 via a link to a survey questionnaire, which was available on a social network (Facebook) in the recreational and athletic group, and through the author's personal contacts with the respondents. Segmentation within the group of domestic active recreational athletes was performed on a 15-item scale. In addition to the descriptive analysis, segmentation was performed according to the motives and expectations described by the sociodemographic variables. The conclusions obtained in the section based on the research are expressed at the end of the paper, together with the proposed methods for further development additional sports content and infrastructures in accordance with the attitudes and preferences of domestic active recreational athletes.

2. Research methods

Appropriate scientific methods (inductive and deductive method, method of abstraction, descriptive method, descriptive statistics and sample method) were used in the paper in order to achieve a high-quality analysis of the defined subject and to further the knowledge on the explored topic. The paper discusses theoretical issues; therefore, the dominant method of research is the study of professional and scientific literature on tourism. Additionally, analysis of attitudes, motives and expectations of domestic active recreational athletes in regard to the further development additional sports content and infrastructures was conducted. Descriptive statistics were used to summarize a given data set. As mentioned, segmentation of domestic domestic active recreational athletes based on an 15-statement scale was conducted.

3. Analysis of the current state of tourism in Slavonia and Baranja

In this part of the paper we will analyze the continental tourist region of Slavonia and Baranja..
The territory of Slavonia and Baranja is divided between five counties: Vukovar-Srijem county , Osijek-Baranja county , Požega-Slavonia county, Virovitica-Podravina county and Brod-Posavina county.

Graph 7: Positive characteristics for development of active tourism in the area of Slavonia and Baranja
Source: authors

According to the Graph 6. Positive characteristics for development of active tourism in the area of Slavonia and Baranja the 93 of respondents consider that Gastronomic offer is main positive characteristic for development of active tourism in the area of Slavonia and Baranja, while 15 of respondents not consider, 71 respondents consider that Hospitality is positive characteristic for development of active tourism in the area of Slavonia and Baranja, while 37 of respondents not consider, 68 respondents consider that Value for money is positive characteristic for development of active tourism in the area of Slavonia and Baranja, while 40 of respondents not consider, 56 of respondents consider that Geographical location is positive characteristic for development of active tourism in the area of Slavonia and Baranja, while 52 respondents not consider, 35 respondents consider that Climate conditions is positive characteristic for development of active tourism in the area of Slavonia and Baranja, while 73 respondents not consider.

Graph 8: Negative characteristics which affect to the further underdevelopment of active tourism in the area of Slavonia and Baranja
Source: authors

According to the Graph 7. Negative characteristics which affect to the further underdevelopment of active tourism in the area of Slavonia and Baranja the 66 respondetns consider that Lack of sports infrastructure is main negative characteristic for development of active tourism in the area of Slavonia and Baranja, while 42 respondents not consider, 62 respondents consider that Unrecognizable of destinations is negative characteristic for development of active tourism in the area of Slavonia and Baranja, while 46 respondents not consider, 57 respondents consider that Lack of cooperation between local govermment and with the tourism sector is negative characteristic for development of active tourism in the area of Slavonia and Baranja, while 51 respondents not consider, 56 respondents consider that Insufficient use of EU funds is negative characteristic for development of active tourism in the area of Slavonia and Baranja, while 52 not consider, 36 respondents consider that Inappropriate trafic connections is negative characteristic for development of active tourism in the area of Slavonia and Baranja, while 72 respondents not consider.

5. Conclusion

Tourism has proved itself to be an important sector and a crucial source of income in Croatia, as well as the world. In the first nine months of 2019 year Croatia has achieved 86.6 million overnights tourists, what in a relationship for the same period in 2018, it does an increase of 3.6 %.

Analyzed by counties in the Adriatic Croatia, the largest number of overnight stays in the period from January to September 2019 it was realized in the County of Istria (25.6 million), while in Continental Croatia the largest year on year increase of overnight stays was recorded in Vukovar-Srijem County (67.5 %). In the said period Vukovar-Srijem County was recorded 159.259 overnight stays and 78.164 arrivals, Osijek-Baranja county recorded 97.161 overnight stays and 57.523 arrivals, county of Brod-Posavina was recorded 44.769 overnight stays and 28.158 arrivals, county of Virovitica-Podravina was recorded 36.564 overnights stays and 13.099 arrivals and county of Požega-Slavonia was recorded 31.137 overnight stays

and 14.419 arrivals. Although the aforementioned counties from Slavonia and Baranja recorded an increase in the number of overnights stays and arrivals, the average number of overnights stay is 2 days.

Analysing the overnight stays and arrivals in Slavonia and Baranja, with an emphasis on active sporting events, the increase is visible especially during certain events in the destination (Pannonian Challenge, Osijek half marathon, Ferivi Baranja half marathon, Good world cup, Wine Bor marathon, Tour de Croatia etc.).

The results of the research are testimonials of the attitudes of domestic recreational athletes and athletes from almost the entire Republic of Croatia.

Based on the research available in this paper, we can conclude that Slavonia and Baranja has potentials primarily in cycling, organizing B2B events, sport fishing, hunting, horseback riding and hiking. As positive characteristics for development of active tourism in the area of Slavonia and Baranja respondents in this research claim: gastronomic offer, hospitality, value for money, geographical location, climate conditions. Whereas for the negative characteristics which affect to the further underdevelopment of active tourism in the area of Slavonia and Baranja, respondents in this research claim: lack of sports infrastructure, unrecognizable of destinations, lack of cooperation between local govermment and with the tourism sector, insufficient use of EU funds, inappropriate trafic connections.

The tourism potential in Slavonia and Baranja is unquestionable. Its further growth and development requires significant investments of public, private and EU funds in sports infrastructure, transport infrastructure (air routes and airport modernization, cycling paths, roads, railways, etc.) accommodation (especially bike and bed), education of tourist workers, organization of significant sports events, networking of all selective types of tourism (health, cultural, eno and gastro tourism), continuous promotion of destinations of Slavonia and Baranja at national and international level.

THE INFLUENCE OF TRADITION AND NUMBER OF EMPLOYEES ON THE COMPETITIVENESS AND PROFITABILITY OF ENTERPRISES IN THE METAL PROCESSING INDUSTRY

ABSTRACT

The pathway of each enterprise, as well as the economy, should be the creation of competitive advantage, and gaining of unique market position. It is important to understand historical and economic heritage same as impact of large number of employees on competitiveness and profitability of metal processing industry in Republic of Croatia. Today, industrial production is getting again the growing importance. Todays development is continuation of the historical heritage, but for competitiveness, country needs to turn to new industries, knowledge and markets. Global economic trends push enterprises to have a well-designed human resource strategy i fit wants to be successfully positioned on the market and to achieve competitiveness. This paper has three main goals: to present theoretically competitiveness as an element for reaching profitability, to explain division of metal processing industry in Croatia and to research influence of tradition and nuber of employees in enterprises on competitiveness and profitability in metal processing industry.

Methodology of research is statistical analysis (Spearman's correlation, Kruskal Wallis test) *of 508 enterprises in sectors C24, C25 and C28 according to NKD 2007 (data are taken from portal Business Croatia). In this paper are analysed large size, small and medium enterprises from all Croatian counties (21 counties). The SPSS statistical program (version 16.0, SPSS Inc., Chicago, IL, USA) was used for statistical analysis in this paper.*

Reesult of the paper is correlation between number of employees and 28 economic parameters (such as EBIT, EBITDA, ROA, ROE, export/import and so on) in metal processing industry. Also, how number of employees in each enterprise effects on each parameter and what it's significance.

Nowadays, is necessary to find strategic models according to set parameters, how human resource sector (number of employees) can develop and increase a competitive position and regional leadership.

Key words: *tradition, competitiveness, strategy, profitability, parameter.*

1. Introduction

This paper systematically describes and analyse tradition and employee's influence on metal processing industry in Croatia. Metal processing industry has always had an important place in the development of the economy. Today this industry is trying to reach former level of business. The problem is poor competitiveness and technological obsolescence of production capacity, and the disappearance of the traditional market in which they offer products. In the transition period, the role of industry is completely neglected, but nowadays is developing understanding

of its value. "Metal processing industry is one of the strongest influences on the manufacturing industry, but also on the economy in the Republic of Croatia. In a global postindustrial economy the role of company strategy is becoming increasingly important. This is particularly significant for a small transition country such as Croatia. Strategy is used for improving performance and management, and as a tool for achieving competitive advantage". (Duspara, Požega, Crnković, 2017., p.579) This paper analyses the influence of tradition and number of employees on the competitiveness and profitability of enterprises in the metal processing industry.

2. Competitiveness and strategy

Metal processing industry is one of the oldest branches of industry in the Republic of Croatia. It is the reason of great importance in the industrial tradition and has historically been a major part of the workforce. Now, that industry does not quote very well, so it is important to implement strategy models and methods to reach better competitiveness. Strategy is one of the key factors in enterprise that enables development of competitive advantage. Strategies can be divided in groups: general business strategy and individual strategies of particular functions; strategies that create change and new markets, business strategies on foreign markets, external strategy, human resources strategy and others. Strategy is a term used to improve business and achieve competitive advantage in the market. Over the last few decades, the nature of the business world has changed considerably under the influence of new trends in the economy. That's why there is a new term in economy called hypersompetitiveness. "Hypercompetition and competitive dynamics are essential for understanding how dynamics and competitive intensity of business environment lead to temporary competitive advantage. Theoretical approach of competitive dynamics shows that relationship between fi rm´s strategy and fi rm performance primarily depends on fi rm strategic behavior." (Daraboš Longin, 2018. p. 231) So one of mayor problems is implementation of strategy and achieving a competitive advantage in times of hyper competition in metal processing industry based on human resource developement.

Competitiveness is the ability to coexist with other institutions under the conditions of conflict of interest. This type of coexistence (competitiveness) can relate to several levels: "Ability to survive - the lowest level of competitiveness, refers to the ability to adapt to a competitive environment without significant change or development. Ability of development - refers to the medium level of competitiveness, ie the ability to react actively to changes in a competitive environment and improve the quality and activity. Superiority - the highest level of competitiveness refers to the ability to influence a competitive environment through more efficient work, faster development and better quality than competitors." (Reiljan, Hinrikus, Ivanov, 2000., p.11). „The issue of identifying the presence of competitive advantage, as a result of adequate patterns of resource/competence utilization and complementarity"(Talaja et.al., 2017.,p. 587)

The European Commission (2001., p. 75) defines competitiveness as the ability to produce goods and services that will respond to the challenges of international markets, while retaining a high and sustainable level of income or, more generally, the ability to produce, by the pressures of external competition, a relatively high income and the level of employment. Economic theory speaks of the competitiveness of enterprises and the competitiveness of the state.

"Competitiveness is most commonly defined at enterprise level. Competitive is an enterprise that can produce better quality products and lower costs than its rivals. Enterprise competitiveness has three dimensions: cost efficiency, quality and relative performance. The definition of industrial competitiveness is analogous to the company's competitiveness. However, industrial competitiveness inevitably involves a territorial dimension. The industry is defined as a group of companies of similar activities from a particular region or country, and its competitiveness is assessed by groups of producers with similar activities from other regions and countries. At national level, competitiveness is defined as the ability to compete with other countries." (National Competitiveness Council, 2004., p. 10)

3. Main characteristic of metal processing industry in Coratia

Metal processing industry have a long tradition and impact on Croatian economy. "On a daily social change which, as a consequence of globalization, have caused awareness raising and increased pressure not only by civil organizations, but also by governments and other groups which may influence the activities of the business sector. The consequence of these changes is a more important role of responsible business practices in the process of achieving business competitiveness. Therefore, sustainable business practices are becoming an important means of attaining added value and, consequently, business competitiveness." (Tanković, Matešić, 2009, p.79) Nowdanys metal processing industry is classified as part of industry sector.

"According to the National Classification of Activities 2007 (NKD 2007) metal processing industry belongs to the "area C" which contains the industry, which deals with the transformation of materials into new products. Classification of economic activities can often be unclear about the boundaries between manufacturing and other sectors of the classification system." (Croatian Bureau of Statistics) It is noteworthy that such activity classification is applied since 2008; until then, another classification methodology was applied. Sector of the metal processing industry includes:
- C24 Manufacture of basic metals
- C25 Manufacture of fabricated metal products, except machinery and equipment
- C28 Manufacture of machinery and equipment.

"Activity C24 includes melting and / or refining ferrous and unwanted metals from ore or scrap, using electro metallurgic and other process of metallurgic techniques. Activity C25 includes the manufacture of "pure" metal products (such as parts, containers and structures). Activity C28 includes the manufacture of machinery and equipment that act independently on materials either mechanically or thermally or perform operations on materials including their mechanical components that produce and apply force, and any specially manufactured primary parts." (Industrijska strategija Hrvatske 2014.-2020)

4. Methodology

Analysis of enterprises in metal processing industry is conducted on data from the portal Business Croatia in 2015 year. Metal processing industry analysis is based on three sectors - according to NKD 2007 (National Classification of Activities), sectors C24, C25 and C28. In this paper are analyse large size, small and medium enterprises. The simple included 15 large enterprises (total population), 93 medium size enterprises and 400 small size enterprises.

A sample of enterprises was taken from all Croatian counties (21 counties). Sample is proportional to the number of small enterprises registered in each county. It analysed in total

508 (large, small and medium-sized) enterprises in the metal processing industry in the Republic of Croatia.

5. The influence of tradition and number of employees on the competitiveness and profitability of companies in the metal processing industry

In this chapter is research of metalprocessing industry. It is analysed how tradition and number of employees have influence on profitability and competitiveness of small, medium and large rnterprises in the metal processing industry in Republic of Croatia. The research is based on hypotesis that follows in the text below.

H1: The metal processing industry is based on tradition and a large number of employees that are significantly positively correlated with the competitiveness and profitability of companies

To test Hypothesis 1: The metal processing industry is based on tradition and a large number of employees that are significantly positively correlated with the competitiveness and profitability of these companies. Spearman's correlation coefficient, which is a nonparametric equivalent of Pearson's correlation coefficient (product of rank correlation), will be used to evaluate the association. Measuring the correlation between variables (number of employees with observed parameters: credit rating, year of foundation, number of members of the Management Board, average net salary of employees, total income and expenses, EBITDA, EBIT, EBT, corporate tax, net profit, newly created value, productivity, money , exports and imports, assets / liabilities, long term assests and current assets, capital and reserves, liquidity ratio, Altman Z scor, days of receivables and payables in days, operating margin, cash cycle in days, ROE, ROA, employee income and net profit per employee). This indicators are chosen as a main financial dana, and were taken form Business Croatia for each enterprise.

The cases in which the Spearman coefficient is used are e.g. when there is no linear relationship among the variables, and it is not possible to apply a corresponding transformation to translate the relationship into a linear one. Spearman's correlation coefficient as a result gives an approximate value of the correlation coefficient treated as its sufficiently good approximation. The calculation of the coefficient is done by using the values of the assigned ranks. The Spearman coefficient is denoted by Rho (ρ)). The basis of Spearman's rank correlation coefficient are pairs of modalities of rank variables or numerical variables transformed into rank variables. Modalities are each rank variable from the set of first n positive integers. If in each pair the ranks are equal, their differences are equal to zero, and the coefficient assumes a value of 1, in which case there is a complete positive correlation of the ranks. When the order of modality of one rank variable is reversed from the order of another variable in the pair, the coefficient will take on the value -1, so the correlation rating is complete and negative. If the significance level is 0.05, the decision is made by comparing the test magnitude (sample rank correlation coefficient) with the critical value of the sampling distribution of the rank correlation coefficient for probability, that is, for the significance level and sample size. The alternative hypothesis contains the opposite claim that there are tendencies that large values of one variable are paired with large values of another variable (positive association) or that large values of one variable are associated with small values of another variable (negative association). Correlation coefficient values greater than 0.5 and less than -0.5 are said to be good, ie, the closer the number to 1 or -1 the correlation is excellent.

Two assumptions will be made for the test:
H1.1: there is no correlation between the number of employees and the observed parameters,

H1.2: there is an association between the number of employees and the observed parameters.

The significance level of the test was set at $\alpha = 0.05$. Thus, if the significance level of the test is less than 5% (significance level of 5% equals 95% confidence), assumption H1.1 will be rejected and alternative assumption H1.2 will be accepted, ie there will be significant correlation between the number of employees and of the observed parameters. If the significance is greater than 5%, H1.2 will be rejected and H1.1 will be accepted, that is, no statistically significant correlation will be demonstrated between the number of employees and the observed parameters.

The connection of all observed parameters with the number of employees is significant. The strongest positive relationship between the number of employees is with total revenues ($\rho = 0.929$), total expenses ($\rho = 0.923$) and newly created value ($\rho = 0.967$).

A very good positive correlation is with both total assets / liabilities ($\rho = 0.811$) and current assets ($\rho = 0.831$). The weakest correlation between the number of employees and the rate of return on equity (ROE) ($\rho = 0.146$). Companies established earlier have a larger number of employees, that is, a negative correlation ($\rho = -0.253$), and the number of employees increases by reducing the days of claims receivable ($\rho = -0.110$) or the days of liabilities ($\rho = -0.110$).

Spearman's correlation coefficient is used to evaluate the correlation between the number of employees and the observed parameters. Good correlation (greater than 0.500) of the number of employees with most parameters has been demonstrated. Since the correlation coefficient (Rho) $\rho > 0.500$ and significance is less than 0.05, we accept the assumption of H1.2 that there is a significant correlation between the number of employees and the observed parameters.

It is clear from the above that Hypothesis 1.2 is confirmed (Table 1).

Table 1: Spearman correlation coefficient of the number of employees with observed parameters

	Spearman correlation coefficient (Rho) ρ of the number of employees	p
Year of foundation	-0,253	<0,001
Number of members of the Management Board	0,317	<0,001
Average net salary of employees	0,679	<0,001
Total income	0,929	<0,001
Total expenses	0,923	<0,001
EBITDA	0,676	<0,001
EBIT	0,587	<0,001
EBT	0,586	<0,001
Corporate tax	0,468	<0,001
Net profit	0,580	<0,001
Newly created value	0,967	<0,001
Productivity	0,462	<0,001

	Spearman correlation coefficient (Rho) ρ of the number of employees	p
Money	0,659	<0,001
Exports	0,766	<0,001
Imports	0,638	<0,001
Assets / Liabilities	0,811	<0,001
Long term assests	0,737	<0,001
Current assets	0,831	<0,001
Capital and reserves	0,767	<0,001
Liquidity ratio	0,239	<0,001
Altman Z score	0,246	<0,001
Days of receivables	-0,190	<0,001
Payables in days	-0,110	0,011
Operating margin	0,182	<0,001
ROE	0,146	0,001
ROA	0,292	<0,001
Employee income	0,371	<0,001
Net profit per employee	0,215	<0,001

Source: author

In order to check the difference for individual parameters by number of employees, enterprises are divided into three groups according to the number of employees: up to 10 employees, from 11 to 50 employees and enterprises with more than 50 employees.

To test Hypothesis 2: The metal processing industry is based on tradition and a large number of employees. The difference in parameters will be displayed: credit rating, year of foundation, number of members of the Management Board, average net salary of employees, total income and expenses, EBITDA, EBIT, EBT, corporate tax, net profit, newly created value, productivity, money, exports and imports , assets / liabilities, non-current and current assets, capital and reserves, current ratio, Altman Z scor, days of receivables and payables in days, operating margin, cash cycle in days, ROE, ROA, employee income and net profit per employee) by groups by number of employees.

The Kruskal Wallis test, which is a nonparametric analog of the ı test as part of the variance analysis, will be used to test for differences. When conducting the Kruskal Wallis test, one assumes that random and independent samples were selected from the K base sets or equivalent, a completely randomized trial design, and that the base sets are equally distributed; the third thing to begin with is that the values of the measurement are on a rank, interval, or numerical scale. It is assumed that all data taken as a whole (n) are ranked by their respective samples. The lowest rank is 1 and the highest n. If more than one value appears among the data, each is assigned an average rank, in which case it is a related rank. In the ranking process, the data in the samples do not change position, that is, they remain in the same samples (groups). The null hypothesis contains the assertion that the basic sets have equal medians and the alternative holds the opposite claim.

Two assumptions will be made for the test:
H1.1: there are no differences between the number of employees and the observed parameters,
H1.2: there are differences between the number of employees and the observed parameters.

The significance level of the test was set at $\rho = 0.05$. Thus, if the significance level of the test is less than 5% (significance level of 5% equals 95% confidence), assumption H1.1 will be rejected and alternative assumption H1.2 will be accepted, ie there will be a significant difference between companies with given the number of employees and the parameters observed. If the significance is greater than 5%, H1.2 will be rejected and H1.1 will be accepted, that is, no statistically significant difference will be demonstrated between the companies in terms of the number of employees and the observed parameters.

The credit rating is highest for companies with up to 10 employees, 8 (interquartile range 4-11) compared to enterprises with 11 to 50 employees or more than 50 employees, where the credit rating is 4 (interquartile range 1 to 7) (Kruskal Wallis test, $p < 0.001$). The average net salary is the largest in enterprises with more than 50 employees, it amounts to HRK 4,988.5 (interquartile range HRK 4,247.25 to HRK 5,724.5), compared to the average net salary in enterprises with up to 10 employees, where 2,539 kn (interquartile range 0 to 4,051 kn) or in those with 11 - 50 employees, with an average salary of 4,463 kn (interquartile range 3,448 kn to 5,337.50 kn) (Kruskal Wallis test, $p < 0.001$). Total revenues are significantly lowest in enterprises with up to 10 employees and amount to HRK 457,200 (interquartile range HRK 71,600 to HRK 1,333,800) compared to enterprises with 11 - 50 employees with a median total income of HRK 6,863,100 (interquartile range 4,448,600 to HRK 12,766,450), or compared to enterprises with more than 50 employees where the median total income is HRK 74,558,450 (interquartile range HRK 42,097,125 to HRK 156,450,325) (Kruskal Wallis test, $p < 0.001$).
 The same principle applies to total expenditures, with companies with the least employed having HRK 477,100 (interquartile range HRK 98,800 to HRK 1,315,000) significantly lower than enterprises with more than 50 employees where expenditures are HRK 63,246,450 (interquartile range 39,176 675 HRK to $ 152,342,125 HRK) (Kruskal Wallis test, $p < 0.001$).

Significantly higher profit before interest, tax and depreciation (EBITDA), that is, the difference between operating income and operating expenses of a company that does not include depreciation expense in companies with more than 50 employees, with a median of HRK 7,671,400 (interquartile range HRK 2,449,900 up to HRK 16,462,775) compared to enterprises with up to 10 employees with an average value of HRK 20,600 (interquartile range -3,600 to HRK 134,100) (Kruskal Wallis test, $p < 0.001$), as well as the difference between operating income and expenses (EBIT) where enterprises with up to 10 employees have an average value of HRK 8,400 (interquartile range -8,400 HRK to 69,100 HRK) compared to those with 11 - 50 employees or with enterprises with more than 50 employees with HRK 3,659,750 (interquartile range 522,225 (Kruskal Wallis test, $p < 0.001$).

Profit before tax (EBT) is significantly higher for companies with more than 50 employees and amounts to HRK 2,694,600 (interquartile range HRK 243,075 to HRK 11,276,550) compared to enterprises with a maximum of 10 shareholders with a median of HRK 7,000 (interquartile range -6.200 kn to 50.000 kn) (Kruskal Wallis test, $p < 0.001$).

The median corporate income tax in companies with more than 50 employees is 70,700 HRK(interquartile range 0 to 518,800 HRK), significantly higher than in companies with 11-50 employees or those with up to 10 employees with a median of 200 HRK (interquartile range 0 kn to 8,300 kn) (Kruskal Wallis test, $p < 0,001$), as well as the net profit itself from 2,153,950

kn (interquartile range from 158,650 kn to 10,892,050 kn) compared to companies with 11-50 employees or with 10 and fewer employees with a median net profit of 5,300 HRK (interquartile range -6,200 HRK to 41,300HRK) (Kruskal Wallis test, p <0.001).

The newly created value is significantly higher in enterprises with more than 50 employees and amounts to 18,550,455HRK (interquartile range 10,937,558 HRK to 39,272,091 HRK), compared to enterprises with 10 or fewer employees with 97,821 HRK (interquartile range 10,892 HRK to 411,947HRK).

Productivity in enterprises with more than 50 employees with a mean value of 121,855.5 (interquartile range 98,296.5 to 174,324.5 kn), significantly higher than in enterprises with 11 - 50 employees and in enterprises with 10 and fewer employees where it amounts to 73,628.5 kn (interquartile range 45.436,75 kn to 111.813,75 kn) (Kruskal Wallis test, p <0.001).

The median value of money is 56,900 HRK (interquartile range 4,825 HRK to 538,325HRK), for enterprises with more than 50 employees it is HRK 1,631,200 (interquartile range 363,550 HRK to 4,291,950HRK) which is significantly higher than for enterprises with 11 - 50 employees or in companies with 10 or fewer employees where it is lower and amounts to 13,900 HRK (interquartile range 900 HRK to 65,200 HRK) (Kruskal Wallis test, p <0.001) (Table 2).

Table 2: Estimation of mean and dispersion of parameters by number of employees (1)

Parameters	Median (interquartile range) by number of employees			P*
	Less than 10 employees	11 – 50 employees	More thn 50 employees	
Credit	8 (4 - 11)	4 (2 - 7)	4 (1 - 7)	<0,001
Number of emploees	1 (0 - 5)	20 (16 - 31)	156,5 (88,75 - 242,75)	<0,001
Average net salary	2.539 (0 - 4051)	4.463 (3481 - 5337,5)	4.988,5 (4.247,25 – 5.724,5)	<0,001
Total revenue	457.200 (71.600 – 1.333.800)	6.863.100 (4.448.600 – 12.766.450)	74.558.450 (42.097.125 – 156.450.325)	<0,001
Total expenses	467.100 (98.800 – 1.315.000)	6.410.500 (4.303.800 – 10.786.400)	63246450 (39.176.675 – 152.342.125)	<0,001
EBITDA	20.600 (-3.600 – 134.100)	649.700 (245.950 – 1.574.750)	7.671.400 (2.449.900 – 16.462.775)	<0,001
EBIT	8400 (-8.400 – 69.100)	324600 (76.750 – 1.149.050)	3629750 (522.225 – 11.603.275)	<0,001
EBT	7.000 (-6.200 – 50.000)	204.900 (49.600 – 818.650)	2.694.600 (243.075 – 11.276.550)	<0,001
Corporate tax	200 (0 – 8.300)	30.400 (4.900 – 132.850)	70.700 (0 – 51.8800)	<0,001
Net profit	5.300 (-6.200 – 41.300)	161.600 (38.250 – 717.500)	2.153.950 (158.650 – 10.892.050)	<0,001
Newly created value	97.821 (10.892 – 411.947)	2.229.885	18.550.455	<0,001

Parameters	Median (interquartile range) by number of employees			P*
	Less than 10 employees	11 – 50 employees	More thn 50 employees	
		(1409780 – 3.585.932)	(10.937.558,25 – 39.272.091,75)

The average export for enterprises with more than 50 employees is 509.265.550 kn (interquartile range from 18.048.900 kn to 106.829.750 kn), which is significantly higher than the enterprises with 11 - 50 employees 103.400 kn (interquartile range from 0 kn to HRK 1,283,200) (Kruskal Wallis test, $p <0,001$), which also applies to imports, which in the case of companies with more than 50 employees are 11,191,700 HRK (interquartile range 2,522,425 HRK to 37,037,750 HRK) in relation to enterprises with 11 - 50 employees with a median import of 10.400 kn (interquartile range 0 kn to 1.283.200 kn) (Kruskal Wallis test, $p <0.001$). In enterprises with more than 50 employees, the total assets / liabilities with a median value of 74,070,900 HRK (interquartile range 47,501,950 HRK to 153,872,900 HRK) are significantly higher than those with 10 or fewer employees, with an average total assets / liabilities HRK 579,300 (interquartile range 149,300 HRK to 1,814,000 HRK) (Kruskal Wallis test, $p <0.001$).

The average value of long term assets of 34,658,450 HRK (interquartile range 20,040,150 HRK to 76,669,625 HRK) is significantly higher for enterprises with more than 50 employees, which is significantly higher than for enterprises with 11 - 50 or 10 and fewer employees with the median value of 89,400 HRK (interquartile range 4,900 HRK to 588,300HRK) (Kruskal Wallis test, $p <0.001$).

Short-term assets are significantly higher in enterprises with more than 50 employees with a median value of 34,658,450 HRK (interquartile range 20,040,150 HRK to 76,669,625 HRK) compared to enterprises with 11 - 50 or 10 and fewer employees with a median value of 332,100 HRK (interquartile range 85,500 HRK to 1,116,600 HRK) (Kruskal Wallis test, $p <0,001$).

Capital and reserves are significantly higher in enterprises with more than 50 employees and amount to 35,270,000 HRK (interquartile range 18,081,225 HRK to 76,561,750 HRK) compared to enterprises with 11 - 50 and 10 or less employees, where the value of the medium equity and reserves of 82,600 HRK (interquartile range -16,500 to 503,600 HRK) (Kruskal Wallis test, $p <0.001$).

The liquidity ratio is significantly higher in companies with 11 - 50 employees and is 1.6 (interquartile range 1.01 to 3.21) compared to enterprises with more than 50 employees where it is 1.49 (interquartile range 1.09 to 2.6) or in companies with 10 or fewer employees where the liquidity ratio is 1.1 (interquartile range 0.54 to 2.02) (Kruskal Wallis test, $p <0.001$).

The Altman Z score is significantly higher in companies with 11 - 50 employees and is 2.18 (interquartile range 1.54 to 3.65) compared to enterprises with more than 50 employees where

it is 2.04 (interquartile range 1.32 to 2.9), or in companies with 10 or fewer employees where the Altman Z score is 1.53 (interquartile range 0.08 to 3.66) (Kruskal Wallis test, p <0.001).

Claims days are significantly higher in companies with up to 10 employees and amount to 89 days (interquartile range 44.75 days to 232 days) compared to enterprises with 11 - 50 employees where the average value is 83 days (interquartile range 45.25 days to 126.25 days) (Kruskal Wallis test, p = 0.014).

The operating margin has a mean of 3.75 (interquartile range -1.34 to 9.75), significantly higher in companies with more than 50 employees, where it is 4.84 (interquartile range 1 to 9.7) while the mean operating margin is in companies with 10 and fewer employees 2.57 (interquartile range -5.78 to 9.29) (Kruskal Wallis test, p = 0.004).

The rate of return on equity (ROE), which is also used as a good indicator of the rate of growth of an enterprise and whose average of 15% is considered good, is slightly higher in enterprises with 11 - 50 employees, where it is 14.4% (interquartile). 1.3% to 35%) compared to enterprises with 10 or fewer employees with an average rate of 6.5% (interquartile range 0% to 38.1%). There is no significant difference in the number of employees in enterprises.

The rate of return on assets (ROA), which is an indicator of the success of using the assets in generating profit, and is also used to evaluate the success of new projects whereby the project will be more profitable if the ROA is greater than the amount of interest rates on loans, is significantly higher in enterprises than 50 employees and is 4.75% (interquartile range 1% to 13.15%) compared to companies with 10 and fewer employees having the lowest rate of 1.5% (interquartile range -2.3% to 7.5%) (Kruskal Wallis test, p <0.001).

The median income per employee of 508,965 HRK (interquartile range 360,378.5 HRK to 679,966.75 HRK) is significantly higher in enterprises with more than 50 employees than in enterprises with 10 or fewer employees with the median income per employee of 257,400 HRK (interquartile range from 135.851 HRK to 436.493 HRK) (Kruskal Wallis test, p <0.001).

The net profit per employee of 18,078,5 HRK (interquartile range 1,691.25 HRK to 57,528 HRK) in enterprises with more than 50 employees is significantly higher than the net profit per employee in enterprises with 11 - 50 employees, where the average value is 9,012 HRK (interquartile range 1,845 RHK to HRK 39,613.5), or in relation to enterprises with 10 or fewer employees where the average net profit per employee is HRK 5,045.5 (interquartile range HRK 51.5 to HRK 20,416.25) (Kruskal Wallis test , p = 0.002) (Table 3)

Table 3: Evaluation of mean and dispersion of parameters by number of employees (2)

Parameters	Median (interquartile range) by number of employees			P*
	Less than 10 employees	11 – 50 employees	More than 50 employees	
Exports	0 (0 - 0)	576.400 (0 – 3.611.100)	50.926.550 (18.048.900 – 106.829.750)	<0,001
Imports	0 (0 - 0)	103.400 (0 - 1283200)	11.191.700 (2522425 - 37037750)	<0,001
Assets / Liabilities	579.300 (149.300 – 1.814.000)	6.319.400 (3.513.500 – 15.624.550)	74.070.900 (47.501.950 – 153.872.900)	<0,001

Parameters	Median (interquartile range) by number of employees			P*
	Less than 10 employees	11 – 50 employees	More than 50 employees	
Long term assests	89.400 (4.900 – 588.300)	2.753.400 (828.050 – 5.967.300)	34.658.450 (20.040.150 – 76.669.625)	<0,001
Current assets	332.100 (85.500 – 1.116.600)	3.520.700 (1.989.700 – 7.722.950)	33.457.900 (20.652.850 – 75.128.675)	<0,001
Capital and reserves	82.600 (-16.500 – 503.600)	2.006.100 (718.300 – 5.753.900)	35.270.000 (18.081.225 – 76.561.750)	<0,001
Liquidity ratio	1,1 (0,54 - 2,02)	1,6 (1,01 - 3,21)	1,49 (1,09 - 2,6)	<0,001
Altman Z score	1,53 (0,08 - 3,66)	2,18 (1,54 - 3,65)	2,04 (1,32 - 2,9)	<0,001
Days of receivables	89 (44,75 - 232)	83 (45,25 - 126,25)	70 (45,25 - 114,75)	0,014
Payables in days	82 (31 - 229)	61 (29 - 117)	67 (44,25 - 103,25)	0,018
Operating margin	2,57 (-5,78 - 9,29)	4,81 (1,39 - 10,74)	4,84 (1 - 9,7)	0,004
ROE	6,5 (0 - 38,1)	14,4 (1,3 - 35)	11,35 (1,35 - 30,05)	0,135
ROA	1,5 (-2,3 - 7,5)	4,4 (1,2 - 13,55)	4,75 (1 - 13,15)	<0,001
Employee income	257.400 (135.851 – 436.493)	312.387 (203.696,5 – 545.147)	508.965 (360.378,5 – 679.966,75)	<0,001
Net profit per employee	5.045,5 (51,5 – 20.416,25)	9.012 (1.845 – 39.613,5)	18.078,5 (1.691,25 – 57.528)	0,002

*Kruskal Wallis test
Source: author

Since the significance for all parameters (except ROE) is less than 0.05, H1.2 is accepted and H1.1 is rejected, that is, there is a statistically significant difference in the observed parameters in relation to the groups of companies by the number of employees. From all of the above it can be concluded that by testing Hypothesis it is confirmed.

5. Conclusion

Continuous market changes are creating a whole new concept of competitiveness called hypercompetitiveness. Each industry, especially deficitarty industry as metalprocessing needs to cope with new trends. The reason is that tradition can't be key elemet for future development. According this paper research was conducted on 508 enterprises in total in the metal processing industry (sectors C24, C25 and C28 according to NKD 2007) from all Croatian counties (21 counties). The main result of research is that there is a statistically significant difference in the observed parameters in relation to the groups of companies by the number of employees. This hypothesis is confirmed by Spearman correlation coefficient which shows connection of the number of employees with observed parameters with 28 parameters.

According to the research, recommendation for further development is that companies, in all their segments, should be focused on increasing of the number of employees, which ultimately will lead to a better market position and better financial results, same as higher level of competitiveness. But number of employeers is only one elemet for overall success, there should be also an education of workers and implementation of new technologies. Also education and new technologies should be main accent for development, because in future new technologies will lead to decreasement of human resources. So, there is great impact of tradition and human capital, but enterprises should be proactive and implement strategy in their long trem and hort term plans. However, it is necessary to apply the strategic models and methods to achieve a competitive position and regional leadership.

USING LOCATION-BASED SOCIAL NETWORKS FOR OPTIMAL PLACEMENT OF TOURIST FACILITIES: ZAGREB CASE STUDY

ABSTRACT

In the last decade, the advance of services and social networks that can store location coordinates and ratings by visitors has had a significant impact on how potential visitors choose their visit destination. The destination can be a landmark, a city, a restaurant, a hotel, etc., and people visiting the destination can be tourists or locals. Also, the data from these services can be used to analyse the location before potential investment in the tourist facility by an investor. Clustering unsupervised machine learning algorithms can be used for that analysis, combining individual municipalities of a city into clusters that have similar properties, making potential investors informed about municipality's properties.

In this paper, the main goal is to propose an optimal placement model based on the available information. A prerequisite for this is the analysis of location-based service that can be used to make decisions about the location of a restaurant or bar, and the amount of information available at these service for the city of Zagreb. The proposed model is based on a k-means algorithm that belongs to unsupervised machine learning algorithms.

The result of the analysis is the list of municipalities in the city of Zagreb divided into clusters with similar properties. The municipalities are divided into six clusters and that division brings objective knowledge to the potential investor. These results can be used as a basis for decision-making or as a test of expert recommendation. The proposed model can be used for other purposes, depending on the area of interest and the amount of data available on the service.

Key words: big data, tourist facility, LBSN, foursquare.

1. Introduction

In 2010, about 300 million smartphones were sold. Since 2015, sales have stopped growing, amounting to about one billion and a half smartphones a year (Holst, 2019). One of the essential components of smartphones is the satellite navigation module. This module uses satellites to provide geospatial positioning and make this information available to a smartphone (longitude, latitude, and altitude). Precision can be from a few centimetres to meters. The most popular and the oldest navigation satellite system is the Global Positioning System (GPS) made and

operated by the United States of America. Its development started in the 1970s and the system was fully operational in 1990s. The Global'naya Navigatsionnaya Sputnikova Sistema (GLONASS) is developed by Russian Federation and it can be used today, as well as the European global navigation satellite system Galileo (Teunissen & Montenbruck, 2017, VII). Chinese global navigation system BeiDou is still in the development phase (Yang, et al., 2019, 7).

Smartphones use one or more satellite navigation systems, which gives them a whole new set of functionality. With the use of data communication with the Internet, satellite navigation can serve to accurately locate users at any time. This capability has enabled the development of a range of services, and among other things have emerged social networks that use users locations. The first ideas about this service came out at the beginning of the century, and the authors recognized the huge potential of social networking and satellite navigation. Goel proposed in 2001 that real-time interactivity between wireless networks and Global Position System have big potential. The author proposed the tool with three-layer structure and these layers are: Personal Filtering, Information Layering and Social Networking (Goel, 2001). Three years later Melinger et al. proposed the first mobile social network called Socialight. It was in the development stage and included the location-based messaging system and other social network features (Melinger, et al., 2004, 1). By the end of the first decade of this century, location-based social networks became widespread. Long et al. published a paper about a first globally popular location-based social network called *Foursquare* and they analysed the reasons for its popularity (Long, et al., 2013, 3362).

In this paper data from location-based social networks will be used for Zagreb municipalities clustering for selection optimal placement of tourist facility. Zagreb is the capital city of Croatia, an European Union country. In the second section of the paper, location-based social networks will be explained. In the third section, unsupervised machine learning algorithms that will be used for clustering will be explained. The fourth section includes data, methodology and results. Finally, discussion and conclusion are in the fifth and sixth section.

2. Location-based social networks

Gordon and Silva defined Location-Based Social Networks (LBSN) as social network sites that include location information into shared contents (Gordon & Silva, 2011, 11). The first Location-Based Social Network was Dodgeball that allows members to send their location with SMS but it has been acquired and discontinued by Google (Krishnamurthy & Pelechrinis, 2013, 132). Location-Based Social Networks usually have two types of location information:
   a) continuous trajectory,
   b) discrete locations.
When LBSN records user continuous trajectory then members of a social network who are allowed can access the location of a user any time. The approach that uses discrete locations is usually controlled by users. When a user decides, he or she can check-in on some interesting location and share this location with other members. Both types of location recording approach have advantages and disadvantages. Discrete location approach has more contextual information but continuous trajectories have more information about the movement. Generally, the check-in concept is used more often than continuous trajectory concept and the check-in concept produces more valuable information (Krishnamurthy & Pelechrinis, 2013, 130).

As mentioned in the Introduction, growth in Location-Based Social Networks usage has been fuelled by the growth of smartphone with a satellite navigation module purchases. LBSN service is most commonly used by users as an app on a smartphone.

Krishnamurthy & Pelechrinis proposed four categories of Location-Based Social Networks:
   a) Location Sharing Services
   b) Location Guides
   c) Business-Oriented LBSNs
   d) Gaming-Oriented LBSNs (Krishnamurthy & Pelechrinis, 2013, 132).

Location Sharing Services category is the simplest and these services came first because of their simplicity. The primary objective of these services is to allow other users to know the real-time location of an active user who shares his/her location. The earliest LBSN belonged to that category.

Location guides category services are more advanced than Location Sharing Services and its primary purpose is to store and share interesting locations. An example from that category is Gowalla, LBSN that was able to provide interest places based on the opinions of other members. Gowalla was acquired by Facebook in 2011 after four years of existence but it has been shut down.

We can say that Business-Oriented LBSNs category is different because their founders had a viable business model from the beginning. LBSNs from that category used the opportunity to exploit collected information about venues to enhancing commerce at such venues. There are lots of such LBSNs and some of them are Foursquare, Yelp and Shopkick. Research in this paper is based on Foursquare LBSN so it will be described in detail. In China there are different LBSNs from Business-Oriented category and of them is Jiepang that is called "Chinese Foursquare" (Chiang, 2012).

The last category that was proposed by Krishnamurthy & Pelechrinis was Gaming-Oriented LBSNs. The authors state that services from that category usually provide smartphone application that is a platform for gaming, location sharing and advertising. Frith analysed games implemented in the Foursquare platform and concluded that some users render locations as digital objects that have to be collected (Krishnamurthy & Pelechrinis, 2013, 133) (Frith, 2013, 249).

2.1. Foursquare

Foursquare Labs Inc. is an American company with headquarter in New York City. It was launched in 2009 but it takes almost a decade for them to start making a profit (Miller, 2017). Co-founders are Dennis Crowley and Naveen Selvadurai. Crowley built the experience on a similar LBSN called Dodgeball that has been sold to Google in 2005 (Gonsalves, 2005).

Their LBSN services can be accessed with different applications and tools. They started with the concept of real-time location sharing and primary store discrete locations with data that users collected on these locations. Their first application for a smartphone was named simply *Foursquare* and it enabled users to share their locations complemented with comments and pictures, with friends. Users could do this on the web or SMS service but the main idea is to do it with a smartphone.

In 2014 Foursquare Labs Inc. launched another application called *Swarm* that included location sharing and social networking. The same year they upgraded main application *Foursquare*, changed its name to *Foursquare City Guide* and removed location sharing and social networking from it. The screens of both can be seen in figure 1 (Summers, 2014).

One of the main features that are available from Foursquare services is the *Places API*. It is a service primarily intended for developers and analysts that can be queried about any place using an HTTP request. It can be used for free but for larger query volumes users have to pay this service. Key features are:

a) "real-time access to over 105 million places available across 190 countries,
b) use custom API endpoints to power geo-tagging, venue search and recommendations,
c) leverage 70+ venue attributes and 900+ categories and
d) create location experiences with access to user-generated tips, tastes & photos."

It has been used for research in this paper (Foursquare Labs Inc., n.d.).

3. Unsupervised machine learning algorithms

Unsupervised machine learning deals with problems where the data is not labelled. Algorithms from that machine learning category simply find similar data points in multi-dimensional space and put them in clusters. Mohammed et al. consider that most important unsupervised machine learning algorithms are:

a) K-means
b) Hidden Markov model
c) Principal component analysis

d) Gaussian mixture model (Mohammed, et al., 2016, 140)

In this paper, the K-means algorithm is used.
K-means algorithm is a well known unsupervised machine learning algorithm proposed by Steinhaus in 1956. (Steinhaus, 1956). The main principle of that algorithm is the principle of least squares. It can be simply explained as grouping data on a finite number of groups with the goal that the sum of the squared deviation of group members from the centre of the group is minimized. It can be defined as:

$$WCSS = \sum_{c_i \in C} \sum_{j=1\ldots d} \sum_{x,y \in c_i} (x_{ij} - y_{ij})^2$$

where WCSS is the abbreviation for a within-cluster sum of squares and the main goal is to minimize it (Kriegel, et al., 2017, 12). This method is an iterative method and it starts with random positions of cluster centres. In each iteration, the central point is updated and it depends on cluster members. Because of a random selection of initial k-means, after every optimisation, we can get different clusters (Mohammed, et al., 2016, 129).

K-means algorithm is often used in scientific papers that deal with data from Location-Based Social Networks. Yang et al. used the k-means algorithm to cluster LBSN users and they propose a cultural mapping approach based on the data from LBSNs (Yang, et al., 2016). Modsching et al. used k-means algorithm to discover tourists activity areas and they found that twenty clusters are the optimal number in their research in the city of Gorlitz in Germany (Modsching, et al., 2008). Claypo and Jaiyen used k-means algorithm for clustering of customer opinions for Thain restaurants into positive and negative groups. They used about one thousand text reviews from website th.tripadvisor.com (Claypo & Jaiyen, 2015). Isanan used k-means algorithm to retrieve restaurant category data on the Philippines and he used data from Foursquare and Google services (Isanan, 2019). In this paper, k-means algorithm implementation from the scikit-learn library is used (Scikit-Learn community, 2020).

4. Zagreb case study

4.1. Data and methodology

Zagreb is the capital city of Republic Croatia and official 2011 census counted almost 800000 residents. In 2011, the city of Zagreb has about 600 000 tourist arrivals but only six years later this number was more than doubled. In 2017 tourist arrivals number was more than 1,3 million (Kesar, et al., 2018, 192). This is recognised by global and regional restaurant and fast food corporations, like Subway and Lars&Sven, and they have opened or announced the opening of their restaurants and fast food outlets (teen385.com, 2019) (Punkufer.hr, 2019).

Table 1: Zagreb municipalities with the area and population data

	Municipalities	Area (km²)	Population (2011)	Population (2001)	Population density (2001)
1.	Donji Grad	3.01	37,123	45,108	14,956.2
2.	Gornji Grad – Medveščak	10.12	31,279	36,384	3,593.5
3.	Trnje	7.37	42,126	45,267	6,146.2

	Municipalities	Area (km²)	Population (2011)	Population (2001)	Population density (2001)
4.	Maksimir	14.35	49,448	49,750	3,467.1
5.	Peščenica – Žitnjak	35.30	56,446	58,283	1,651.3
6.	Novi Zagreb – istok	16.54	59,227	65,301	3,947.1
7.	Novi Zagreb – zapad	62.59	58,025	48,981	782.5
8.	Trešnjevka – sjever	5.83	55,342	55,358	9,498.6
9.	Trešnjevka – jug	9.84	66,595	67,162	6,828.1

Source: Croatian Bureau of Statistics, 2011; Croatian Bureau of Statistics, 2001

One of the most important factors for the success of fast food outlets or restaurant is its location. The main goal of this paper is to provide a method for municipalities clustering in Zagreb that is based on available data on Foursquare LBSN and k-means algorithm. This method is well-known before tourist facility location selection but Zagreb's special feature is the low availability of quantitative data on which decision can be made. Some cities have much more quantitative data available on the government web sites and the good example is Hong Kong with their annually Population and Household Statistics Analysed by District (The Government of the Hong Kong Special Administrative Region, 2019).

The city of Zagreb is divided into seventeen municipalities and they are listed in the table number one. On figure 2, there is a satellite picture with municipalities borders and it can be seen that there are many differences between municipalities in size, position etc.

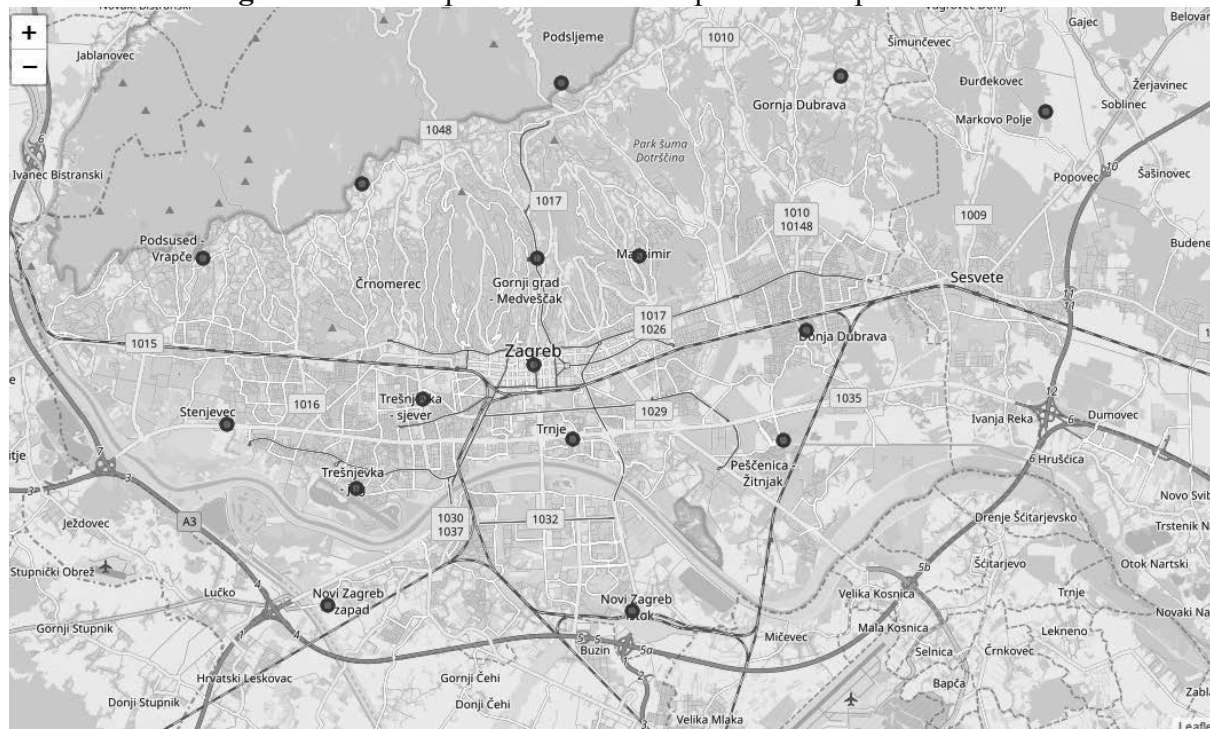
Figure 2: Zagreb satellite picture with municipalities borders
Source: authors

To analyse municipalities in Zagreb, Foursquare API is used (Foursquare Inc., n.d.). Their API enables search for locations based on longitude, latitude, and radius. Due to incomplete information entered into the Foursquare database, the municipality of a particular location is not known. This problem is solved in such a way that each municipality is defined as a polynomial and the polynomial points are stored in files. After that central point of every municipality has been found and this information was used for Foursquare queries. On figure 3, an example of one municipality polygon definition can be seen.

Figure 3: Municipality polygon example

Source: authors

Central points of all municipalities except Brezovica can be seen in figure 4. Brezovica is a big municipality on southwest that cannot be seen without zoom out. This municipality can be seen along the bottom edge of figure 2.

Figure 4: Central points of all municipalities except Brezovica


Source: authors

1084 venues were obtained after the data was withdrawn for all 17 municipalities. After withdrawing, the data were prepared for the k-means algorithm but one of the common questions when using the k-means algorithm is how many clusters we want. There are many methods for that decision available in the literature but we tried with all values between 2 and 10 clusters. Results can be seen in table number 2.

Table 2: Number of municipalities in one cluster

Number of clusters	Number of municipalities in one cluster									
1	17									
2	16	1								
3	15	1	1							
4	14	1	1	1						
5	12	2	1	1	1					
6	6	6	2	1	1	1				
7	6	6	1	1	1	1	1			
8	5	5	2	1	1	1	1	1		
9	4	3	3	2	1	1	1	1	1	
10	4	2	2	2	2	1	1	1	1	1

Source: authors

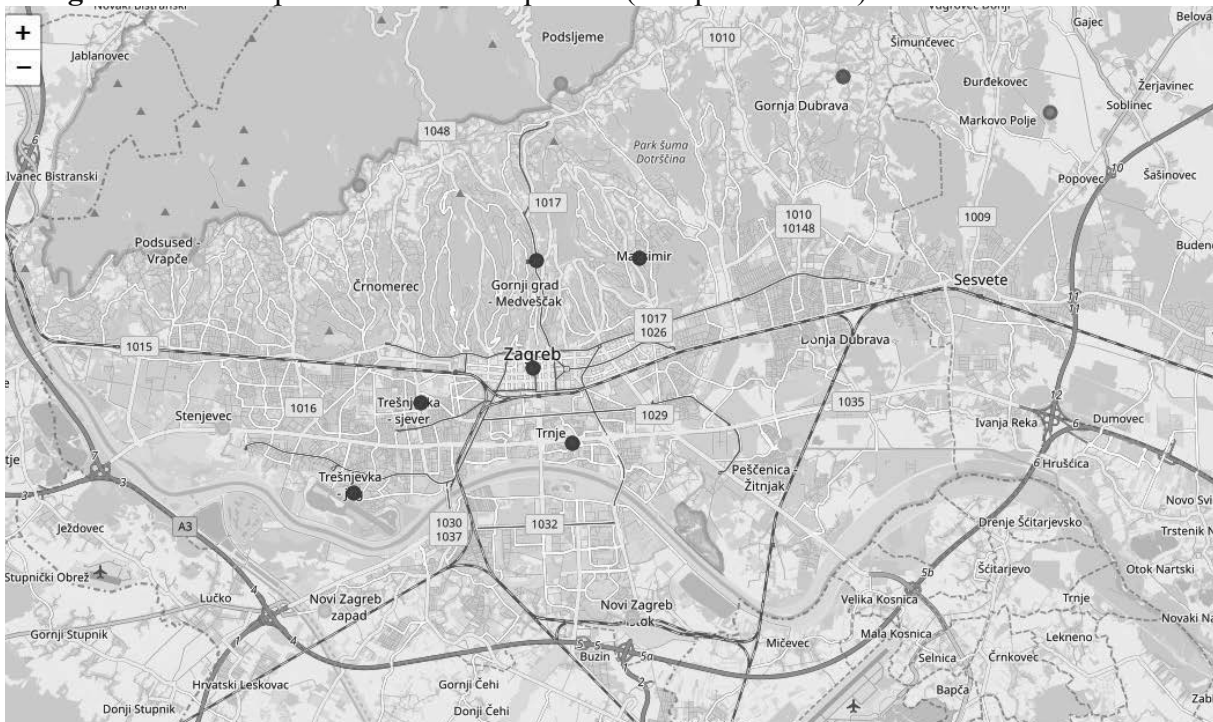
When this data is presented graphically in a way to calculate the standard deviation of the municipality number, we get the graph in figure 5.

Figure 5: The standard deviation of the number of municipalities in a cluster depends on the number of clusters
Source: authors

It is interesting that with six clusters there is a sharp drop in standard deviation so six clusters have been chosen. The whole program in Python can be seen on the Github: https://github.com/kristian1971/RED2020_Zagrebstory.

4.2. Results

On figure 6, sixteen central points of six clusters can be seen but in different colours depends on cluster affiliation of the municipality.

Figure 6: Central points of all municipalities (except Brezovica) divided into six clusters


Source: authors

In table number 3 cluster affiliation of all municipalities can be seen, as well as ten the most common venues in a particular municipality.

Table 3: Ten most common venues for all municipalities

	Municipality	Cluster	1st MCV	2nd MCV	3rd MCV	4th MCV	5th MCV	6th MCV	7th MCV	8th MCV	9th MCV	10th MCV
10	Gornja Dubrava	0	Pizza Place	Grocery Store	Forest	Park	Middle Eastern Rest	Diner	Dessert Shop	Dog Run	Drugstore	Food
0	Donji grad	1	Café	Plaza	Restaurant	Bar	Dessert Shop	Hostel	Theatre	Historic Site	Coffee Shop	Burger Joint
1	Gornji grad	1	Café	Dessert Shop	Bar	Plaza	Mediterranean Rest	Park	Pub	Theatre	Hostel	Bistro
2	Trnje	1	Café	Bar	Restaurant	Plaza	Hotel	Pizza Place	BBQ Joint	Coffee Shop	Eastern European Rest	Dessert Shop
3	Maksimir	1	Café	Bar	Dessert Shop	BBQ Joint	Pizza Place	Theatre	Park	Restaurant	Wine Bar	Bakery
7	Tresnjevka - sjever	1	Café	Bar	BBQ Joint	Plaza	Restaurant	Mediterranean Rest	Dessert Shop	Burger Joint	Gym	Park
8	Tresnjevka - jug	1	Bar	Café	BBQ Joint	Pizza Place	Gym	Dessert Shop	Eastern European Rest	Supermarket	Pub	Restaurant
15	Sesvete	2	Restaurant	Café	Wine Bar	Farm	Flea Market	Fish Market	Field	Fast Food Rest	Farmers Market	Electronics Store
16	Brezovica	3	Playground	Farmers Market	Toll Booth	Farm	Wine Bar	Electronics Store	Flea Market	Fish Market	Field	Fast Food Restauran
4	Pescenica	4	Supermarket	Furniture / Home Store	Restaurant	Café	Bar	Bakery	Grocery Store	Bus Station	Plaza	Chinese Restaurant
5	Novi Zagreb - Istok	4	Café	Supermarket	Bar	Grocery Store	Pet Store	Pizza Place	Restaurant	Wine Bar	Shopping Mall	Coffee Shop
6	Novi Zagreb - Zapad	4	Café	Supermarket	Bar	Pizza Place	Restaurant	Nightclub	Shopping Mall	Beach	BBQ Joint	Dessert Shop
11	Donja Dubrava	4	Café	Supermarket	Bar	Pizza Place	Grocery Store	Clothing Store	BBQ Joint	Restaurant	Shopping Mall	Furniture / Home Store
12	Stenjevec	4	Café	BBQ Joint	Bar	Pizza Place	Grocery Store	Fast Food Rest	Eastern European Rest	Supermarket	Electronics Store	Pub
13	Podsused	4	Café	Bar	Grocery Store	Supermarket	Trail	BBQ Joint	Restaurant	Mediterranean Restaurant	Pizza Place	Bus Station

5. Discussion

Many authors used k-means or another clustering algorithm for urban municipalities analyse. Assem et al. used it to discover spatiotemporal functional regions in one Ney York City district (Assem, et al., 2016). Sun et al. proposed method for the city centres detection with the LGOG cluster method using LBNS data (Sun, et al., 2016). Hong and Jung proposed analytical method of cluster analysis for Foursquare data. They conclude that a qualitative approach for fully interpreting and analysing is important. Objects of their analyse were coffee shops in Seattle (Hong & Jung, 2017).

Our approach was a little bit different because we have started with municipalities and defined central points of every municipality. After that Foursquare service was queried and k-means cluster analyse has been performed on that data. Similar municipalities have been put in the same clusters and we have performed analyse with a different number of clusters.

In the literature three main methods for determining the optimal number of clusters have been suggested: silhouette, elbow and gap statistic methods (Krishna, et al., 2018, 301) (Kassambara, 2018). In this paper, we used the simplified method based on standard deviation values of cluster size and propose this method for such simple examples but this method has to be thoroughly compared with other methods.

Final results with six clusters can be seen in figure 7 and table number 3. The information in the table complements the figure and helps with interpretation. Figure 7 points the municipalities that are primarily intended for residential use and they belong to cluster number 4. Cluster number 1 shows that this is a downtown area dominated by café's, bars and restaurants. There are no supermarkets in that cluster between ten the most common venues in the municipality (only in one case). Other clusters are specific and are mostly municipalities on the outskirts of the city.

Finally, these results can be used by the potential investor because cluster division brings objective knowledge to a potential investor. These results can be used as a basis for decision-making or as a test of expert recommendation. The suggested approach is not new but the main contribution of the paper is in the proposed method that can be used on the occasions when we have low availability of quantitative data.

The proposed model can be compared with other models but it is not easy to compare our results with other papers because we couldn't find any published analyse that deals with Zagreb municipalities and clustering. Some organisations like Croatian Bureau of Statistics have quantitative data and they combined data from different sources but they do did not make these data publicly available. Before two years they merged administratively with spatial data from the Register of Business Entities with the Spatial Statistical Register (Croatian Bureau of Statistics, 2018). Posloncec-Petric et al. also published a paper in which they presented the project "GIS database of census districts according to the 2001 population census". This project includes a database with Registry of business units and spatial information. That database is primarily made for the Zagreb City Office for Strategic Planning and Development and it is not publicly available (Poslončec-Petrić, et al., 2011).

6. Conclusion

The paper indicates that it is possible to use just location-based social network data for basic clustering of city municipalities. The city of Zagreb is not as digitized as it could be by the city government but using the available data from the Foursquare service we can obtain usable objective knowledge. With such basic information, potential investors have a more accurate view of the characteristics and similarities of individual municipalities of the Zagreb city. It is very important for foreign investors that are not familiar with the specifics and structure of individual municipalities.

The presented approach can be improved in several aspects. More information from different sources can be included before clustering, like population density or average population income by municipalities. Another possibility of improvement is to include data from other location-aware services like Google Maps, Yelp or Instagram. Croatian Bureau of Statistics has much more accurate data divided by one square kilometre areas so that data can be also used to improve the model.

Finally, our government must recognize that it is in the general interest to make information about business entities and their density available on public services. The availability of this information may make our country more interesting to potential investors and enable our entrepreneurs to develop business based on new technologies.

DIGITAL TRANSFORMATION OF ACADEMIC SPORTS IN THE ROLE OF RAISING THE QUALITY OF UNIVERSITY EDUCATION – CASE STUDY OF FACULTY OF EDUCATION OSIJEK 2014–2019

ABSTRACT

The purpose of this paper is to provide an analysis of the digital transformation of academic sports with an emphasis on its recognizability among student population. Digital transformation is nowadays present in all segments of social life and is an indispensable factor in all activities that surround us. The quality of academic sports at individual components, as well as the quality of the teaching content in physical and health education, certainly has a major role in raising the general quality of studying at a given academic institution, and, to a certain extent, it can be a factor in attracting future students. The fact that developed countries invest considerable funds in academic sports development indicates that they have recognized their potential and significance both for the academic community and the society as a whole. The paper addresses the recognizability of student sport among students themselves, the ways students obtain information on student sporting activities and the extent to which they are familiar with the activities both at faculty and university levels. A survey was conducted among the students of the Faculty of Education of the Josip Juraj Strossmayer University of Osijek. The data obtained by the survey provide answers to questions related to concrete ways of informing the students on academic sports and the extent in which academic sports follow the trends of the digital transformation which has been happening in the entire society. What makes this paper interesting is a comparison of insights over a five-year period, given that the survey was conducted on the same sample (the same number of students per year of study) in 2014 and then again 5 years later. The results precisely show the intensity of certain changes in student population behavior when it comes to academic sports.

Key words: academic sports, digital transformation, internet, digital tools, sports management.

1. Introduction

Academic sport has been experiencing an expansion in multiple directions in the Republic of Croatia over the past several years. This paper will not look into the athletic context of academic sport, but rather highlight its organizational component in the context of developing and improving the quality of university education. The spectrum of activities that academic sport encompasses can in many segments have an impact on the quality of university education, but also on the quality of the entire community. Many developed countries have recognized its importance and are paying increasing attention to it. In the Republic of Croatia, academic sport is leaving the shadow of the academic community and its educational context. The growing profile of academic sport is boosted by a number of marketing activities focused both on students and the public in general. Given the fact that the society is in the process of digital transformation, which we can see all around us, sport is going through its own digital transformation phases. In certain cases, the educational system has recognized the positive effects of digital transformation, for instance it has fully digitized student record books as valid documents. Digital transformation has enabled remote education with digital tools and online learning. In addition, the digital transformation of marketing activities has allowed every higher education institution to open up to the global market and thereby the global competition to attract students. Academic sport plays a certain role in all of the above. The digital transformation of academic sport brings positive effects, it becomes more popular and recognizable among students, and in certain cases it is also a decision-making factor for future students when choosing a university.

This paper will make a comparison of students' preferences between points in time to determine whether and to what extent has their perception of academic sport changed. The research should also provide answers on possible changes to provision of information on academic sport and the efficiency of digital tools with respect to student population. The first survey was carried out in 2014, whereas the new survey was carried out in 2020. The time difference of 6 years is a sufficient distance to determine any changes and predict future trends. Both surveys were carried out in the same manner and on the same size and structure of student population in order to maximize the comparability of obtained data. The result obtained in this research can be an indicator to people in academic sport as to what students perceive as good or bad, and to what extent have positive or negative changes occurred over the six-year period.

2. Theoretical Framework

2.1. University sport as an example of amateur sport and a carrier of the fundamental principles of the Olympic Charter

The document that modern sport is largely based on is the Olympic Charter by Pierre de Coubertin – the father of the modern Olympic Games – whose first paragraph of the fundamental principles says: "[…] Blending sport with culture and education, Olympism seeks to create a way of life based on the joy of effort, the educational value of good example, social responsibility and respect for universal fundamental ethical principles" (Olympic Charter, 2017:10). In doing so, it is important to emphasize that the Charter understood Olympism as an exclusively amateur movement with no right of participation and sometimes with harsh sanctions for those who would get monetary compensation in exchange for their participation (e.g. Jim Thorpe's gold Olympic medals from the 1912 Olympic Games were taken away from him after it was discovered that he

made money in a half-professional baseball league before participation in the Games (Levinson, 1999: 401). Even at the time of Avery Brundage's presiding over the International Olympic Committee (1952-1972), they preserved consistency of "non-contamination of sport with politics and defense of the Olympic movement against the evil of commercialism" (Levinson, 1999: 281). However, during the mandate of Juan Antonio Samaranch (1980-2001), professional athletes were allowed to participate in the Games, which enabled the organization of spectacular Games in Barcelona in 1992 (e.g. the US basketball Dream Team) and commercial changes which would later take place (Levinson, 1999: 284). Taking into account the historical bond between media and sport, commercial requirements and the links as well as the consequential transformation of sport in professional direction – the question remains about the contemporary presence and media representation of amateur sport as a kind of a carrier of the fundamental principles of the Olympic Charter.

One of the areas where sport, with a relatively high quality of performance, has remained amateur (along with its different directions of application in numerous countries) – is academic or university sport. The reason for that is, according to Caplan (2017:19), the fact that amateur distinction exists in order to ensure the prioritizing of obligations of student athletes toward education, while sport is envisaged as a tool for increasing the social component of education and healthy lifestyle. The ability of university sport to provide a quality sports performance and draw media attention, despite being amateur, is confirmed by large and worldwide established events, such as one of the most famous rowing regattas in the world, the one between the Oxford University and the Cambridge University on the river Thames, and the World University Games ("Universiade") under the patronage of FISU (Fédération Internationale du Sport Universitaire /International University Sports Federation), or virtually the entire system of the United States' university sport (NCAA – National Collegiate Athletic Association).

However, university sport has not everywhere developed or became established in the same way, but all over Europe, Croatia included, it is gradually changing and starting to take its place on the sports, social and media stages.

2.2. The System of University Sport in the Republic of Croatia

The topic of university sport has recently become very popular for the Croatian circumstances taken into account that in 2016 Croatia hosted the largest multi-sports event since it became an independent country – the European University Games Zagreb – Rijeka 2016, which marked the beginning of a new period of development for the Croatian university sport. The third edition of this event, whose competent authority is the European University Sports Association (EUSA), took place from 13 July to 25 July 2016, and there were more than 5 thousand contestants in 21 sport from 45 European countries. Taken into account that it was the largest multi-sports event hosted in Croatia since it became an independent country, its organization attracted large media interest, and university sport was broadcast live on public television for the first time since the Summer Universiade 1987 in Zagreb.

The system of university sport in the Republic of Croatia is organized according to the Sports Act, which presupposes that "in order to perform sports activities […] students' sports associations are founded at higher education institutions" (Sports Act, Article 56 paragraph 1). The vertical of the organizational hierarchy from the lowest, faculty level, which deals with physical education and participation of sports teams at intercollegiate competitions within a university, presupposes that "student sport associations operating within one higher education institution associate into a

student sports federation which establishes and manages the system of sports competitions within higher education institutions." (Sports Act, Article 57 paragraph 1). Accordingly, for example, at the level of the city of Zagreb and all higher education institutions and faculties within the University of Zagreb, sports competitions and the system of university sport is under the purview of University Sports Federation Zagreb, in Split under the University Sports Federation Split, in Rijeka under the University Sports Federation Rijeka and in Osijek under the Student Sport Federation of Josip Juraj Strossmayer University. All of the mentioned student sport federations, including ones in other Croatian cities – centers of higher education institutions (Zadar, Dubrovnik, Varaždin, Vukovar, Slavonski Brod, Požega, etc.), according to the Sports Act "[...] in order to coordinate activities of its members, the organization of competitions and care about the status of students athletes are joined in the Croatian Academic Sports Federation with the status of a national sports federation." (Sports Act, Article 57 paragraph 2). The national academic sports federation, aside from annual national championship competitions for representatives of each higher education institution, "[…] takes part in international student sport movements and joins the appropriate international student sport associations, takes care of preparations and participation in Universiades, world, European and similar student championships and games and takes part in their organization" (Sports Act, Article 57(5)). Accordingly, HASS (Croatian Academic Sports Federation) is a member of the European University Sports Federation (EUSA) and International University Sports Federation (FISU).

The system of university sport in the Republic of Croatia, whose carrier is the Croatian Academic Sports Federation on national level, and its constituents on local level, has been unified since 2014 under the brand UniSport, a compound that represents a kind of a synonym for university sport (*UNIversity Sport*), just like in some other countries in the world (e.g. UniSport Austria, UniSport Australia etc.). Accordingly, in its external communication and its communicational channels the Croatian umbrella university federation communicates its messages as UniSport Croatia or UniSport HR, while in the case of local constituents this suffix changes accordingly to the established abbreviation for the city in which the federation operates, that is, UniSport for Zagreb ZG, UniSport ST for Split, UniSport RI for Rijeka and UniSport OS for Osijek.

2.3. The Role of Communication and Media Activities in Sports Organization

According to Nicholson (2007:10), the media have transformed sport "from search for amateurism into a hyper-commercialized industry", and when we take a look at sport through the prism of marketing and media, we should not neglect the role of advertising in this process, because, according to Bertrand (2007:19), "media are the vectors of commercial", so the special kind of "symbiosis" of these two branches of sport is not surprising. Namely, the advertising industry, according to Pedersen et al. (2007:241), has given the best examples of its creativity in the context of sport, associating the healthy lifestyle that sport promotes with its complete opposites, for instance by advertising fast food chains products, alcohol and soft drinks and other products which have over time become indispensable decor of different sport competitions. The media interest for sport goes back to the very beginning of its development, and the interest of media specialized for sport exists for all branches of sport – mass multi-sports and sports events, professional team sports, sports for people with disabilities, school and university sports. One must not neglect the role of the organizer of a sports event in the facilitation of the communication process and in enabling information to reach the service end user or wide audience – via own communication channels, mass media and public relations or all of those means. The range of organizational

activities of a media system in a sports organization is quite wide, and they depend on the size of the sports organization, but, according to Whannel (1992), we can generally talk about the construction of one's own communication channels, from preparing a communication strategy and media plan, PR activities and other promotional activities, establishing media partnerships, to planning live broadcasts. The above mentioned can be supplemented with other activities mentioned by Milne (2016), such as establishing a press center, training volunteers, defining media positions at sports venues etc., of course, in accordance with the needs and size of an organization. In each case, good planning and implementation of media strategy ignores none of the various promotion areas, and a timely and qualitative construction of one's own communication channels as well as developing a relation with the media are key for constant building and maintenance of organization's positive reputation. Media activities in sports organizations serve equally to build a brand, satisfy needs of sponsors and advertisers, as well as to communicate own messages concerning the organization itself or an event. In this process, the convergence of media content (Dwyer, 2010) and adaptation to market and audience requirements are essential, because, in the communicational sense, event organizers need to communicate through an unprecedented number of platforms, especially today in the age of social media, and to convey their message in the form of a text, word and picture – at the same time adjusted to the audience targeted via a given communication channel. The current informational reality is emphasizing the role of audience, and communication in public space with this same audience gives the opportunity of feedback and multi-direction communication, and thus, as Billings claims (2014:10), taking into account the change of the concept of "audience" and the arrival of new technologies, there are also new communication requirements. Through a spectrum of communication channels that is wider than ever before, the audience is at the very in the heart of the communication process as the creator and the recipient of the message – whether we are talking about content commenting, performance rating or the audience's need to enjoy the information standard existing in some other (sports) organizations of the same kind.

Because sport in general, maybe more than ever before, is nowadays seen as a booming business, becoming an industry with huge sums of money invested, it is important to organize the media system within each sports organization well and to plan out and control the entire communication process, where the role of professionals with competences in media and communication, public relations, advertising and marketing, who handle such tasks, is crucial.

3. Research

Sample of respondents
The sample of respondents consisted of 182 students divided into two subsamples. Of that number, 91 students (31 2nd year students and 60 3rd year students) were surveyed in 2014, and 91 students (31 2nd year students and 60 3rd students) were surveyed in 2020.

Variables
The variables consisted of 20 elements of a survey questionnaire on attitudes of students toward student sport and kinesiology classes at Josip Juraj Strossmayer University in Osijek. The variables has been divided in three categories:
1. According to the importance of an event attracting participants to sport events;
2. According to the quality of organization and satisfaction of personal interests;
3. According to the distinctiveness and availability of information on sport events at the University.

Methods of data processing

Data was collected by means of conducting a survey available to the students in offline and online versions. The study was conducted in April 2014 and in February 2020. Basic descriptive parameters were calculated (arithmetic mean, standard deviation, mode, frequency and percentage of mode, minimal and maximal result) for each survey element for both groups of participants. In order to establish differences between the two generations of students, the t-test for independent samples was used with the confidence level $p=0.05$.

4. Results from 2014

The results of the questions asked in the 2014 survey will be presented further, and the next chapter deals with the results of the survey carried out in 2020.

Table 1: Basic descriptive parameters of the sample measured in 2014 for the variable of importance of events at the University

What do you find important and to which extent for you to visit some of the intercollegiate sport competitions?							
	2014						
	Mean	SD	Min	Max	Mode	f Mode	% Mode
participation of my faculty/department	4,86	1,94	1	7	7	26	26,57

To which extent do you agree with the following statements? [I know when sport competitions at my faculty take place	2,69	3,42	-2,67	0,01*
I am familiar with achievements of my university at national level	1,89	2,75	-3,69	0,00*
I am familiar with achievements of my university at international level	1,76	2,40	-2,98	0,00*
If I had an opportunity to engage in a sport I like, I would attend physical education regularly	5,51	5,33	0,68	0,50
If I knew when and where students' competitions take place, I would attend them	4,00	4,52	-1,97	0,05

*p=0.05
Source: authors

The results show the obvious impact of digital transformation on informing students about sports activities. For all variables that show statistically significant differences, results of students in 2020 have higher values. That way they evaluate the organization of kinesiology classes and extracurricular activities which take place at their faculties/department. They also evaluate distinctiveness of sport activities at the University better and are better informed than their colleagues in 2014 were, which is confirmed by their statements on being familiar with sports in which students of their faculty/department take part, as well as with scheduled times of competitions. They are also better informed about the University's sport at national and international levels.

5. Conclusion

The theoretical part of this study presented the importance of academic sport in the academic community, but also in the society in general, which emphasizes how important it is to provide students with high quality and timely information on student sport activities. Media activities and a structured approach to those activities are extremely important for promotion of student sport, and subsequently studying itself. For many students choosing a university program, the content offered for their free time is very important, because recreational and sport activities play an important role. Awareness of students about sport activities is evidently increasing, which boosts

their interest for watching academic sport. Media activities in particular should enable students to involve in sport activities easier, which, by means of the social component of sports, can highly impact the quality of their studying. It is extremely important to mention that participation in sports activities on the student level does not only mean doing sports, but also involvement in supporter activities which affect the quality of university education by means of providing a sense of belonging to a specific group or community.

The research showed that the level of awareness among students in 2020 is higher than among students in 2014, thanks to digital transformation of academic sport. Informing students by means of website updates, social media and other digital tools could be a way to encourage students to involve not only in extracurricular activities taking place at their faculties but also in competition activities at university and even national levels. The approach to digital transformation of primarily media, but also of the management component of the student sport itself can affect its quality and quantity increase, which will surely result with a higher quality university education. Since this study has been conducted at the level of only one constituent of Josip Juraj Strossmayer University in Osijek, namely the Faculty of Education, further studies should encompass all constituents of the University. It would be highly interesting in the future to get an overview of these data at the national level, which would enable comparison of media activity of academic sports depending on each higher education institution.

THE INTERNATIONAL COMPETITIVENESS OF THE EU AUTOMOTIVE INDUSTRY[1]

ABSTRACT

The automotive industry represents one of the most important contributors to the economy of the European Union (EU). Besides providing employment, car production industry might be essential contributor to foreign trade balance for especially major car producers like Germany, France and other EU Member States. The EU is also positioned as the world's leading producer of motor vehicles. In year 2019, the EU car producers are facing serious challenges. Slower growth of EU industrial production, decreased passenger car production and passenger car registrations, decline in car demand, strict environmental standards and the EU legislative, production restructuring, stronger rivalry proved to impact on the competitiveness of the EU car industry. The main goal of this research is to identify international competitiveness of major car producers (countries) of the EU. The methodology consists of the implementation of chosen international trade indicators of car producers from selected EU Member Countries. The conclusion refers in confirming current international competitiveness of the EU automotive industry and its perspective. The recommendations and proposals are given based on the results of research.

Key words: *the EU automotive industry, competitiveness, export competitiveness, tourism, analysis.*

1. Introduction

The European Union (EU) automotive industry is the world's leading industry in producing motor vehicles. The EU automotive industry is undoubtedly one of the leading contributors to the EU economy. Moreover, EU automotive industry remains as the largest provider of employment to people in Europe (Invest in EU, 2020).

---

[1] Research has been fully supported by the University of Rijeka under the project number uniri-drustv-18-16.

In details, EU automotive industry provides direct and indirect jobs to 13.8 million European citizens, representing 6.1% of total EU employment. Approximately 2.6 million employees ae involved in direct manufacturing of motor vehicles, representing 8.5 % of EU employment in manufacturing (European Commission, 2020).

The EU automotive industry characterizes highly skilled labour, innovation. Moreover, the EU automotive industry stays as a largest exporter industry of Europe with trade surplus. Over half of all automotive patents were granted to the EU industry in 2018, while generating a €84.4 billion trade surplus for the EU (ACEA, 2020). In addition, Germany is the largest EU car exporter (€ 70 billion, 55 % of total) in 2018. (EUROSTAT, 2020)

In most EU member countries, the automobile industry stands for large industry which contributes greatly to the country's exports, GDP and the overall economy. Moreover, the automotive sector has high level interdependence with other upstream sectors such as steel, chemical, and textile industry. The EU automotive industry is cooperating with downstream industries such as ICT, repair, and mobility services industry (European Commission, 2020).

In the context of the defined research problem, the basic scientific hypothesis of the paper is set up, namely, that it is possible to estimate current state of international competitiveness of the EU automotive industry countries by using common and recognized competitiveness indicators. This paper includes the implementation of commonly used Revealed Comparative Advantages index (RCA index), export import ratio and trade balance indicator.

In this relation, the basic objective of the research is to measure international competitiveness, objectively estimate international trade of the automotive industry in European countries, and to propose measures and activities for improvement of international competitiveness of the EU automotive industry in accordance with the results.

The paper consists of four systematically interconnected sections. After the Introduction, the second part of the paper presents theoretical aspects for measuring competitiveness and previous research. Research methodology incorporated in the third part of the paper. The fourth part implies analytical framework and results of international competitiveness of the EU automotive industry. The final part comprises proposals, recommendations and conclusions.

2. Previous research

Competitiveness can been seen from several perspectives. Competitiveness can be taken depending about the level; micro, meso, and macro levels. Micro-level competitiveness exists at the firm level and is "the ability to produce products/services that people will purchase over those of competitors" (Wijnands et.al., 2008; Nagy J. & Jámbor Z., 2018).

The meaning of competitiveness at the micro-level is quite closely connected to the creation of dual value; a process that includes both the consumer's and the owner's value (Nagy J., Jámbor Z., 2018). Meso-level competitiveness is mainly related to competitiveness of a region. According to Kitson, Martin, and Tyler (2004, p.992), "regional (and urban) competitiveness might be defined as the success with which regions and cities compete with one another in some way". Gorton, Hubbard, and Fertő (2013, p.4) describe regional competitiveness as "the ability to offer an attractive and sustainable environment for firms and residents to live and work".

Meso-level competitiveness is positioned between micro- and macro-level competitiveness and cannot be taken as the aggregation of several firms in a given area, but is a more complex phenomenon. Macro-level competitiveness, or national competitiveness, is "the capability of a national economy to operate ensuring the increasing welfare of its citizens and the sustainable growth of its factor productivity. This capability is realized through maintaining an environment for its companies and other institutions to create, utilize and sell goods and services meeting the requirements of global competition and changing social norms" (Chikán 2008b, p. 25; Nagy J., Jámbor Z., 2018). According to Gerasymchuk and Sakalosh (2007), the economy competitiveness on the basis of systems approach is defined by indexes: profitability, medium explicit costs, factors productivity, growth of factors productivity (microlevel); the indexes of enterprises aggregate competitiveness (mesolevel); the profits per capita, the balance of current account of trade balance, world market segment value, hi-tech products share in the general export (macrolevel); the indexes of institutional organizations, social and cultural values (metalevel).

The idea of competitiveness discussed by Hindls et al. (2003), who call a particular economic subject competitive if it is successful in penetrating the new markets and gaining a comparative advantage in international trade. DTI (DTI, 1994) discusses about company's competitiveness as a possibility for production of corresponding goods and services, at the right time, with the right price. OECD (1992) from the micro aspect defines competitiveness that refers to companies' ability to compete, to maximize profit and realize growth based on costs and prices by using technology, improving quality and maximizing the effect of its products.

The problems of international competitiveness have been studied by many famous scientists and practices. But there is no unified essence understanding of this term (Gerasymchuk and Sakalosh, 2007). Country competitiveness is competitive industrial production of goods and services that advantaged foreign analogues on domestic and international markets. The estimation of economy competitiveness consists of two basic approaches: relative costs results of production and production required present resources.

The export competitiveness with special focus on RCA was discussed within several studies. Spatz and Nunnenkamp (2002) investigated RCA of Germany, Japan, and US as leading automotive manufacturing countries globally, and conclude that globalisation negatively affected the comparative advantage of these countries, especially of the US.

Bekmez & Komut (2006) measured the competitiveness of Turkish automotive industry and compares the results with those of the EU member countries from 1995 to 2004. As measurement tool, authors have used RCA index. The results implied that Turkish automotive industry shows very high improvements even though last two years the index is lessened in some extent. With this good improvement. However, the sector still has some problems to be dealt with countries.

Nur Cinicioglu E et. al. (2012) investigated the relations between the factors that enable national competitive advantage and the establishment of competitive superiority in Turkish automotive industry. Authors used RCA index in their comprehensive analytical model and concluded that technological developments in automotive industry can alter the nature of competition in this industry.

Vošta & Kocourek (2017) used standard methods of statistical analysis of indices of revealed symmetrical comparative advantage (RSCA) to detect the trends characterizing the shape and long -term development of the automobile industry in Europe. Authors investigated 39

countries for the period between 1995 – 2015 for each of the three NACE groups (NACE 29.1, NACE 29.2, and NACE 29.3). The authors emphasized the substantial shift s in production and exports from traditional Western European carmakers in favor of the new EU member states, but also from the USA and Canada in favor of new, fast -growing developing countries in the South and Southeast Asia and in Latin America.

Based on the implementation of RCA indexes, Hudakova (2016) analyzed trade competitiveness of the automotive industry in the Slovak Republic over a period 2010-2015. Author concluded that Slovak Republic has a comparative advantage in production of motor vehicles. Nagy & Jámbor (2018) discussed the RCA of global automobile trade for global automobile exports at HS6 level for 1997-2016. Authors pointed out that the calculation of Balassa indices showed that Spain and Japan had highest comparative advantages in all periods analyzed among the most important automobile exporters in the world.

3. Methodology

The methodological approach based on scientific results of RCA (Revealed Comparative Advantages) index which measure the level of international trade competitiveness of the EU automotive industry). In details, 28 EU Member States were analyzed for the period between year 2013 and 2018.

The subject of analysis is Road vehicles including air-cushion vehicles group (number 78, SITC- Standard International Trade Classification, Rev.4) and its major branches 781, 782, 783, 784, 785, 786.[2] Each one of the branches are analysed using Revealed Comparative Advantages (RCA) Index.

One of the frequently used indices is the RCA Index. The concept of comparative advantage is grounded in conventional trade theory and is widely used in modern economic literature to evaluate the patterns of trade and specialization of countries in commodities which have a competitive advantage (Tripa et.al., 2016). Balassa proposes that values of export performance be used for discovering comparative advantages of a certain economy except for factors of manufacturing costs (Balassa, 1965:93). In his further research, Balassa (1986) limited his analysis to manufactured goods only, as distortions in primary products, such as subsidies, quotas and special arrangements would not reflect the real comparative advantage. RCA index represent post trade relative prices and a prevailing factor as well as product market distortions. The Balassa's RCA Index has been criticized for its weak empirical distribution characteristics (De Benedictis & Tamberi, 2004) and for taking only the exports into consideration while disregarding the imports (Cai & Leung, 2008).

The Revealed Comparative Advantage Index (RCA) was calculated according to the following equation (Balassa, 1978:203):

---

[2] Branch 781 represents Motor cars and other motor vehicles principally designed for the transport of persons (other than motor vehicles for the transport of ten or more persons, including the driver), including station-wagons and racing cars; Branch 782 - Motor vehicles for the transport of goods and special-purpose motor vehicles; Branch 783 - Road motor vehicles, n.e.s.; Branch 784 includes parts and accessories of the motor vehicles of groups 722, 781, 782 and 783; Branch 785 - Motor cycles (including mopeds) and cycles, motorized and non-motirized; invalid carriages; Branch 786 - Trailers and semi-trailers; other vehicles, not mechanically-propelled; specially designed and equipped transport containers. More information on Comtrade (2020) https://comtrade.un.org/db/mr/rfCommoditiesList.aspx?px=S4&cc=78

$$RCA_{Ai} = \frac{\frac{X_{Ai}}{\sum_{j \in P} X_{Aj}}}{\frac{X_{wi}}{\sum_{j \in P} X_{wj}}} \geq 1$$

wherein:

P is the set of all products (with $i \in P$),
X_{Ai} is the country A's exports of product i,
X_{wi} is the worlds's exports of product I,
$\Sigma_{j \in P} X_{Aj}$ is the country A's total exports (of all products j in P), and
$\Sigma_{j \in P} X_{wj}$ is the world's total exports (of all products j in P).

The RCA Index measures comparative advantage in the exports of goods «i» of the country «j». If the value is greater than 1, the analysed country has revealed comparative advantages in the exports of goods. Inversely, if the value is less than one, then there is evident lack of comparative advantages in exports of the specific goods. The RCA Index is implemented to present the state of economy along with the expansion of certain products that have market potential. In addition, an insight in the perspective and potential of foreign trade is gained. Countries with similar RCA profiles have highly intensive bilateral trade except for inclusion of intra-industry trade (Bezić and Galović, 2014). On the other side, it is argued that the RCA index is biased due to the omission of imports especially when country-size is important (Greenaway and Milner, 1993).

An improvement of a nation export-import ratio benefits that country in the sense that it can have more export than its value of imports. Moreover, export import ratio and trade balance indicator are used to measure international competitiveness of the EU automotive industry. These indicators refer to total export, import activity and trade balance of the 28 EU Member States from year 2013 to year 2018.

"Export import ratio" indicator shows exports as a percentage of imports. Export- import ratio represents not alternative but complement to trade balance indicator given that one can improve and the other deteriorate at the same time. EXIM ratio can be calculated as follows:

$$EXIM_i = \frac{expo_i}{impo_i} \times 100$$

wherein:
$expo_i$ - export activity of sector "i"
$impo_i$ - import activity of sector "i"

Hence, this indicator (TBAL) is calculated in real numbers of national currencies and highlights the trade pattern of each industry. It can be seen in the following equation:

$$TBAL_i = expo_i - impo_i$$

Trade balance is one of the macroeconomic indicators, which are used to gauge the competitiveness of a sector at national level. When exports exceed imports, the balance is in surplus, and when imports exceed exports, the balance is in deficit (Bezić and Galović, 2013).

All data is derived from UNCTAD Statistical Database (2020) and Eurostat Database (2020).The aim of implemented methodology shows the importance of the international

competitiveness EU automotive industry with special accent on Revealed Comparative Advantages (RCA) analysis.

4. Results

The analysis starts with identification of revealed comparative advantages (RCA) and international competitiveness of the automotive industry of 28 EU countries[3] in the period between 2013 and 2018. Each subsector of the EU automotive industry is investigated within following section. Following Table 1 indicates RCA of subsector 781 of the EU automotive industry.

Table 1: Revealed Comparative advantages of motor vehicles for the transport of persons [781]

---

[3] EU28 countries includes Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania , Slovakia, Slovenia, Spain, Sweden and United Kingdom.

New passenger car registrations in the EU increased to 15.2 million in 2017. That number is about the same as in the years 2001–2007, before the economic crisis that hit new car sales in Southern European countries particularly hard. Registrations in the EU are dominated by Germany, France, United Kingdom (ICCT, 2020). In year 2018, the branch of motor vehicles for the transport of persons recorded the highest export, import activity and trade balance among all investigated branches (Eurostat Database, 2020). Results from Table 1 show highest revealed comparative advantages of Branch 781 in case of Slovakia, Czech Republic, Germany, Spain, Hungary, Slovenia, United Kingdom. It must be added that RCA index of Slovakian automotive industry is more than double than previously mentioned countries. The lack of RCA is evident for automotive industries (Branch 781) of Cyprus, Ireland, Malta, Greece, Bulgaria and Croatia. These results seem very logically because the economy of Malta, Greece, Cyprus, Croatia is mainly based on service sector while Irish economy depends on the performance high-tech industry like IT and pharmaceuticals. Following Table 2 shows RCA of of motor vehicles for transport of goods and for special purpose.

Table 2: Revealed Comparative Advantages of motor vehicles for transport of goods, special purpose [782]

Source: UNCTAD statistical database, 2020

On the average, the highest level of revealed comparative advantages was recorded in the case of Spain, Austria, Portugal and France. The lack of RCA is evident for automotive industry (branch 782) for Greece, Ireland, Malta, Slovenia. Germany, France and Slovakia have quite volatile trend of RCA through observed period. It needs to be stated that Branch 782 of the EU automotive industry is characterized by the third place by its export and import activity and trade surplus in year 2018. Table 3 explains RCA for the road motor vehicles, n.e.s. under the Branch 783.

Table 3 indicates the relevance of Swedish, Dutch, Polish, Belgic automotive industry in road motor vehicles production. Moreover, these countries reached the highest RCA in general. In average, Malta, Ireland, Cyprus and Greece recorded minimal RCA. In year 2018, branch 783 exported 6,3 billion EUR, imported 2,6 billion EUR with trade surplus of 3,6 billion EUR (Eurostat database, 2020). Table 4 analyzes branch 784 which consists of parts & accessories

of vehicles of Branches 722[4], 781, 782, 783 of the EU automotive industry from year 2013 to year 2018.

In year 2018 branch 784 exported 48,4 billion EUR, imported 23,9 billion EUR of parts and accessories of vehicles with a trade surplus of 24,5 billion EUR (Eurostat database, 2020)**.** The highest level of RCA for branch 784 of EU automotive industry could be found in the case of Romania, Czechia, Slovakia and Poland with result of minimum 3,1 and above. These countries are car producers for big car companies like Renault (Dacia), Volkswagen, Hyundai etc. The lack of RCA was recorded in Cyprus, Ireland, Greece and Malta. We have already stated that these countries are service-oriented economies with confirmed lack of RCA. Large car exporters like Germany ranks 8th, Spain 9th, France 11th and Italy 10th on total RCA scale. These countries are characterized by revealed comparative advantages but still not so

Austria, Bulgaria and Italy represent group of EU countries with highest RCA. Austrian companies produce famous brands like KTM, Puch, Rotax, Husaberg while Italians are famous by Ducati, Aprilia, Benelli, Moto Guzzi, MV Agusta, Malagutti, etc. Bulgaria represent important manufacturer of bicycles and e-bikes for the EU market. The total production value in 2016 is estimated at over €136 million of which €15 million was generated by the production of e-bikes. Moreover, the Bulgarian Association of Bicycle Producers has recorded an increase of sales from 53,000 units in 2015 to almost 79,000 units in 2016 at a total market value of €10 million (Bike-EU, 2020). The lack of revealed comparative advantages was recorded Ireland, Cyprus, Malta and Finland. Germany, Spain and Italy rank 10th, 11th and 13th on the RCA scale with better RCA position than Poland, Slovakia and United Kingdom. Following Table 6 shows RCA for Trailers & semi-trailers for the period between 2013 and 2018.

Table 6: Revealed Comparative Advantages of trailers & semi-trailers [786]

In Figure 6 Estonia, Lithuania, Hungary proved to be countries with the highest level of revealed comparative advantages in branch 786 of EU automotive industry. Germany's RCA is positioned on 6th place, right after Poland. Germany represents the largest trailer producer in the EU. One of the characteristics is that most of its production is marketed internationally, making it the only net exporter of trailers in the EU. Furthermore, Germany is home to the three largest semi-trailer manufacturers in Europe- Schmitz Cargobull, Krone, and Kögel (ICCT (a), 2020). Poland is on the 5th place by its RCA. Polish manufacturer Wielton accounts for more than 60% of the country's production. Why are Estonia and Lithuania on the RCA top? German Schmitz Cargobull has production facilities in Lithuania while in Estonia the production value of the motor vehicle, trailer and semi-trailer industry came to approximately 316.2 million euros in year 2015 (Statista, 2020). Trailer and semi-trailers industry in Estonia have the share of approximately 22% in total export. Cyprus, Malta, Greece and Ireland are positioned on the bottom of the scale and confirmed to be countries with deepest lack of RCA in whole EU. Next Table 7 shows export-import ratio indicator for EU28 automotive industry from year 2013 to year 2018.

Table 7: Export-import ratio for EU28 automotive industry

EU28	2013	2014	2015	2016	2017	2018
Export import ratio	466	437	395	326	293	276

Source: Eurostat statistical database, 2020

Table 6 confirms that exports exceeds imports of European automotive industry within observed period. However, there is decreasing trend of export-import ratio for EU28 automotive industry. One of the reasons could be found in the fact that imports grew faster that exports through observed period. Initial period was characterized with higher results of export-import ratio indicator while years 2017 and 2018 proved to have lower numbers of export-import ratio. Just for an example in year 2018 there was slight decline in EU car export volumes (-1.6%) and a substantial increase in imports (+9.3%). In year 2015, EU exports of heavy commercial vehicles and buses increased (+2.3%), while the export value of light commercial vehicles remained stable (+0.9%), worth around €4 billion. Despite a significant increase in total commercial vehicle and bus imports (+27.7%), the EU's trade balance remained positive over the year, with a trade surplus of €3.8 billion (ACEA,2020). Following Chart 1 illustrates export, import along with trade balance of EU28 automotive industry for the period between 2013 to 2018.

Chart 1: EU-28 automotive industry export, imports and trade balance in motor cars
Source: Eurostat statistical database, 2020

The observation of Chart 1 indicated strong trade surplus of the EU automotive industry of 28 EU Member States. However, the weak volatility is present. An increase of trade surplus of the EU automotive industry is characterized for years 2014-2015 and 2016-2017 while the decrease is evident for years 2015-2016 and 2017-2018. It is evident, that in year 2018, there was a sharp decline in the registrations of new passenger cars in Europe. The regulations connected to technological changes and higher requirements for the reduction of CO_2 emissions, had implications on the (international) competitiveness of the EU automotive industry. Moreover, the decline in German exports was strongly influenced by the collapse in the exports of diesel-powered cars, which decreased by over 180,000 units, i.e. by 40 per cent compared to the third quarter of year 2017 (Obserwatorfinansowy, 2020). The downturn in the automotive market has consequently contributed to a slowdown in the EU. Although Poland currently isn't

included among the leading car exporters in the European Union, it is still heavily influenced by the economic situation in the European automotive market. This is because it is one of the biggest exporters of automotive parts in the EU.

5. Conclusion

The basis hypothesis of the research is confirmed, pointing out that it is,, possible to estimate current state of international competitiveness of the EU automotive industry countries by using common and recognized competitiveness indicators". In details, we have tested Revealed Comparative Advantages (RCA), export-import ratio and trade balance of automotive industry for EU 28 Member States between 2013 and 2016.

This research included individual and general approach in the analysis of Revealed Comparative Advantages and international competitiveness. Special focus was put on main branches of the EU automotive industry and its categories. Motor cars and other motor vehicles for the transport of persons (Branch 781), Motor vehicles for the transport of goods and special-purpose motor vehicles (Branch 782), Road motor vehicles, n.e.s. (Branch 783) parts and accessories of the motor vehicles (Branch 784), Motor cycles (including mopeds) and cycles (Branch 785) and Trailers and semi-trailers (Branch 786) were main part of the research.

Germany, Slovakia, Poland, Czech Republic, Romania, Spain and France confirmed to be countries with highest level of RCA for the most of examined branches. It is evident that the biggest car production facilities are in previously mentioned countries. On the opposite, Greece, Malta, Cyprus and Ireland recorded the lack of RCA. This makes sense because these countries do not have developed automotive industry.

The negative macroeconomic repercussions affected the German economy to the greatest extent, but they were also felt in several other EU countries, owing to the strong international ties within the European automotive industry. EU automotive industry faces challenges like environment legislative (EU legislative – new emissions standards), decrease in demand (declines in the number of registrations of new passenger cars), technological changes (diesel motor engines), new market trends with bright future (electric vehicles (EV) market). Just for an example, The Volkswagen group suffered the most, reaching a decrease of registrations of nearly 50 per cent.

Bright news could be seen from the perspective trade surplus from 2018, which is on higher level than in year 2013. However, the trade surplus show volatility and small instability. To be a strong competitor in automotive industry on a global level, EU car companies need to restructure their production, absorb changes and transform it to its comparative advantages.

Due to the current COVID-19 lockdown in year 2020, the perspective of EU automotive industry looks very unstable and uncertain. The world demand and supply for the products of automotive industry recorded sharp decline which will additionally impact on international competitiveness on a negative way. In order to weaken negative effects of COVID-19, EU automotive closed their factories in order to reduce fixed costs of production. For the future, it is expected that the EU automotive producers will orientate themselves towards intensified implementation of costs- efficiency methods. These methods would reduce the negative impact on current level of their international competitiveness.

BUDGET FUNDING AND ECONOMIC IMPORTANCE OF CULTURAL AND CREATIVE SECTORS IN CROATIA

ABSTRACT

The cultural and creative sectors (CCS) are a sector whose activities are based on the cultural values and creativity, whose value for national economy shows valuable effect, it is prerequisite for development Creative economy and has strong impact on society. As well, the New European Agenda for Culture and the New Work Plan for Culture 2019-2022 emphasizes the importance of CCS for innovation, job creation, cohesion and the well-being of society.

The aim of this paper is to analyze the significance of the CCS for the Croatian economy and the level of recognition by the policy makers which was measured through the level of national support with the emphasize on the support directed towards financing of its international cultural cooperation. The authors conducted the statistical analysis of official data published by Eurostat, Croatian Bureau of Statistic and the Croatian Ministry of Culture and gave the overview of the relevant literature in the field of the research.

It was found that the cultural employment and the number of entrepreneurs have decreased; nevertheless they succeeded to achieve the growth of added value. As well, it was determined that the national budget support for CCS has increased during the observed period, which proves that the policy makers are recognizing their significance and developing models for their support. Following, by the analysis of the recent literature, the authors gave the recommendation of the model for support of further development of CCS, which covers financial and other forms of support.

Key words: *cultural and creative sectors (CCS), cultural employment, expenditure on culture, international cultural cooperation.*

1. Introduction

The Cultural and creative sectors (CCS) have been recognized as important contributors to social development in different key European policy documents (EC, 2013, 6) where it is positively influencing and promoting the European identity, culture and values (Haršanji et al., 2018) to which, as well, the cooperation of project partners from different European

countries on joint project, significantly contributes. According to Haršanji et. al (2018), some of the value added created at European level through the international project co-operations relates to development of a European mindset, enhancement of the quality of partnership activities, creation and strengthening the networks and contacts for future co-operations and development of a common European identity. For years the EU has been providing support for European culture and the audio-visual sector through different financing programmes, contributing to building European CCS. Within the new Creative Europe programme (2021-2027) organisations in CCS will have the opportunity to realise technologically and artistically innovative European transnational initiatives for the exchange, co-creation, co-production and distribution of cultural and creative products and services that will be available to a broader audience. Even though the implementation of the Creative Europe programme so far has delivered a number of positive effects, the programme has its disadvantages, such as an insufficient budget to meet the demand. However, the new budget is additionally increased for 26.71% on € 1.85 billion (in the previous programming period it was € 1.46 billion).

CCS's activities are based on cultural values and/or artistic and other creative expressions, irrespective of whether those activities are profit or non-profit oriented. These activities include development, creation, production, dissemination and conservation of goods and services that embody cultural, artistic or other creative expressions, as well as related functions such as education or management. Bakhshi (2019) gave reasons why the CCS in UK became recognized on policy level and accepted as industry. "These institutional factors for the growing recognition of the UK's creative industries are the product of years of dedicated research directed toward policy agendas and impact.

- the creative industries are accepted by government as playing an integral role in the digitisation of the economy and vice versa.
- policy-focused research has become much better at measuring the economic contributions of the creative industries, including understanding the significance of digital technology within it.
- the UK Government has placed R & D at centre stage of its industrial strategy, and there has been initial success in making the case for public investment in creative industries R & D.
- the sector has organised effectively to represent its interests to government, with influential sector-wide bodies like the Creative Industries Council and, more recently, the Creative Industries Federation" (Bakhshi, 2019, 27).

Following the analyzed relevant theory on the level of EU and member countries, the authors wanted to investigate the situation in Croatia. Therefore the aim of this paper is to analyze the significance of the CCS for the economy of Croatia and the level of their recognition by the policy makers. For that reason, the authors have set the research statement that the importance of the CCS is in growth and being recognized by the policy makers. For that purpose the authors gave an overview of the relevant recent literature in the field of research and conducted the statistical analysis of official publications of Eurostat and the Ministry of Culture of the Republic of Croatia.

This paper is structured as following: the chapter two gives the recent literature review about the importance of CCS for national economies as well as trends that are impacting its development. Chapter three gives the methodology of the research whose results are presented by the chapter four. The following chapters are giving the discussion and conclusion as well as research limitations and the recommendations for the future research.

2. Literature review

The CCS are structured by numerous micro and small enterprises, numerous non-governmental organizations (NGOs) and local associations (Dovey et al., 2016), individual artists (Hearn et al., 2004) who are usually non-conventional, have part-time employment, temporary contracts, or are self-employment (Skoglund, 2012). The importance of NPOs in CCS is, among other things, in "promoting culture and creativity across regions" (Zbuchea, Leon, 2015 in Cruz et al., 2019, 2). The multidisciplinary nature of the cultural and creative workforce is "moreover consistent with the literature identifying the competitive advantage for companies that combine skills in art and science, the so called 'fusion skills'" (Nesta, 2016). "On the economic side, CCS is growing fast and has shown to be resilient to the economic crisis" (KEA, 2019a, 10). According to the EIF[1] (2019, 6), European CCSs have had 6.7 million employees and more than 2.4 million companies in 2016. "Recent studies from regional to European level have highlighted the considerable economic weight of the CCS (number of businesses, added value, employment) as well as the significant spillover effects that they generate for other industrial sectors" (EC, 2019a, 10). The innovative power of CCS "is essential for further development of European economies and societies, because it:

- generates well-being and cohesion;
- shapes the public space used by millions of Europeans;
- modernises industries and business sectors with new creative input and methods;
- provides meaning and a sense of belonging;
- upgrades urban and rural areas;
- designs products and services;
- produces and digitises content;
- enriches visual experiences;
- provides content for debates" (EC, 2018a, 6).

The development of CCS is nowadays increasingly influenced by different global megatrends, including digitalisation. Activities like listening to music, playing video games, reading the papers or watching films have become unimaginable without the internet, which is also increasingly used for other culture-related purposes, such as buying cultural products like books, magazines or concert tickets, or visiting virtual theatres and museums. "Digital technologies are more than a 'contextual factor'; they are often an 'enabling factor', or even a radical step in the context of the new industrial revolution, changing the way culture and CCS products and services are produced and accessed, and how knowledge is transferred" (EC, 2018a, 11).

The European Union (EU) supports CCS, among other things, through various funding programmes, most importantly the Creative Europe Programme[2], which supports the European culture and audio-visual sector. It also seeks to enhance European cultural and linguistic diversity, promote European cultural heritage, and strengthen the competitiveness of European organizations operating within CCS. Cultural exchanges can result in added economic benefits. In that regard, the EU supports projects facilitating the interconnection of CCS activities, including culture and audio-visual contents, using innovative technological solutions in order to increase the competitive advantage of institutions in CCS. As well, "the Ministry of Culture (on national level) and larger cities (on local level) are major founders of international cultural cooperation projects and initiatives" (Compendium, 2016).

The number of non-profit organisations and public institutions that have access to co-financing of cultural activities and programmes from public sources is in rise in Croatia.

---

[2] More information at https://ec.europa.eu/programmes/creative-europe/node_en (18 February 2020)

Cultural and creative artists are also showing an increasing interest in international cooperation, and Croatian cultural institutions, non-governmental organisations and other professionals are active members of international organisations in culture and arts.

Given their undeniable significance the aim of this paper was to analyze the role of CCS for the economy of Croatia, where the authors wanted to analyse whether the importance of the CCS is recognized by the policy makers as well. This statement was tested through the analysis of budget funding of culture during the period 2014 to 2018. The level of recognition of the government was measured by the grant value and number of projects approved in the observed period.

3. Methodology of the research

In the frame of this research the authors analyzed cultural employment, enterprises in cultural sectors and expenditure on culture in Croatia. The authors conducted the statistical analysis of official publications of Eurostat and the Ministry of Culture of the Republic of Croatia as well; they gave an overview of the relevant recent literature in the field of research. Information on the companies in CCS were analysed using two different statistical analyses, "Structural Business Statistics" (SBS), which describes the structure, conduct and performance of enterprises (e.g. value added, turnover, personnel costs) within the non-financial economy and "Business Demography" (BD), which includes indicators such as enterprise birth and enterprise death rates or enterprise survival rates, and cover the cultural market-oriented activities. In the frame of mentioned methods, the authors have analysed the following characteristics of CCS in Croatia:

- the structure and number of cultural enterprises,
- employment in culture,
- engagement of the population in cultural activities,
- public expenditure on culture.

The general importance of international cooperation in culture and approved projects in culture financed by the Croatian Ministry of Culture 2014 - 2018 are likewise discussed. Projects within the Creative Europe programme are one of the important programme activities which can be co-financed from the budget of the Ministry of Culture. Croatian programme applicants who have received funds from EU budgets can also apply to the calls for funding published by the Ministry of Culture.

For the purpose of conducting this study, the authors analysed data collected from the publications of the European Commission and the Croatian Ministry of Culture, as well as Eurostat's statistical data. The methods which the authors used include induction and deduction, analysis and synthesis, classification, and the statistical methods.

4. Analysis of CCS in Croatia

"Compared to other sectors of the economy, culture has an additional dimension – it not only creates wealth but it also contributes to social inclusion, better education, self-confidence and the pride of belonging to a historic community" (Titan et al., 2008, 930). At the same time, "creativity and culture have a significant non-monetary value that contributes to inclusive social development, to dialogue and understanding between peoples" (UN, 2020).

According to Sava et al. (2017, 79), "culture is the long-term runner for development. Also culture can be seen both as cause and as effect of the economic development; as cause of the economic development – it is the source of generating employment and revenues and as effect - due to peoples' habits of spending on culture when the incomes are higher".

Since Croatian cultural policy underwent radical changes in the 1990s, the importance of the

cultural sector only started to be recognized in the early 2000s, when the number of new non-profit organisations in the CCS increased (specially in the field of music, film, audio-visual arts etc). Considering that CCS only started to be noticed by the general public in the recent years in Croatia, there is still no official framework that would provide an exact definition of CCS or agreed unified model for support their development. The Croatian cluster of competitiveness of creative and cultural industries (HKKKKI)[3] mapped cultural and creative industries in Croatia in 2015 and determined that CCI in Croatia are composed of 45 industries divided into 12 subsectors.

The importance of these relativity new sectors is not only considering the people employed in CCS, but it has more social and economic importance. According to Newbigin (2010, 28), the real significance of the CCS "lies not only in their economic value, or even in their wider social and cultural impact, but in that they provide a template for the way in which other economic sectors need to change if they are to survive and prosper in the digital age".

In the following chapters, the authors analysed the importance of CCS for the Croatian economy and gave an overview of the impact of international (cultural) cooperation on its development.

4.1. Cultural enterprises

"An enterprise is defined as an organisational unit producing goods or services which have a certain degree of autonomy in decision-making; it can carry out more than one economic activity and it can be situated at more than one location" (EC, 2019b, 101). Cultural enterprises active in cultural (and creative) sector are classified according to economic activity (NACE Rev. 2[4]). As mentioned in the previous chapter, the information on these companies were analysed using two different statistical analyses, "Structural Business Statistics" (SBS) and "Business Demography" (BD). The presented number of cultural enterprises in Croatia 2014-2016, classified by their activities, was extracted from the Eurostat publications, analysed using the SBS method and results presented through Table 1.

---

	Decrease from the previous year			-0.6%	-0.4%	
	Decrease in comparison to year 2014			-0.6%	-1.0%	

Source: Authors' work according to Eurostat publication (EC, 2020d, 2020f)

The table above reveals a downward trend in the total number of cultural enterprises in Croatia 2014 - 2016, where 61% (11 out of 18) of analysed business activities have shown negative trend in 2016 in comparison to 2014 (that was still a year of long lasting economic crises in Croatia). By observing three years (2014 – 2016) the negative trend was slowing down in 2016, but the total decrease in numbers of CCS enterprises in comparison to the base

year (2014) was 1% (decrease for 69 enterprises). In comparison, the average number of cultural enterprises in the EU-27 is 5% (Eurostat, 2020c). However, cultural enterprises operating in architectural and specialised design activities and video and TV programme production had a tendency of growth. The graph below presents the structure of enterprises by area of activity in 2016 in CCS in 2016.

Graph 1: Structure of CCS enterprises in Croatia by area of activity in 2016 (%)
Source: Authors' work according to Eurostat publication (EC, 2020d, 2020f)

As shown in the previous graph, most of the enterprises in the cultural sector were active in "Printing and reproduction of recorded media" (20%), "Architectural activities" (19%) and "Specialised design activities" (14%) where, as shown by Table 1, only "Printing and production of recorded media" achieved negative results of the companies active in 2016 in comparison to 2014.

By observing the structure of the active enterprises in Croatia in all industry sectors, the overwhelming majority (99.7%) were small and medium-sized companies (SME's) (including micro-sized enterprises) which are generating more than half of the value added (61.3%) of non-financial business economy (DZS, 2018). Table 2 shows the total number of cultural enterprises in relation to the total number of all enterprises in non-financial business in Croatia (i.e. national economy excluding financial and insurance activities).

Table 2: Number of cultural enterprises in Croatia in relation to the total number of enterprises 2014 - 2016

	2014	**2015**	**2016**
Total number of enterprises	**147,337**	**146,637**	**147,481**
Change in comparison to 2014 (%)		-0.48%	0.58%
Number of cultural enterprises	**6,658**	**6,615**	**6,589**
Change in comparison to 2014 (%)		-0.65%	-0.39%
The share of cultural enterprises in total number of enterprises (%)	**4.52%**	**4.51%**	**4.47%**
Change in comparison to 2014 (%)		-0.01%	-0.05%

Source: Authors' work according to Eurostat publication (EC, 2020c)

The table above shows the decrease in the number of cultural enterprises in Croatia in the period 2014 - 2016. But, by observing only the number of cultural enterprises the impact on the total economy of Croatia cannot be seen, so the results of the analysis of value added at factor cost was presented. The value added is showing how activities of CCS are contributing to general wealth.

According to Eurostat (2020a), measured by its share in non-financial economy, the value added at factor cost of cultural enterprises in 2015 - 2016 was EUR 527.5 million and EUR 546.3 million, that is growth of 4%, i.e. growth from 80 thous. EUR to 83 thous EUR per enterprise per year. The value added of total business economy in Croatia 2015 - 2016 was approximately EUR 21.2 billion and 22.1 billion, respectively in which CCS achieved an equivalent to 2.49% and 2.48%, respectively.

Thus, the analysis showed that a smaller number of cultural enterprises in 2016 compared to 2015 generated a higher EUR amount of value added.

4.2. Cultural employment

The scope of cultural employment on the one hand includes employment in companies practising activity in the cultural domain – economic activities (NACE Rev. 2[5]), and on the other employment in cultural occupations (ISCO-08[6]). Cultural employment arises in 3 forms:

- The working population that both exercises a cultural occupation and works in the cultural sector (e.g. a singer in a singing company).
- The working population that exercises a cultural occupation outside of the cultural sector (e.g. a designer in the video game industry).
- The working population that exercises a non-cultural occupation in the cultural sector (e.g. an accountant in a photographic studio).

The CCS labour market is defined as a high level of flexibility because it includes part-time, self-employment and multiple job holding (Feist, 2002, 20-21; Pratt, 2017 in Cellini et al., 2018, 9).

The following table presents cultural employment in EU-27 and Croatia (based on the total number of employees) in the period 2014 - 2018 as a percentage of total employment.

Table 3: Cultural employment by sex 2014 - 2018

Level	2014	2015	2016	2017	2018
EU-27* (%)	3.6	3.6	3.6	3.7	3.7
Croatia (%)	3.8	3.4	3.1	3.5	3.3

Source: Authors' work according to Eurostat publication (EC, 2020e)

According to the Eurostat statistic database, cultural employment in EU-27 recorded an upward trend in the analysed period. In Croatia, the average share of cultural employment in total employment through the observed period (2014 to 2018) was on the level of 3.4%. In the year 2018 there were approximately 54,200 (3.4%) employees engaged in the cultural sector. There were approximately 7.3 million people employed in a cultural activity or a cultural

---

[5] NACE is derived from the French title "Nomenclature générale des Activités économiques dans les Communautés Européennes" (Statistical classification of economic activities in the European Communities).

[6] The International standard classification of occupations, abbreviated as ISCO, is an international classification under the responsibility of the International Labour Organization (ILO) for organising jobs into a clearly defined set of groups according to the tasks and duties undertaken in the job.

occupation in EU-27 in 2018, that is 3.7% of the total employment in the EU but the share of this specific category is varying in dependence of the country. For example, Estonia as one of the fastest growing economies has an above average share of employees in culture of 5.6%.

As well, it is significant to point out that out of all active enterprises in all industry sectors in Croatia, the small and medium-sized companies (SME's) (including micro-sized enterprises) "are generating more than half of the value added (61.3%) of non-financial business economy" (DZS, 2018, 1), therefore their significance for national economy is high. Unfortunately, the number of enterprises in the CCS in Croatia, according to Eurostat, was decreasing. For that reason, in the following chapter, the authors analysed the trends regarding the total government expenditure on culture and creative industries with the purpose to determine whether the policy makers recognized the importance of CCS.

4.3. Public expenditure on culture

Public cultural facilities (e.g. cinema, theatre, museum, library, gallery, cultural institution), "cultural products, cultural activities and other related cultural services are very important deliveries for government to meet the public's basic cultural needs" (Tu et al., 2017, 709-710). Even though expenditure on culture can come from different sources, most funding in culture comes from public funds.

The Ministry of Culture of the Republic of Croatia regularly finances different programmes within programme activities according to its five cultural fields; Investments, Cultural Heritage, International Cultural Cooperation, Archive, Library and Museum System, and Artistic Creativity in CCS. Since one of the main objectives and missions of the Ministry of Culture is to support international cultural cooperation and promote and develop direct and continuous cooperation and exchange between organisations in culture, the Ministry of Culture strives to financially support the participation of cultural professionals and other artists in many different multilateral programmes promoting the own culture, development of intercultural dialogue and cultural diversity" (Psychogiopoulou, 2015).

This facilitates a broader presentation of Croatian culture in other countries, as well as the presentation of the culture and vice versa through the translation and publication of literary works, presentation of films and art exhibitions, guest performances, dance and music performances, and participations in book fairs and other international cultural events and conferences. For the purpose of the analysis of the recognition of the importance of CCS for the economy by the government, the results of the trend analysis of the total general government expenditure on culture in Croatia 2014 - 2018 is shown in the table below (including exclusively cultural services according to the COFOG) with the emphasis on the International Cooperation shown by the table 4 and 5.

Table 4: Total general government expenditure on culture of the total state budget in Croatia 2014-2018 and the budget of the Ministry of Culture 2014-2018

	2014	**2015**	**2016**	**2017**	**2018**
Total general expenditure on culture – cultural services (% of the total state budget)	1.6	1.4	1.3	1.4	1.5
Budget of the Ministry of Culture (000 HRK)	770,808	867,963	923,946	1,131,631	1,209,592
Annual increase in %	-	12%	6%	22%	7%

	2014	**2015**	**2016**	**2017**	**2018**
Increase in comparison to base year (2014) in %	-	12%	20%	47%	57%

Source: Authors' work according to Eurostat (EC, 2020d) and the Ministry of culture of the Republic of Croatia (2014-2018a)

The table above shows that expenditure on culture in Croatia on average accounted for 1.4% of the total state budget in the five-year period. In comparison, the EU-27 average is 1,0%. (EC, 2020d). But, there are rare positive examples such as funding culture of Latvia and Iceland that is above the EU average: 2.9% and 2.6%, respectively. The budget of the Ministry of Culture increased continually 2014 - 2018 for 57%.

In comparison with the above presented categories, the annual expenditures of the Ministry of Culture on International Cultural Cooperation are about 15% of all programmes. The Ministry finances programmes in two programme activities, International Cultural Cooperation and Creative Europe programmes. Structure of financing of the programme International Cultural Cooperation 2014 - 2018 is presented in the following table.

Table 5: Financing of the programme activity International Cultural Cooperation 2014 - 2018

Programme activity International Cultural Cooperation	**2014**	**2015**	**2016***	**2017**	**2018**
Approved funds (000 HRK)	6,992	6,368	6,735	7,869	10,236**
Number of approved programmes	517	515	575	666	814

* Data are only available for the period ending 7 September 2016, whereas data for other years are available for the period ending 31 December.
** There is a mismatch in the different official reports: The Annual Report and the Approved Projects report
Source: Authors' work according to the Ministry of Culture (2014-2018b, 2020a)

The table above shows that the number of approved programmes and the amounts of approved funds significantly increased in the five-year period. It may be concluded that the funding for the programme activity International Cultural Cooperation is gradually increasing. This programme finances activities in sub-programmes Archives, Music Performances, Interdisciplinary Projects, Performance Arts, Theatre and Dancing Performances, Literature, Libraries, Cultural Heritage, Cultural and Artistic Amateurism, International Events and Conferences, Museums and Galleries, New Media, Residences and Visual Arts and other. Most of the funds, around 40% of annual approved programmes, are allocated to the sub-programme activity Performance Arts.

In addition to programme activity International Cultural Cooperation, the Ministry of Culture finances the programme activity Creative Europe programmes, providing Croatian institutions that have already obtained funds for their projects from the Creative Europe programme with additional funding. Creative Europe is one of the EU's programmes aimed at reinforcing European CCS and protecting, developing and promoting European cultural diversity, among other things. Creative Europe programme provides financial supports to small and medium-sized enterprises (SME), micro-companies and organizations in CCS.

Programme activity International Cultural Cooperation results by Ministry of Culture (2019, 2020b) reveal an increase in the number of approved programmes and an increase in the amount of approved funds by 14%, as shown in the table below.

Table 6: Financing of programme activity Creative Europe programme – Sub-programme Culture 2018-2019

	2018	**2019**
Approved funds (000 HRK)	1,490	1,700
Number of approved programmes	58	63

Source: Authors' work according to Ministry of Culture of Republic of the Croatia (2019, 2020b)

The Ministry's report also states that the number of programmes approved in 2018 has doubled in comparison with 2017, which also confirms the upward trend in the number of approved programmes in recent years, and the fact that the Ministry of Culture has recognised the importance of promoting international cultural cooperation, which contributes to CCS development in Croatia.

5. Discussion

Even though CCS enterprises play an important role in the majority of European economies and have achieved continual value-added growth and growth of employment in past years, they also face major challenges. Competition has increased with the new social platforms, and CCS organisations have to use the advantages of digital technologies to facilitate the distribution of cultural and creative contents, and thus increase their competitiveness in the global market. By adapting to digitalisation, beneficiaries in CCS can showcase their work internationally by accepting cultural diversity through innovation and development of new business models. In this connection, according to KEA (2019b, 60), it's assumed that in the near future (in the next 10 years) the European "CCS is likely to continue acting as a significant driver of territorial attractiveness" and "remain strongly competitive". Also, "for the CCS will be created new incentives in the form of tax reductions, direct financial support or creation of new jobs in the sector. This support from the EU will foster the development of the CCS" KEA (2019b, 61).

The analysed information about the cultural entrepreneurship showed that the cultural enterprises accounted for 6,589 or 4.45% of the number of total active enterprises (while on the level of the EU-27 it is 5%). As well, the value added at cost factor of cultural enterprises in Croatia was EUR 546 million, equivalent to 2.48 %[7] (DZS, 2018). Although, according to DZS (2018) there was a growing trend in the number and results of SME's it seems that the cultural sector did not fully follow those positive trends. This was confirmed by the downfall of the number of cultural enterprises and the employment in CCS in comparison to the total employment on the national level.

According to Sava et al. (2017, 83), in some European countries the employment in CCS "depends on how rich is a country's economy and this also impacts the fluctuation of the cultural employment".

Nevertheless, the CCS are still playing a significant role measured by the value added.

Here it was found that a smaller number of cultural enterprises in 2016 compared to 2015 generated a higher value added although its contribution to the value added of the total

---

[7] Generally, value added at cost factor is the gross income from operating activities after adjusting for operating subsidies and indirect taxes. It can be calculated as the total sum of items to be added (+) or subtracted (-): turnover (+); capitalised production (+); other operating income (+); increases (+) or decreases (-) of stocks; purchases of goods and services (-); other taxes on products which are linked to turnover but not deductible (-); duties and taxes linked to production (-). Alternatively, it can be calculated from the gross operating surplus by adding personnel costs (EC, 2019b, 101).

national economy is not significant. Nevertheless, it can be seen that there is a growing trend in state financing of cultural projects including international project cooperation financing that confirms that policy makers are recognizing the CCS as an important factor.

According to IRMO (2014), "among sectors identified as important for the promotion of access to culture and participation the following sectors have been identified - education, tourism, minorities, media and information society, regional development, urban planning and the protection of environment" IRMO (2014, 179). The New Agenda, backed with appropriate funding will exploit synergies between culture and education and strengthen links between culture and other policy areas. It will also help CCS overcome the challenges and grasp the opportunities of the digital shift (EC, 2018b, 3). As Bakhshi (2019) stated there is need of years of research directed towards policy agendas and impact of the CCS to achieve the result that is measurable by quality and structure of the measures for supporting the CCS.

Billi et al. (2019) claim that there are three basic activities through which the policy makers (the System) could use to increase the development of cultural innovation initiatives which is broader than financial support measures (Billi et al., 2019, 37):

"(1) the social impact investments/finance can be a concrete incentive for cultural innovation projects because it puts the focus on the social impact of investments in addition to the focus on financial sustainability"

"(2) the potential of development of projects tied to the Manufacture 4.0 and to digital handicraft, the radical transformation of production systems through the merging of technologies and new customization opportunities" through development of co-working innovation centres (according to the model of FabLabs in Italy)

"(3) The policies for Urban regeneration and revitalization of the outskirts can play a fundamental role in promoting bottom-up initiatives" (utilization of unused public and private heritage) (Billi et al., 2019, 37).

Farinha (2018) gives further recommendations to "establish more business-friendly regulations and incentives for CCIs business creation and development, including investments from abroad. The tax system should be simplified, to allow easy start up – especially regarding reduced obligations for entrepreneurs in ramp up years with reduced obligations for entrepreneurs" (Farinha, 2018, 41). As well, there is possibility of introduction of different models of distribution of financial support where institutions and enterprises in CCS could be categorized by their success in achieving relevant criteria and strategic relevance of the project and activities for the community. (Bestvina et.al., 2016) Klamer et. al. (2020) are confirming that statements but, they are finding the challenge in generating more active widespread private and corporate support in financing the CCS. All those measures could be a part of a package of measures for support CSS in Croatia.

6. Conclusion

This research is focused on a broader understanding of the key topics within the CCS in Croatia and the recognition of the international cultural cooperation by the state. Analyzing CCS in Croatia through cultural employment, cultural enterprises and public expenditure on culture in Croatia the authors noticed that the number of cultural enterprises and also the employment in companies practising an activity in the culture show a negative trend in the period 2014-2016. International cultural cooperation, generally, includes an exchange of experiences, know-how, skills, information and similar cultural activities with partners outside of national borders. The mobility of cultural subjects and artists and sharing of cultural productions and works of art with partners from other countries expands new ideas, creates new ways of communication and encourages innovation. The analysis of data in this paper has shown that the Croatian Ministry of Culture continually increases the funding of

culture and funding for international cultural cooperation programmes. In addition to financing international cultural cooperations between Croatian organisations in CCS and the rest of the world, the Ministry of Culture offers the Croatian programme of support of applicants for the EU funds– Creative Europe Programmes. Therefore, Croatian organisations active in CCS are having the opportunity of funding the creation, co-production and distribution of cultural and creative products and services with other European countries, to make them available to a broader audience. As of the value and the number of budget funded projects in the analysed period show a growing trend, the basic research statement about the importance of the CCS and their recognition by the policy makers was confirmed.

Next step of the CCS support is the development of measures and a regulatory frame that would be constituent parts of the development model. Here, the best model for cultural-based development in Croatia would be creating a clear cultural framework policy and cross-collaboration between the government, organizations in CCS and other interrelated sectors of the economy as suggested in the frame of this paper.

Research limitations: There are several limitations to the authors' research to consider. The primary limitation is differences in methodology where in some reports culture is observed with recreation and religion. As the result of the Brexit there is, in some cases, different methodology used about the CCS contribution on the level of EU, where information on EU-27 were presented where possible. In those case the information about cultural services were analysed. As well, there is a lack of data through a longer period, which limits the possibility of conducting analysis of trends and more complex statistical analysis. In addition, the authors noticed different values of financial supports for same programmes in two official reports related to international cultural cooperation. Nevertheless, this did not have a substantial impact on the final interpretation and conclusions.

Recommendations for further research: future research should further analyse the level of recognition of the CCS by the policy makers (government) by conducting comprehensive desk research on the available data on government measures and their impact and comparison to other EU countries. As well, in-depth interviews with policy makers and actors in CCS could reveal the reasons for the decrease in employment and number of enterprises in the CCS in Croatia.

COLLECTION OF TESTAMENTARY NOTES AS AN INDICATOR OF THE ECONOMIC SITUATION OF THE INHABITANTS OF THE CITY OF OSIJEK IN THE PERIOD THE SECOND HALF OF THE 19TH CENTURY

ABSTRACT

Private legal documents are one of the most relevant sources for exploring the various aspects of the social life of their drafters, but also of those in whose favour those documents had been drafted. Due to the lack of preservation of archival material created in the 19th century, exploration of the economic circumstances of individuals as well as the social community is sometimes difficult, and documents that can serve as authoritative sources are very rare. For this reason, and due to the lack of other records to serve for this purpose, testamentary records kept within the archives of the Royal Judicial Table in Osijek from 1851 to 1899 are of invaluable value in determining the economic status of the testator and their disposition in case of death in terms of valuable property rights and facilities. The legal-historical analysis of the contents of the wills in the relevant period and the comparison of the established results in this research will seek to determine the formal and legal characteristics of individual records, as well as the content characteristics that indicate the economic structure of the testator, the inhabitants of the city of Osijek in the observed period. Particular attention will be paid to the content of testamentary records, which, for their religious or charitable purpose, testify to the economic needs of citizens, but also to the economic development that characterized the social reality of that time.

Key words: *private legal documents, Royal Court of Justice in Osijek, testamentary records, records, economic development.*

1. Introductory notes

Testamentary material, as one of the most relevant sources for the study of social, economic and legal issues, is a very exhaustive object of much research within European historiography. In this respect, the interest of the authors who dealt with these sources in great detail is often limited to the study of demographics, culture, mentality, religiosity and medieval social circumstances, while the interest in the legal content and importance of testamentary records, both medieval and modern times, remains out of the realm of research by relevant authors. When it comes to the Croatian Middle Ages, one must note the considerable enthusiasm of the authors who, through the analysis of testamentary records, sought to identify the social

circumstances of the period to which they referred more closely, or the reasons why the testator composed them. The scientific contribution of these authors and their publications to the discussions on this topic is, without further ado, immense. [1] However, it is useful to note that there has often been a lack of interest in the legacy research into the legal aspect of their creation, as well as in the form and the applicable law for determining the validity of their contents. Where there is interest, it is mostly geographically limited surveys of testamentary records on the Croatian coast, i.e. coastal cities and islands, or religious motifs that are substantially restricted to research, and which prompted the testator to draw up documents. An attempt to find similar discussions on testamentary records in the Slavonia area, more precisely the city of Osijek, has remained unsuccessful. For this reason, further research will seek to determine the contents of testator's wills from the territory of the City of Osijek during the second half of the 19th century, since archival material from earlier periods of the city's history has not been preserved. However, it will be possible to determine the circumstances of the early 19th century through the records of the Osijek city administration, the competent body for storing and preserving testamentary records. Since the emphasis of this research is primarily on the economic circumstances of the urban population during the period under review, particular attention will be paid to the analysis of those testamentary records, which, apart from regular cases of disposition of death, contained legacies for the benefit of public or religious institutions of the city. They undoubtedly contribute to the understanding of the economic situation of the testator, as well as the economic needs of the urban environment, which they use for both private and public purposes.

2. Applicable law for the contents of the wills in the reference period

The characteristics of the wills that were analysed in the content of this research did not indicate significant deviations, despite the different legal regimes in force in the Slavonia region from the beginning to the end of the 19th century. Until the Austrian General Civil Code (hereinafter ABGB) [2] came into force in 1853, the relevant sources for the contents of testamentary

[2] A general civil code called Allgemeines Bürgerliches Gesetzbuch was proclaimed an imperial patent in 1811 in the Austrian hereditary lands of the Habsburg Monarchy. It was modeled after the Pandect Law, canonical, feudal and German customary law. From May 1, 1853, on the basis of the imperial patent, from November 29, 1852, it

documents were contained mainly in customary law, sometimes in city statutes, and to some extent governed by the provisions of tripartite law contained in the Werbőczy's Tripartite Collection of 1514.[3] The will was recognized as an expression of the last will of the decedent and used by a legal institute in the territory of Slavonia even before Tripartite came into force. This is evidenced by the legal provisions of the Ilok Statute. According to the provisions of this source, it is permissible to dispose of real estate and movable property irrespective of the manner in which they are acquired. A woman is allowed a testamentary disposition of the property acquired under her dowry.[4] The noteworthy provision primarily concerned the obligation to settle creditors before the heirs of a will, which in its content proves that early Slavonic wills often contained provisions on dispositions for the benefit of the church, hospital or the poor. Although the Ilok Statute does not call them legacies, as is the case in some earlier sources of medieval law, primarily the statutes of the Dalmatian communes, there is no doubt that this provision indirectly indicates the possibility of such disposition.[5] The following will outline the inheritance provisions of tripartite law to the extent that it is possible to analyse the legal framework of testamentary documents deposited in the State Archives in Osijek. Also, in relation to individual succession law institutes that are primarily regulated by tripartite law, an attempt will be made to provide the legal framework created after the entry into force of the ABGB.

In tripartite law, as well as in Roman and canonical, the will is statement of the last will of the testator by which he transfers all or part of his property to one or more persons. [6] Each will could be amended or revoked, which makes it different from the succession agreement where such unilateral disposition was not possible. The provisions of tripartite law determine the presumptions of validity and several manifest forms of wills. In terms of validity, the assumptions were divided into external and internal. The external presumption governed the testator's legal capacity to dispose of his estate in in case of death, as well as to enable legal

began to be valid throughout its territory, that is, in the territory of the Kingdom of Hungary, Croatia and Slavonia. Stein, Peter, Rimsko pravo i Europa - Povijest jedne pravne kulture, [*Roman Law and Europe - A History of a Legal Culture*], Golden Marketing - Technical Book, Zagreb 2007, p. 126 . Vukovic, Mihajlo, Opći građanski zakonik- s novelama i ostalim naknadnim propisima, [*General Civil Code - Novels and Other Subsequent Regulations*], Školska knjiga, Zagreb, 1955, p. V-VII. For more on the code-passing process, see more: Van den Berg, Peter A.J., The Politics of European Codification, Europe Law Publishing, Groningen-Amsterdam, 2007, p. 85-119, Beuc, Ivan, Povijest država i prava na području SFRJ, [History of States and Rights in the SFRY], Official Gazette, Zagreb, 1989, p. 19 and 208.

[3] Prior to the entry into force of ABGB in Croatia, there was no single system of legal rules governing inheritance law. Cases of regulation of certain succession institutes are extremely rare. In Hungary, as in Slavonia, there was no reception of Roman law to the extent that it was the case in Germany and France, however, when it came to wills, it was still possible to conclude on the reception of Roman rules. Tripartite (full Latin title: *Opus tripartitum iuris consuetudinarii inclyti Regni Hungarie partiumque eidem annexarum*: Tripartite common law of the glorious Kingdom of Hungary and its associated territories), legal proceedings dating to the mid-19th century was the fundamental source of civil law in the lands of the Crown of Sts. Stjepan (Hungary, Slavonia, Croatia, etc.). Rady, M. (2015), Customary Law in Hungary - Courts, Texts, and the Tripartitum, Oxford, Oxford Scholarship Online, p. 27-28. For the purposes of this research, tripartite law is analyzed through the following source, Lanović, Mihajlo, Privatno pravo Tripartita, [*Tripartite Private Law*], Zagreb, 1929. More about passing laws: Čepulo, D., (2012) Hrvatska pravna povijest u europskom kontekstu – od srednjeg vijeka do suvremenog doba, [Croatian Legal History in the European Context - From the Middle Ages to the Modern Age], Faculty of Law, University of Zagreb, Zagreb, 88-90.

capacity of the successor.[7] Certainly, the testator must have owned the property which he could dispose of in the event of death. Unlike Roman and Canon law, according to which the appointment of heirs (*heredis institutio*) is one of the essential prerequisites for the validity of wills, Croatian-Hungarian law excludes such a provision by standardizing the possibility of dividing the entire property into legatees.[8] This Roman institute disappeared long time ago as an essential part of the will in Slavonia.[9] It is this novelty that will be of particular importance to the content of the particular testamentary records that we deal with in the continuation of our research. External assumptions about the validity of wills are formalities that applied differently to particular forms of wills governed by the Tripartite Law.[10] The internal assumptions of the validity of the will relate to its contents, and by fulfilling them the heir acquired the opportunity to dispose of the property which is the object of the record.[11] Regarding the forms of wills in practical use in the territory of Osijek, it can be noted that the use of civil will (*testament civica*) and public will (*testament publica*), in the period prior to the entry into force of ABGB, was frequent. With the possibility of drafting the will in the usual way, the civil will had to be read before the testator and the witnesses (three witnesses)[12]. On the other hand, public wills were proposed directly to the city government and then signed by the city councillors or notary. There was a possibility of drafting a will before the envoys of the city government, who then reported on these wills and then kept them in the city archive.[13] This form of will is the most common form of expression of the last will of the citizens of Osijek in the period under review, and can be read from the contents of the City Records used as the source of pre-1853 wills.[14] After 1853, the usual form of testamentary records is a private will (*testamenta privata*), which, at the time, is the most common form of the last will of the testator in the city of Osijek. As there were no special testimonies of either nobles or surfs in the total of the testimonials available at the State Archives in Osijek, in the continuation of

---

[7] The personal legal capacity of the testator (*activitas testandi personalis*) was excluded in the mentally ill, angry, insane, low-minded and those who forcibly forced, in fear, in error, and in those who, due to physical defects, could not properly express their will. Juvenile children and those who had been confiscated because of their offenses were also unable to dispose of the will. Lanović M., (1928), Privatno pravo Tripartita, The Private Law of the Tripartite, Zagreb, p. 302, Under Clause 1715: 27 § 1 of Tripartite

[8] Tripartitim 1715:27 § 4: „*Neque praeterea heredis institutio de substantia testamenti amodo etiam imposterum requiratur; verum testatori liberum esto institutionem heredis in testamentum inserere vel ommittere: cuius tamen insertio vel ommissio testamentum non vitiabit.*" See more about wills in the region of Slavonia in: Margetić, L. (1996) Hrvatsko srednjovjekovno obiteljsko i nasljedno pravo, Croatian medieval family and inheritance law, Zagreb, Official Gazette, p. 336.

[10] The reprimands could be written or oral, public or private depending on whether they were made before public authorities or not, and given their affiliation, they were divided into noble, civil, surfs' or peasant and priestly wills. The wills made abroad were also different from those made in the country, as well as complete and incomplete wills. They could also be ceremonial and privileged.

[14] Record no. 249, 29 IX. 1794, in which the testator Mishko Andrakovich seeks to settle the debts incurred on the property he inherited from his late wife, so that their son in law Andro Ivkovich would not have to worry afterwards. Sršan, S. (2000) Zapisnici općine Osijek, [*Minutes of the Municipality of Osijek*]= Prothocollum des Stadt-Raths zu Esseg: from 1794 to 1809., State Archives of Osijek, Osijek, p. 33.

this work the focus is on the handwritten testimonials *(testamentum holographum)* of regular citizens which, in terms of validity, had to be written and signed by the testator, and the oral testimony which had to be stated before two legally capable witnesses in order to have irrefutable legal force *(testamentum privilegiatum nuncupativum)*.[15]After the ABGB came into force, the legal form of testamentary records remained almost unchanged. The changes should primarily be seen in the jurisdiction of the authorities before which the testator could make the last will statements. Thus, the ABGB recognizes both written and oral wills.[16] Written testimonials and *testamentum allographum*. Of verbal, judicial or extrajudicial will.[17] In addition to wills, Croatian-Hungarian law also recognizes two other forms of disposition in the event of death, codicils and legacies. The codicil also appears as a form of expressing the last will of the testator and, under Hungarian law, was considered solely to supplement the will, that is, to specify the will by which the content of the will was supplemented or amended[18] The validity of the codicil according to the provisions of Hungarian law required the presence of three witnesses with the same qualities that were also required from the witnesses of the will.[19] In the case of illiteracy of the testator, legal validity of the codicil was conditioned by the presence of four witnesses.[20] It is important to emphasize that the codicil could, by no means, be a form of disposing of all the property of the testator, since it would then be a new will, but only a part of it. Although codicil is a very rare form of expressing the will of the testator, two cases of such practice have been recorded, the first of which relates to the end of the 18th century, and the second is an integral part of the wills collection, written in 1852. In the first codicil, the ABGB defined the codicil in the same way as Hungarian law. The commentary of the law already states that the legal definition of codicil was taken over from Roman law after the ABGB came into force.[21] As it is already clear from the research summary that the analysis of testamentary documents, which we deal with in detail below, will largely focus on the content of testamentary legacies, it remains to determine the legal framework that normalized the validity and content of this type of testamentary record. Testamentary records, legacies are a frequently used institute in testator's wills in medieval Croatian coastal cities. The development of testamentary legacies, as Ravančić points out, began during the social and economic development around the 13th century, and the form of the record rested mostly on the provisions of the Roman, Byzantine, Lombard and Slavic traditions.[22] It is interesting to

[15] 1723: 41, 1729: 26 of the Tripartite. With regard to the formalities that were particularly relevant to the validity of the will, it should be noted that heirs or legatees should not have witnessed the will. Putz, C., (1870,) System des ungarischen Privatrechtes, Manz, p. 338., Kaser, M., (1975) Das römische Privatrecht, Zweiter abschnitt. Die Nachklassischen Entwicklungen, C.H. Beck'sche Verlagsbuchhanlungen, Munich, , § 286, p. 495

[16] According to § 578 of the ABGB, the person's written will had to be written and signed by the decedent in his hand, indicating the date and place of making the will. According to § 579, a will written before another person had to be signed manually by the decedent in the presence of three witnesses who had to indicate their signature both inside and outside the will. If the decedent was illiterate at the point of signature, he had to put a sign of his hand.

[17] The decedent had to make an out-of-court oral testimony in the presence of three witnesses, and the court one, regardless of whether it was pronounced or not, orally or in writing. The oral was handed over to the court for the record, while the writtn one had to be submitted to the court for safekeeping after having been written and signed by the testator. §585 and 587 of ABGB.

[18] In Roman law, codicil was a small letter attached to a will drawn up in an informal manner in a pleading tone with messages or pleadings to the heir or legatee not contained in the will. Romac, A. (1994), Rimsko pravo [*Roman Law]*, v. Ed., Narodne novine, Zagreb, § 395.

note that the analysis of testamentary legacies during the Middle Ages boils down to two manifestations of these records, *pro anima* and *ad pias causas*. [23] The content, as well as the form, is often normalized by the provisions of the city statutory law.[24] Regarding what came to be the subject of inheritance in the form of legacies, Ladić notes that since the second half of the 13th century, the testamentary disposition of the Dalmatian testator contained significantly more varied legacies than in the previous period when it consisted exclusively of land or money.[25] This change, Ladić believes, is a consequence of democratization in writing wills, which resulted in frequent testamentary dispositions in Dalmatian communes. In the continuation of the research, an attempt will be made to compare the legacies contained in the wills of the Osijek testators. Although the legacies are repeatedly mentioned in the provisions of the Tripartite Law, they were not addressed under any separate provision of that legal source. In Roman and so in medieval law, a legacy is a formal unilateral statement by a testator in which he is ordering the heir to transfer a right or an item from the value of the inherited property to the third party (legatee) from the property acquired by inheritance.[26] The legatee could not get into possession of the inherited item until it was handed over to him.[27] According to the contents of the source, the legacy could refer to the whole of the testator's disposition, to only one part of his disposition or to the legacy of a particular legatee. As the Tripartite Law does not regulate in more detail the issue of legacies, the elaboration of the provisions of the Austrian General Civil Code relating to the same issue will be used in continuation to clarify this legal institute. The testamentary institution is very precisely regulated by the provisions of the ABGB. According to § 647 of the ABGB, a legacy or testamentary record was only valid if left by the testator who was able to leave a testament to a person capable of inheritance.

[27] The meaning of the provision is to be found in the provisions of Roman law which prevented the legatee from retrieving things until the debts of the legacy were settled.

Accordingly, the legacy is the burden of the heirs in proportion to the size of their hereditary part.[28] Legacies could be items, rights, but also certain actions and practices that had value. In case there were more items of a certain kind in the legacy that were not closely specified, it was on the successor to make the choice of items to be handed over to the legatee. On the contrary, if there were no items in the legacy that were the object of the testator's record, the record would lose its value, i.e. the heir was not obliged to provide it. The same was true in the case where the legatee acquired an item at some point before the testator's death.[29]

3. Content analysis of wills

Analysis of testamentary documents stored in the State Archives in Osijek, which will be accessed below will aim to be achieved in two different parts. The first part will analyse the testimonials stored in the State Archives in Osijek in the town records of the initially united Osijek municipalities, and then the Osijek municipalities, and finally, the analysis of the preserved testimony documents contained in the State Archives in Osijek contained in several books of wills. While the records of city municipalities, that is, later Osijek municipalities, were largely written in German cursive Gothic, their analysis was significantly simplified through published writings compiled by Stjepan Sršan for particular periods of history (1786-1794, 1794-1809).[30] The Osijek State Archives contains five books of wills relating to the period of the second half of the 19th century.[31] The boxes contain a plethora of wills that were largely written in German and, in terms of their contents, they did not generally bring anything special, since the testators left their property entirely to children, child or spouse and thus went beyond the scope of this research whose purpose was to determine the economic situation in the city at the end of the 19th century, but also the contributions of individual testators to the urban environment. For this reason, in this research there was included a detailed analysis of the contents of individual wills, which in their content referred to testamentary legacies of their authors for the benefit of the institutions in need or individuals in the city area. Although the research on this issue sought to cover the contents of the wills of the well-known citizens of Osijek from the mentioned period, unfortunately their wills were not found in a lot of archival material, i.e. books of wills related to that period. For this reason, we searched them within the inheritance items of the Royal Judicial Table in Osijek, but to no avail. Only the search of trust instruments, i.e. the documents on establishing of individual foundations in the city, indirectly referred to the wills whose legacies were the legal basis for their creation. To this end, foundations served as a significant source for determining the contents of wills, legacies, and thus economic opportunities in the city at the end of the 19th century.

4. Wills within the contents of the minutes of Osijek Municipality

The minutes of the Osijek municipality for the period 1786-1794 contain eleven wills and thirty-five legacy records. In almost all testamentary records, the testators disposed of for the benefit of their children, spouse or closest relatives with whom they most often lived in the same household. However, one record brings slightly different content.[32] Unlike the other testamentary records, the will on the basis of which such a record was made, although not preserved, certainly contained a legacy in favour of the testator's widow. Certainly, the purpose of the testator's record was to provide for the widow's economic insurance, who for some reason (the brevity of marriage or childbearing) was not his heir.

After the establishment of the free and royal city of Osijek, on August 28, 1809, the city administration also received first instance jurisdiction in its area. This first instance jurisdiction will be exercised by the city administration until 1848, when the separation of administrative and judicial affairs will have finally come.[33] After 1809, some hereditary legal cases of citizens are included in the special political and economic records of the city government. The minutes are written in Latin, and the contents of those relating to the wills can only be noticed on the notice that a testament has been received and that its contents will be determined after the death of the testator. In the period to which the minutes relate, no wills were retained that would indicate the economic circumstances of the citizens, since they generally did not contain a list of the property of the testator but only an indication that the entire property was left to a specific heir. In order to understand the content of the wills, and especially the legacies for the benefit of public institutions or individuals, which will be analysed below, it is useful to briefly explain the social circumstances in the city in the period to which we refer. In the mid-19th century, Osijek was a true cultural, religious and educational centre, not only of Slavonia, but also of the area from southern Bosnia all the way to Buda. Summarized data from the 1815, 1817, 1820, 1830, and 1840 censuses were used to write this review.[34] According to Osijek statistics and censuses, the male population was divided into the economically active part and children. Accordingly, economically active men were divided into these four groups: clerks, citizens and craftsmen, servants of nobles, resident tenants (*inquilini*), and domestic servants of ambiguous positions. City statistics from the first half of the 19th century show that the most important group of Osijek residents was "citizens and craftsmen", of which as much as 27% of adult men were in 1830. This section of the civilian population held economic power and greatly influenced the political power in the city.[35] Among the citizens of Osijek, the leading position

[32] It is about the record no. 56, May 25, 1791. The minutes were drawn up before the City Magistrate in the presence of five witnesses. In the above case, it is probably the fulfillment of the will by which Thimotheus Vukovich, the heir of the late brother Simeon Vukovich, undertook to pay the amount of 2000 Fl. Anni, nee Baich, to the widow of her late brother.
The sum was to be paid every year until her marriage (from Georgyevsky Washar 791 to 793). After marriage, the amount had to be reduced to 120 Fl and paid until the amount of 2000 Fl had been paid. Sršan, S. (1996) Minutes of the Municipality of Osijek = Prothocollum des Stadt-Raths zu Esseg: from 2 December 1786 to 1794: for the 800th mention of the names of Osijek, Osijek., p. 195

was held by traders, among which Orthodox and German traders stood out.[36] On the basis of the social composition of the population of the city of Osijek in the first half of the 19th century, it can be concluded that the city of Osijek was an important trade and fair city, where six weekly fairs were held.[37] The period from 1809 to 1849 in the development of the city of Osijek is most significant for its economic, urban and social development, because despite all the problems that shook the Monarchy in those years, Osijek was developing at the fastest pace in the entire post-Turkish period. After the revolutionary turmoil of 1848 and 1849, this situation changed significantly. Namely, with the imperial patent of March 4, 1849 there was issued for all crown lands, except the Military Frontier, an octrated state constitution that abolished the feudal system and regulated the foundations of governing the state. This constitution legitimized the new social order in the country, that is, through various administrative reforms the modern civil administration is started to be built within another and different system of economic and thus political relations. Osijek's geopolitical position had a dominant influence on the city's development, and until the mid-19th century Osijek was the largest economic centre in Slavonia and Croatia. At that time, Osijek was a large market, where the process of industrial development and the establishment of monetary institutions began. The city of Osijek was one of the largest and most economically developed cities in Slavonia and Croatia since the second half of the 19th century, as evidenced by the intense activity of the Chamber of Commerce and Crafts and the opening of significant industrial plants. These are all reasons that also influenced the social composition of the population of the city of Osijek. [38]

5. Collection of wills

The second part of the nineteenth century is a more fruitful period in the area of Osijek when it comes to testamentary inheritance, which can be deduced from a very rich collection of testamentary documents preserved in five separate boxes in the State Archives in Osijek. In this part of the research, the most prominent wills will be analysed with regard to the set object from the beginning of the research and the trust through which it was possible to reconstruct the contents of the wills of prominent citizens who contributed to the economic circumstances of the city. It is interesting to note that the wills analysed below have a dual purpose. On the one hand, they indicate the material status of the testator, and contain details of the inheritance and economic insurance of loved ones even after the testator's death, while on the other hand,

---

[36] In the first half of the 19th century, the most populous group of adult men in Osijek were inquilini (resident tenants) and domestic servants of ambiguous position. The following data tell us this: in 1815, there were 60% in this group; 1817 - 69%, 1820 - 56%, 1830 - 69% and 1840 - 74% of working-age men. Based on these data, it appears that as many as 56-74% of the population in the City of Osijek were poor during the period. Part of that poor was earning a salary in the silk manufactory, transporting merchandise, in a brewery or in agriculture, and as servants in crafts. Bosendorfer, J. (1942): *Structura novae Domus Curialis. Construction of the New County House* 1834-1836, Proceedings of Osijek, No. 1, pp. 37-44;

[37] Bosendorfer, J. (1910): *Sketches from the Slavonian history*, Tiskom J. Pfeiffera Osijek, p. 589.

[38] Employed in the crafts and craft sectors, around 37 to 40%. Szabo, A. (1996): Socijalni sastav stanovništva *[The Social Composition of the Population]*, in Martinčić, J., ed.: Od turskog do suvremenog Osijeka *[From Turkish to Modern Osijek]*, Tiskara Meić, Zagreb, p. 160. It should also be noted that the established data of the employees in crafts to employees employed in the factories of Osijek at that time (for example, a glass factory, a match factory, etc.). The second largest group of citizens in Osijek are those employed in trade and monetary affairs (prominent merchants and entrepreneurs, their auxiliary workers, and clerks at Osijek money institutions). The fact that the city of Osijek had a developed economy, banking, etc., is supported by the fact that until the beginning of the 20th century, only more than 10% of the population were employed in agricultural affairs (owners of land and estates, tenants, family assistants, economic servants and farm workers). The number of employees in public services and the liberal professions was about 7.50% of the population, with about two dozen women employed. NRPŽ 1880, PSU VIII / 1882. - Some results of the census of 31 December 1880. Number of citizens, households and livestock. Publications of the Statistical Office of the Land Government of the Kingdom of Croatia, Slavonia and Dalmatia VIII / 1882, Zagreb, 1882.

they are valuable material for establishing the testator's piety as well as their social sensitivity. Not infrequently, wills are an integral part of a marriage contract, so it was necessary to pay attention to them, which is confirmed in two separate cases. The first case is just an example of a marriage contract and a will[39], while the second case is much more interesting from the point of view of this research. The case file[40] consisting of the marriage contract was subsequently added a will to which he had committed himself by the marriage contract, by which the testator departs from the disposition in case of death. This discrepancy is especially important given that the testator, who had no children in the marriage, decides to leave some of his property to the Serbian Orthodox Church. Despite efforts to ascertain the exact contents of this testamentary record, due to the dilapidation of paper and handwriting, it was unfortunately not possible. As the record lacks individualization of the real estate or currency, it is highly likely that this case was about disposition of movable property. Legacies of a religious nature to which the testator most often endowed the parishes or churches which they belonged to were often contained in wills made between 1850 and 1890, while later wills more often contained legacies of charitable content, which can be clearly read from the contents of the wills below. Religious legacies in the area of Osijek in the period under review are substantially different from the legacies that characterized the wills in the area of medieval coastal cities.[41] While the wills of the Middle Ages sought to express their feelings for death and the desire for eternal life in Paradise by stating the terms *pro remedio anime sue, ad pias causas* and *pro anima sua*, the testators of Osijek sought to show how exemplary believers they were by sharing, at the time of death, their property for the purpose of ensuring the functioning of the religious community. However, it must be emphasized that religious legacies are extremely rare in the period we are referring to, and the content of the wills of only wealthier citizens. For this reason, we are listing them almost completely below. The will of Mathias and Katarina Hegedušić is the most detailed account of the disposal of all property in the event of death, stating that the testator who later dies has the right to enjoy the property covered by the will for life. It was only after the death of the last testator that the assets could be distributed to the heirs. [42] Much more relevant to the content of this research is the testimonial record itself, which states in point 2 that the testators leave the parish church of the upper city of St. Peter and Paul the sum of 1000/6, and in point 3 the city hospital 30/6, and the chapel of St. Ana 20/6 of the value of the bequest, noting that the above amounts are to be paid after the decedent's death. Furthermore, the testator left the pre-legacy, worth 800/6 of the property, plus 300/6 in

---

[39] It is a marriage contract made between Pavle Bire and Ana Blind, a widow with two male children from a previous marriage, concluded July 11, 1860. The contents of the contract state that in the event of death of the bridegroom, the bride and her children must inherit the property under house no 14 in Jošava, and the bridegroom'a daughter from his first marriage, must be paid the sum of twenty forints, since she received her hereditary part at the time of marriage. HR-DAOS-123, box 524. Collection of wills 201-2015, no. 279

[40] In the second marriage contract concluded on September 4, 1856, the bride Anna Gjurjevic contributed to the marriage community 2400 forints in silver and 1000 forints in cash and 800 fl from the obligatory relation. In the event of her death, the amount of 2400 fl will go to the bridegroom. The bridegroom Ivan Ljubliš brings a house and shop in the upper town and in the event of his death, his property will belong to the bride. In the continuation of this agreement, the parties state the modalities of inheritance if there are children in the marriage, as well as the method of division of common property acquired during the marriage. HR-DAOS-123, box 524, Collection of wills 201-2015. In the same file, without the designation of the case number, is the will of the testator, Ivan Ljublish, written on May 17, 1859.

[42] The will was made on September 21, 1863. The heirs were named in detail as was the size of their hereditary part. HR-DAOS-123, box 524, Collection of wills 201-2015, no. 329

silver coins to Julia, Ferdinand, Hugia, Maria and Guslika Sehems - the children of the late Eva Sehems, formerly Mežnik. [43] Furthermore, the will of Eleonora Koller, nee Kolognat, also contained a testamentary record, a legacy for the benefit of several persons. [44] The contents of the will clearly identify charitable but also religious purpose of the gift. The testator left a note to the City of Osijek stating clearly that the City Government should treat the listed properties as a legacy. The subject of the legacy in this case is a house in the new part of the city (*Novi grad*) under house number 119, and the money obtained from its sale is to be used for a childcare facility. Furthermore, from the sale of houses in Kolhofer Street no. 93, 94, 95 and 96 the city had to pay 2000 forints for education of the four daughters of high school teacher Čičigoj, and 400 forints to Leo Vetter. The City Catholic Parish Church and the Franciscan Church were paid 100 forints, the church in the Cemetery of Osijek Tvrđa 200 forints, and the rest of the value was used to establish a trust fund for poor students of high school and girls' high school, for a care centre in new part of the city (*Novi grad*) and for the poor of Osijek. This will is unique in its content. The testator encompassed all three socially disadvantaged categories, which appeared as objects of legacy in Osijek wills from the observed period. The reason for such a disposition certainly lies in the more favourable economic circumstances of the testator compared to the testator below. Felix Ježević's testimony, written on October 6, 1893, contained two-point will. [45] As the sole heir to the entire estate of the deceased testator of the "Municipalities of the Free and Royal City of Osijek", the testator obliged the City of Osijek to fulfil the legacy according to which the city was obliged to establish a foundation for the founding of orphanage of 23 pieces of Austrian paper rent in the nominal value of 1000 forints. This legacy is of a charitable nature, and the testator recognized relatively early the need to establish a shelter for abandoned and careless children, which so far sought to be organized within other social welfare institutions. The will also includes a second legacy under which Johanna and Katharina Bohuš must be paid an annual rent of 100 forints while living or until married. This legacy is of a private nature, so it is of no particular importance to the content of this research. The legal heirs sought to challenge this will. This circumstance confirms the great value of this gift. In the end, a settlement was reached between the heirs of the testator and the city of Osijek, according to which the legacies of the will were left without changes. An integral part of the will of Josip Krausz, one of the members of the Josip Krausz Sons Company, is the legacy by which the testator obliges the City of Osijek to establish the "Joseph Krausz Foundation for Gifting the Poor of Christian Religion in the City of Osijek". [46] It was a principal of 6000 kronor or 3000 forint. [47] Likewise, Clara, the widow of Riffer, in her will dated March 25, 1869, wrote a legacy stating that the city of Osijek was bequeathed 1,000

---

[43] *Praelagatum* is an institute defined in § 648 of the ABGB: "… in the event that a testator assigns a record to one or more heirs in respect of that record, they are considered to be the legatees." More about praelegatum in Ehrenzweig, A., (1924) System des oesterreichischen Allgemeinen Privatrechts, 2nd Band (6th Aufl. des von L. Pfaff aus dem Nachlasse des Josef Krainz herausgegeben Systems des oesterreichischen allgemeinen Privatrechts) Wien, § 517, III.

[44] The will is not in the collection of wills for the relevant period, but the contents of the will can be determined from the contents of the Decision of the Royal Judicial Table in Osijek of October 11, 1890. no 6977. to whom the court shall send a copy of the will to the City of Osijek. Sršan, S. (2007). Records of the City of Osijek for 1887-1895, State Archives of Osijek, Osijek, p. 319. The contents of the will are also contained in the trust instrument establishing the Eleonora Kollar trust fund. HR-DAOS-6, corner. 6412th

[45] Writing off of the High Royal Land Government of December 24, 1899 no. 79,722. Osijek City Representative Case, April 27, 1899, no. 80. Sršan, S. (2008), Records of the City of Osijek for 1896-1901, State Archive in Osijek, Osijek, p. 496-498.

[46] The will was drawn up on January 22, 1891 and written in German. The contents of the will are part of the trust instrument: HR-DAOS- 6, box. 6402, no. 1732.

[47] In detail, the principal consisted of six pieces of 4% of the Hungarian crown annuity from December 1, 1892, number 522.155, 522.156, 5222.157, 522.158, 522.159, 5222.160 per 1000 crowns for a total of 60000 crowns or 3000 forints. The trust fund was founded on December 24, 1894.

crowns, i.e. 2000 forints to establish a foundation for the poor of Osijek. The foundation was managed by the Osijek city administration in such a way that the choice of four needy poor people had to pay the interest from the said foundation for the rest of their lives. After their death, the government had to name other poor people. [48] However, not all foundations in the City of Osijek that were primarily focused on helping the poor were founded on testamentary legacies. An economic need that was clearly more comprehensive than the others cited in the content of the analysis of particular wills was also sought to be met by the constitution of foundations on behalf of certain prominent and deceased individuals. Thus, the Countess Marijana Normann, born Prandau, in memory of her father, deposited in the Osijek city treasurer 5,000 forints to establish a foundation named "The Foundation of Baron Gustav Prandau for the annual gift of the poor communes of the upper town of Osijek on May 23, on the day of his death." [49] Likewise, Leopold Blau handed over 500 forints to the city government to establish a scholarship foundation for one poor student born in Osijek, regardless religion, who proved successful at school. [50] Only one of the many wills that contained the records clearly listed three hospitals as recipients of the foundation's wills. It is the will of Jovan and Marija Trandafil, drawn up in Osijek, on June 24, 1860. Point 6 of the will states that the proceeds from the sale of the two properties in Osijek should be distributed in three equal parts, "... to the Osijek hospital, the hospital in Novi Sad and the hospital in Sombor." [51] More foundations were established on the basis of the testator's legacies for the purpose of assisting in the education of needy students, but this was not the case when setting up foundations to assist the poor. It can be concluded that the education of young citizens and residents of the surrounding areas at the end of the 19th century was clearly neglected due to the economic disadvantages of their families. In order to improve the education rate of young citizens, testamentary legacies with a primary educational purpose replace those that have played a purely charitable role in the previous period. Most foundations established in Osijek in the last decade of the 19th century were largely created with the aim of helping poor students in their education. One of the well-known citizens of Osijek who is the founder of many foundations in the city, from those for helping the poor to those who supported the education and education of those who could not afford it, is Lorenz Jäger. In the will of Lorenz Jäger, dated 10 August 1887, a well-known Osijek wholesaler there is a legacy by which the testator obliges the City of Osijek to establish the "Striftung des Lorenz Jäger" Foundation for the establishment of three new foundations under order number 24, 25, 26 in the welfare institutions of the free royal city of Osijek. [52] The principal amount specified in the record is 10700 forints. Thus, by the will of Josip Brešević, a former canon of Đakovo, written on January 23, 1826, the municipality of Osijek received as a legacy an amount of four Hungarian gold rents, that is, 900 forints, to establish a foundation for diligent students of the Roman Catholic religion at the royal high school in Osijek. [53] In her will of January 24, 1885, Adela Horning left a principal

[48] The contents of the will relating to the legacy is part of the trust instrument establishing the trust fund on November 28, 1894. HR-DAOS-6, corner. 6402, no. 1,733

[49] The trust fund was founded on September 18, 1885, HR-DAOS- 6, box 6399, no. 1717.

[50] The trust fund was founded November 5, 1880 HR-DAOS- 6, box 6399, no 1721.

[51] The legacy consisted of a house in Count Khuen Hedervary's square no. 5 and the house in Šamačka Ilica no. 25. The sale of the two properties resulted in the sum of 24 900 crowns, which was attributed to the Jovan and Marija Trandafil Trust Fund for the city almshouse. "HR-DAOS-6, box 6403, no. 1741.

[52] The content of the will referring to the legacy is a part of the trust instrument used to establish a Trust Fund on November 18, 1891. HR-DAOS- 6, box 6403, no. 1743. Lorenz Jäger also founded a foundation for the poor, but the amount he donated for this purpose, 20,500 forints, is not an integral part of his last will, but a donation made during his lifetime. The foundation was named "Lorenz Jägers Stiftungs für Mädchen Haisen Haus" and supported 11 girls from an orphanage in their education. HR-DAOS-6, box 6403, no. 1738.

[53] The will was written in Latin, and the testamentary legacy is a part of the trust instrument. The trust fund was founded on March 26, 1895. HR- DAOS- 6, box 6402, no. 1715.

of 8760 forints for the establishment of the "Josip and Jelisava Horning Scholarship Fund for the Poor Good Students of the Osijek Higher Secondary School," based on the will of legacy. [54] The foundation with a very unusual purpose was founded by the merchant and industrialist Jacob Sorger by a legacy in his will written on October 30, 1896.[55] The high amount of 10,000 forints served to establish the Jakob Sorger Foundation for the poor fiancée of his immediate family, or for the poor fiancée from the city of Osijek. The income of the foundation was to be given as a dowry to a poor and unmarried girl who, from her ancestry came from Jacob Sorger or his wife, if she married with the consent of her parents. This record also defines the degree of kinship that a girl must have in order to be eligible for payment from the foundation.[56] The purpose of this legacy is also charitable, and endowment in this case points to a special category of girls that needed to be economically secured to enable her to participate actively and equally in marriage and family formation. As the testator in the record excluded all recipients of a further degree of kinship from the testamentary one, it could be concluded that the legacy was written for the benefit of a specific female person in need of this type of insurance.

6. Conclusion

Based on the analysis of available archival material, wills as well as records of the competent city authorities for hereditary legal issues during the 19th century, the conclusions of the research can be made from several different aspects. The testamentary disposition of property was often used by the institute in the late Middle Ages, as evidenced by the provisions of city statutes that clearly specified the matter. Thus, the formal and legal content of the wills was largely conditioned by the content of the statutory norms as well as the legal provisions of the Tripartite, and the formal requirements regarding the content and validity of the wills did not change significantly after the Austrian General Civil Code came into force in 1853. In terms of contents of wills and testamentary records, significant discrepancies are evident mainly after 1853, not conditioned by changes in the legal framework, but by changed social and social circumstances in the city area and the economic status of the testator. The city of Osijek has been one of the largest and most economically developed cities in Slavonia and Croatia since the second half of the 19th century, as evidenced by the intense activity of the Chamber of Commerce and Crafts and the opening of significant industrial plants. Economic growth also changed the economic position of some prominent citizens, who often contributed to different social needs through disposals of death. For this reason, charitable testamentary legates for the benefit of various public institutions for the purpose of empowering the needy in the second half of the 19th century replaced those who previously had a purely religious component. The testamentary legacies of the late 19th century marked a much more pronounced need to empower the educational role of the younger population, which is why wealthier citizens founded foundations in their wills for the purpose of scholarships for distinguished students. It is surprising, then, that only one testator recognized the need to strengthen the city hospital or

DESTINATION BRANDING: MEASURING TOURIST PERCEPTION OF DESTINATION BILJE, EASTERN SLAVONIA

ABSTRACT

Creating and branding a tourist destination includes a visible external display of all tangible and intangible elements. In recent years, the goal of tourism content trends has been to transform Croatia into a tourist destination that offers more than a family vacation, and more than sun and sea. In such circumstances, the removal of a number of developmental constraints remains an essential factor in the success of tourism development according to the master plan and strategy of tourism development in the Republic of Croatia until 2020. As Slavonia faces challenges such as unemployment, lack of content and programs of active, cultural and ecotourism, poor visibility and promotion of the region - tourism can become the key for the development of Eastern Slavonia. This paper analyzes what factors are necessary for establishing a stronger tourist identity of tourist destination in Slavonia: Bilje. As an ecotourism destination, Bilje is increasing the number of tourist arrivals and overnight stays, but it has to enhance cross-sectoral and cross-border cooperation with that and, thus, improve the overall socio-economic situation in the region. The aim of this paper is to research the perception of the tourist offer of Bilje as a tourist destination, to examine the views and opinions of potential and actual visitors on the offer, and to examine the level of satisfaction with the tourist offer. Research goal is to find out to what extent are respondents familiar with the tourist offer of the municipality of Bilje and its visual identities with the aim of improving the tourist offer by creating different visitor profiles. The methodology used considers the basic principles of destination management that imply the development of new, innovative ecotourism contents, programs, products, and infrastructure visible through numerous tourist products.

Key words: Bilje, tourism, perception, destination branding.

1. Introduction

Tourism has become one of the trends which millions of individuals access every day. Namely, tourism as an economic activity defines two basic types of participants: tourists – who are enjoying the benefits of tourism, and the tourism workers who use it as an economic activity for achieving income. The goal of branding a tourist destination is to emphasize the importance

of the image of the destination. Marketing strategy of observed Municipality in paper - Bilje is based on a clear mission and vision on balanced tourism development. It aims to establish the preconditions for attracting as many visitors through the Municipality's attractions and the region itself through the utilization of the area's natural resources and infrastructural value. Consequently, the topic is important because nowadays eastern Slavonia is trying to be more relevant on European continental tourist market. Tourism can have a positive effect on local economy through the strategy of quiet export where, using the tourist offer, products offered by the domestic country offering the tourism service can be placed. That way, tourism becomes a distribution channel of products that also promotes products from the tourist destination where it works. That is how tourism expenditure enables the engagement of all other economic activities which can flesh out the tourist offer. A key element in this case are marketing activities which have a significant role in the tourist activity, given that they present a key component which enables the creation of polygons for the aggregation of other activities with the aim of encouraging economic activities. The tourist potential of Croatia as a tourist center is marked in the ever-growing number of tourist arrivals, as well as numerous manifestations through which tourism business subjects offer products and services. Tourism, thus, becomes the carrier of product sales and export. Starting from the existing characteristics of the Croatian tourist-attraction offer, ten key product groups were defined on which the system of Croatian tourist products is supposed to be built until 2020. Product groups and strategies which are important to highlight for the needs of continental tourism are (Tourism development strategy of the Republic of Croatia until 2020):

- Cycle-tourism
- Eno and gastro tourism
- Adventure and sports tourism.

The tourist products being developed within continental tourism are precisely within the frames of the aforementioned product groups. That is why contemporary tourism puts an accent on services in order to reach the consumer/tourist, thus enabling an easier access of their products to the market. Tourist satisfaction has been considered as a main tool for increasing tourism destination competitiveness in the globalization conditions (Pavlić, I. et. al. 2011. 592). The strengths and benefits of the Republic of Croatia as a tourist destination are diverse – from the richer natural resources to geographical diversity and extremely valuable cultural monuments and tradition. The result of the aforementioned presents a diverse tourist offer, which is the basis for further marketing activities with the aim of developing tourist products and services. As one of the most interactive economic activities, tourism has improved significantly since the Internet allowed customers (travelers) to look for and create their trips without the need to go to a travel agency (Erceg, A. et. al. 2020). With advances in mobile technology, the emergence of wearables and "the internet of things" will accelerate the convergence of mobile tourism (m-tourism) to create a social, local, and mobile technology for the travel industry (Liang, Sai, et al. 2017, 732). The rich cultural-historic heritage implemented in the tourist offer expands and attracts various groups of visitors. Precisely such projects, combined with various marketing strategies, create new forms of tourist offers, which will result in the creation of a competitive and desirable tourist destination.

2. Tourist trends

Tourism is a dynamic phenomenon, which changes along with other social transformations (Monaco, S. 2018; Romita, T. 2000). This definition presents tourism as an economic activity that defines participants taking part in tourism development – tourists i.e. travelers. Considering the place of stay of an individual, there is a tourist destination, area of concentrated tourism

offer resulting from increasing number of visitors. Definition of the mentioned terms leads to a conclusion that tourism has become one of the trends joined by millions of individuals on a daily basis. One of the oldest definitions of tourism is that tourism is the sum of the phenomena and relationships arising from the travel and stay of non-residents, insofar as they do not lead to permanent residence and are not connected with any earning activity (Marković & Marković, 1967, 10). According to Ružić, tourism is not nor can it be a separate economic activity, as the needs of travelers as well as other travelers are met through aggregation of several activities (Ružić, 2007, 32). Based exactly on the abovementioned definition, tourism must be observed as a dynamic phenomenon susceptible to strong oscillations, that is, together with the simultaneous development of technology in the constant change of trends. The tourism development trend is based on giving tourist a feeling of authenticity through the notion called "the tourism of experience" i.e. a gathering of interconnected and intertwined emotional elements tied into a suitable destination tourist arrangement in such a way that they give the consumer/tourist a special experience (Jurin et. al. 2016, 8). According to Pellešova tourism is not only the cause of the processes of globalization, it is also affected by them. New tourism markets are emerging which change the notions of demand's existence (Pellešova, 2020). The profile of current and potential visitors is changing qualitatively. Travel customers now want and expect reliable information to drive their decisions, and these are increasingly focused on price, innovation, willingness to take active holidays and to travel to places with diverse and exclusive tourism products (Costa et al. 2016, 621). It is necessary to take tourism trends into considerations in the development of selective forms of tourism. Some of the trends of contemporary tourism demand are (Silvar, 2012, 23):

- Shortening vacation time i.e. strengthening the trend of short trips
- Strengthening the ecological awareness of tourists
- Tourists are searching for authentic experiences on their trips
- Tourists are educated beforehand on the tourist destination they will visit
- Tourists rely less and less on tourism intermediaries and book accommodations online
- Traveling is not planed overly soon because of the faster way of life and frequent changes of plans
- Image is becoming a critical element when choosing a tourist destination.

Some authors agree that trends in tourism are new experiences and a sense of history, authenticity and quality will shape the future of world tourism (Costa et al. 2016, 216). The basic elements of every tourist experience are: transport to the destination, the landscape, climate, population at the destination, accommodation, food and drink, entertainment, attractions and excursions. This assumes that the tourist experience of today is (Jurin et al. 2016, 8):

1. To a large extent individual
2. Subjective
3. Susceptible to change
4. Proactive
5. Interactive, meaning that it looks for authenticity and personalization in its design and delivery. This introduces the tourist experience into an intense dimension of empathy.

The result is that the contemporary tourist wants to be part of a tourist story in which he/she will actively take part i.e. that, based on his/her preferences, a tourist product is build which he/she can adapt for himself/herself. The marketing/management literature treats tourism experiences as consumer behavior, focusing on the consumer service experience, and recently, there is focus on co-creation of tourism experiences, especially in customer to customer

marketing (Quan & Wang, 2004; Rihova et al. 2018; Dodds, R. 2019). Given that the local level enables the highest degree of agility during the movement of new tourist packages, contemporary trends which put a focus on the relationship between the host and tourist, as opposed to just a tourist visiting a destination, can be adapted on local levels.

3. The possibilities of Slavonia's tourist offer

Considering the tourist potentials of continental tourism, in the future, the basic aim of development for Croatian tourism is a more even development of tourism for all its areas, including being equal to coastal part of Croatia (Tourism development strategy of the Republic of Croatia until 2020). Selective forms of tourism are an opportunity and a possibility of the tourist offer of Slavonia. The value of resources and the attractiveness of the space of Slavonia, primarily the Osijek-Baranja county, serve as the basic starting point for the development of tourism. From the aforementioned, the basic aims of tourism development are derived and those are – to achieve economic gain for its population while ensuring the necessary levels of environment protection, as well as rational use of natural resources. The integrated usage approach for the spatial-ecological, traffic, cultural-historic and human resources and "sustainable development" is a model to achieve the aforementioned goal (Report on the work and development of tourism in the Osijek-Baranja county for 2018). The measures employed so far are:
- Using the tourist offer based on natural resources (Kopački rit Nature Park, geo-thermal waters, eco-tourism, cycle-tourism, and other selective forms),
- Renewing and protecting the historical and cultural material and non-material heritage,
- Integrating various tourist offers with the aim of encouraging and developing all forms of tourism and
- Promoting and propagating continental tourism and inter-regional cooperation in designing the tourist offer.

The process of tourist valorization of the aforementioned may encourage and optimize the protection and keeping of values, differentiate and ennoble the tourist offer and achieve recognizability on the tourist market. Achieving synergy is based on building a culture of partnership, expanding cooperation between all participants and the intensive work on development projects through the development of tourist infrastructure, increasing the number of beds, intense cooperation with hotels, village households, tour operators and agencies (Gržinić et al. 2015, 38). The Osijek-Baranja county master plan has the aim of establishing a long-term strategic development framework and define the management-implementation guidelines of sustainable development of space and the aim which will contribute to further advancement of the quality of life of the local community and the further development of tourism and entrepreneurial activities.

4. Research on the perception of Bilje as a tourist destination

The paper focuses on the tourist micro-location – Bilje. The development of tourism in Bilje is connected to the preservation of natural beauties, cultural identity and the maintenance of ecological processes key for the bio-diversity of that area considering the proximity of the Kopački rit Nature Park. The entire tourist offer is based on cultural and natural values which have the potential for a recognized tourist destination. It is necessary to highlight that, in the previous years, there has been an increase in the accommodation capacities in all types of categories, ranging from rooms for rent, apartments, vacation houses, apartments with pools, hostels, and hotels. Travel and tourism research in past two decades and more have

demonstrated that a destination image among tourists is a valuable and irreplaceable concept in understanding the destination selection process (Prežebac & Mikulić, 2008, 163). The aim of research was to explore the perception of recognizability of the tourist offer of Bilje, to question the attitudes and opinions of potential and real visitors on the offer of Bilje and to question the level of satisfaction with the tourist offer. Furthermore, this research had the aim of finding out about the familiarity of the examinees with the tourist offer of Bilje and its visual identities.

The research was done on the appropriate internet sample of 178 examinees from the Republic of Croatia. Research was conducted during May and June 2019. The data was gathered by an online questionnaire in which examinees were familiarized with the theme and aim of research. The description of the sample may be seen in the following table:

Table 1: Sample description

		N	%
Gender	Male	71	39,9
	Female	101	56,7
Age	To 25	53	29,8
	26-35	48	27
	36-45	55	30,9
	46 and more	16	9
Highest level of education completed	Elementary school	1	0,6
	High school	50	28,1
	Professional study	23	12,9
	College or Art Academy	64	36
	Master's, Postgraduate or Ph.D.	34	19,1
Working status	Student	52	29,2
	Employed	106	59,6
	Unemployed	9	5,1
	Pensioner	2	1,1

Source: authors

From the total number of examinees (178), 86% of them visited Bilje at least once in the previous 12 months. Furthermore, a total of 36,6% examinees are familiar with the tourist offer of Bilje, while 19% of them are not familiar with it or are familiar with it to a lower extent. The rest of them, 44,4%, consider themselves to be mediocrely familiar with the offer, which is a significant indicator that the tourist offer should be better promoted. 73,2% of examinees are of the opinion that Bilje is recognizable by its intact nature, 72,5% the eno-gastro offer, and 41,2% by rest. On the other hand, the fewest responses tied to the recognizability of Bilje were connected to multiculturality (84,3%), authenticity (76,5%), and 71,9% examinees believe they are not recognizable by their hospitality. Considering their own experience of visiting Bilje, examinees described Bilje in the way stated in the following table 2. This table shows that examinees believe that Bilje is a recognizable tourist destination for all tourists, especially families and nature lovers, given that it provides natural benefits and contents connected to excellent cuisine and a relaxation in nature. The best proof for the aforementioned is the Kopački rit Nature Park which is most connected to the mention of Bilje.

Table 2: Bilje recognizability

For:	Baranja children cyclists family fishermen hunters lovers nature older Osjecani people tourists young
Because it provides:	beauty content delicacies ethnic food gastrotourism heritage holiday nature rest
Best proof:	Drava Fish Food greda Kopacki Kopackog park rit river zlatna

Source: authors

During their stay in Bilje, the majority of examinees (89,5%) visited Kopački rit Nature Park. 70,6% examinees visited a winery or a restaurant, and 66% of them stayed in nature. The aforementioned can also be seen in the following graph.

Graph 1: Content used during examinee stay in Bilje
Source: authors

Examinees were satisfied with the majority of content in Bilje, while they were neither satisfied nor dissatisfied with the availability of tourist information. They showed greatest satisfaction with the hospitality of the local population (73,2%), and they expressed the greatest dissatisfaction with the sports content offer (21,5%). The aforementioned can be seen in the following graph.

Graph 2: Satisfaction with the offer of Bilje as a tourist destination
Source: authors

If the examinees who never visited Bilje are observed (14%), 96% of them believe they are not familiar or are scarcely familiar with the tourist offer of Bilje. Even though they are not familiar with it, they believe that Bilje, as a tourist destination, is recognized by its intact beauty (56%), eno-gastro offer (48%) and relaxation (32%). On the other hand, all examinees agree that it is recognizable by multiculturality (100%) and authenticity and recreation (92%).

Research showed that there are certain contents which examinees feel need to be further developed and that it is necessary to put an emphasis on those during the creation of the tourist offer of Bilje. Out of the examinees who visited the place, 20,1% of them feel that there are further investments needed for new content which was not presented/showed/offered so far, 15% feel that Kopački rit Nature Park needs further investments, and 14,4% feel that the cultural-entertainment manifestations require them. On the other hand, examinees who never visited Bilje believe that an emphasis is to be put on the further development of restaurants and wineries (24%), Kopački rit Nature Park (16%) and other new contents which are still not offered (16%). It is visible that the current offer may now be "obsolete" and that potential and real visitors want some new content.

During informing about the visit to Bilje, examinees who visited the place state recommendations as the most frequent reason for visit (family, friends, colleagues) (76,3%), as well as a previous visit (41,4%). The least used sources of information are the Tourist community Bilje (7,9%), traditional media such as newspaper, radio, and TV (15,8%) and internet review platforms (17,8%). Preferred sources of information are websites of the destination/content/offer (63,4% examinees who visited and 52% examinees who haven't visited Bilje), Facebook (56,2% examinees who visited Bilje), internet review platforms (46,4% examinees who visited Bilje and 36% examinees who haven't visited Bilje), and YouTube (36% examinees who haven't visited Bilje).

In order to rate familiarity with the tourist offer of Bilje, and its visual identities, the examinees were asked how familiar are they with certain manifestations in Bilje and can they recognize the logo with a certain subject. The examinees who visited Bilje were mostly familiar with the Kopački rit Nature Park (73,6%), which was to be expected, then the Fishermen's days in Kopačevo (52,6%), the Slama land art festival (44,4%). 41,4% examinees are unfamiliar with the Kakasütés in Vardarac, and 29% with the Eugene of Savoy's Castle Day. If the examinees who never visited Bilje are observed, 36% of them are familiar with the Kopački rit Nature Park, 96% of them are unfamiliar with the Kakasütés in Vardarac, 84% with the Paprika Days in Lug, and 80% are unfamiliar with the International Ethnic Meetings in Bilje, the Eugene of Savoy's Castle Day and the Slama land art festival. In the logo recognizing portion of the questionnaire, the following logos were shown – the logo of Bilje, the logo of the Tourist Community of Bilje, Kopački rit Nature Park logo, Zlatna greda logo and Baranja logo. The majority of examinees recognized the Baranja logo (83%), which is understandable considering that it spells out the word "Baranja", 73% of them recognized the Bilje logo, 67% the Kopački rit Nature Park logo, 50,8% the Zlatna greda logo, and 48% the Tourist Community of Bilje logo.

4.1. Visitor profiles

Examinees who visited Bilje (82%) believe that it is likely they will visit again, which is an extremely good piece of data. The aforementioned can be seen in the following graph.

Graph 3 The possibility of another visit to Bilje
Source: authors

29,2% examinees will recommend Bilje to their friends and colleagues, 37,1% will not do so, and 19,7% will share their dissatisfaction. Based on that, the NPS[1] was calculated, which measures satisfaction and loyalty of a visitor/consumer of services and divides visitors/consumers of services into three groups:

---

[1] Net Promoter Score

- Critics (19,7%) – examinees who will not recommend Bilje to their friends and colleagues, are not satisfied with the offer and will share their experience with a third party
- Passives (37,1%) – examinees who do not speak to third parties about their experiences and the offer received
- Promotors/starters (29,2%) – examinees who will recommend Bilje to their friends and colleagues, mostly due to a high rate of satisfaction with the offer.

When creating the profile, a fourth group of examinees will be added, containing the examinees who haven't visited Bilje so far (14%). Description of the profiles is below.

Table 3: Profile description

Critics	The critics are mostly female, employed or faculty students, up to the age of 25 with a finished high school education. So far, they have visited Bilje several times and are not very familiar with the offer. They are most satisfied with the accommodation capacity, expressing great dissatisfaction with the offer of entertainment and sports content. In Bilje, they visited the Kopački rit Nature Park, went to restaurants/wineries and stayed in nature. The stay in nature, along with a bicycle ride, is the content where they would like to see further development. During informing about the visit to Bilje, they mostly used recommendations and the sources they prefer when gathering information are websites of the destination/content/offer, Facebook and internet platforms for reviews. It is highly likely they will visit Bilje again.
Passives	The passives are mostly female, employed, between the ages of 36 and 45 with a faculty degree. So far, they have visited Bilje several times and are mediocrely familiar with its offer. They are most satisfied with the accommodation capacity, gastronomical offer and hospitality of the local population, expressing great dissatisfaction with the offer of entertainment content. In Bilje, they visited restaurants/wineries, stayed in nature and visited the Kopački rit Nature Park. They wish to see further development in the Kopački rit Nature park and the discovering of some new content. When gathering information about the visit to Bilje, they mostly used recommendations and the sources they prefer are websites of the destination/content/offer, Facebook and internet platforms for reviews. It is highly likely they will visit Bilje again.
Promotors/ starters	Promotors or starters are mostly female, employed, between the ages of 26 and 35, with a faculty degree. So far, they have visited Bilje several times and are mediocrely familiar with its offer. They are most satisfied with the hospitality of the local population, while they show great dissatisfaction with the sports content offer. They visited the Kopački rit Nature Park, went to restaurants/wineries and engaged in recreation/walks. They wish to see further development in the Kopački rit Nature Park, as well as the discovering of some new content. When gathering information about the visit to Bilje, they mostly used recommendations, and the sources they prefer are websites of the destination/content/offer, Facebook and internet platform for reviews. It is totally likely that they will visit Bilje again.
Potentials	The potentials are both female and male, faculty students, up to the age of 25 with a faculty degree. They haven't visited Bilje so far and are totally unfamiliar with its offer. They wish to see further development in the Kopački rit Nature Park, their stay in nature and the discovering of some new contents. When gathering information about any destination, they prefer

5. Discussion - guidelines for branding

There are four factors which influence the brand value perception with a consumer: brand awareness; perceived quality level in comparison with the competition; the level of trust, importance, empathy and liking; and the attractiveness and richness of the image which the brand causes (adjusted according to, A. et al. 2015, 93). From the destination branding aspect, the brand represents marking the destination i.e. the gathering of all expectations, thoughts, attitudes, findings, feelings, promises and associations we "carry" in our consciousness about this destination. A growing likeness of tourist products i.e. tourist destinations pushes the need for destinations to create their own unique identity in order to differentiate themselves from the competition (Bienenfeld, M. 2019, 93). Certain authors feel that the more brand determinations are offered, the greater the brand relevance is i.e. there are more and more points of differentiation and creation of unique associations which are the basis for the differences in brand image (Keller 2008, Jakovljević, 2000, 22). We can conclude that branding a destination is a strategic tool for long-term planning of tourism and can be used well when formulating a strategy of market segmentation.

This research wanted to find out which attributes and guidelines can Bilje use in its communication as a destination. The examinees feel that Bilje is a recognizable tourist destination for all tourists, mostly families and nature lovers, because it provides natural benefits and content connected to excellent cuisine and relaxation in nature. The best proof for the aforementioned is the Kopački rit Nature Park which is mostly connected with the mentioning of Bilje.

Based on the analysis and primary research, the attributes on which Bilje can build its brand were defined:
- Diverse and rich cultural heritage, tradition, and folk customs
- Diverse traditional and cultural manifestations
- Diversity and specificity of micro-cultures
- Rich and diverse eno-gastronomical offer
- Creation of theme routes
- Restoration of ethnic houses in a private initiative
- Opening private museums and collections
- Attractive natural heritage
- Possibility of hunting and fishing
- The agricultural tradition
- Beneficial geo-traffic position
- Closeness of other destinations within the county
- Satisfying number of gastronomy objects.

We can conclude that the basic elements which define Bilje as a tourist destination are natural wealth and other Slavonian traditions. Taking into consideration the aforementioned elements, the following guidelines for branding which can be applied to the tourist development of Bilje may be considered:
- Design – the aim is to strengthen the value proposal of the destination for the setup of an attractive offer by designing an enticing brand for targeted guest segments. This

relates to icons, symbols, myths, and brand music; the development of Croatian commercial brands and markings

- Communication values – communication activities have the aim of informing guests on the "uses of a destination" and to strengthen the brand through media formats such as advertising or public relations. These initiatives pertain to encouraging inspiration at the destination/informing by way of more important websites; specialist tools and internet websites/content promotion etc.;
- Content delivery – delivering value to customers demands initiatives of creating effective distribution channels and an effective sales system.
- Initiatives of keeping guests – "The tourist chain of values" continues by defining initiatives designed to please guest expectations and stimulate pleasure and loyalty.
- Further support for the industry – the tourist industry demands support through initiatives which include transfer of technologies and knowledge.

In order to enforce the aforementioned guidelines for branding, a wide and general series of priorities, visions, and aims must be defined and enforced, based on which coordinated marketing efforts will be coordinated, which also happen to be the recommendations and guidelines for further research by the authors.

6. Conclusion

Taking into consideration the many positive effects that the development of tourism may have on the local and regional economy, this paper observes a case study on the example of the tourist micro-location and presents guidelines for the branding of Bilje as a destination, based on the visitor profile analysis. The source point presents a pairing of the existing product-service offer and a diversification of the offer through a trend of the demand for ecologically acceptable products and natural resources preservation. The result is achieving a long-term sustainable model of creating a tourist offer at the destination. By keep the local population through the creation of a positive entrepreneurial climate and more effective administrative procedures, the visibility towards emitting markets and target segments is achieve, which is also a systematic approach to the creation of a brand identity which is clearly connected to the destination attributes. This paper analyses the profiles of visitors and their perception of the aforementioned tourist destination, as well as the attributes which may serve for brand development.

Based on the critical trends presented and the discussions provided by the theme issue authors, it is possible to highlight strategic recommendations that can help destination management organizations and policymakers. The starting point is to identify key consumer markets and ways to communicate with them. Statistical data announce a global economic crisis; tourist destinations and tourism companies must tailor their offers to respond to trends from a global perspective. Recommendations for future research are to extend a sample of respondents in research from abroad. Collected data would allow seeing the perception of tourists from key broadcast markets and coordinate marketing activities necessary for destination branding.

The limitations of the paper is the fact that the efforts put in so far for the development of the tourist offer have not been analyzed, due to the fact that they are often the result of sporadic and unsynchronized activities primarily focused on the development of individual attractions which find their places in the total offer spontaneously. The consequences of such an approach affect the uniqueness and recognizability of the market approach in the ever more demanding and competitive environment. Another problem arising from such an approach is the lack of a clearly defined tourist program which has to be under the jurisdiction of the local unite in order to ensure the consistency of the offer. In such conditions, a clearer and more recognizable image of the destination which can then be identified with the communication elements of the brand

is much more likely. By including the local population into the stages of designing, guiding and enforcing all the activities of public action in Bilje is of critical importance. The local population must be familiar with the possibilities of its own contribution, as well as the aims of communication in the context of developing a tourist offer and a brand. The result will be visible through the development of new, innovative eco-tourist content, programs and products for specific groups, and it will ensure the movement from mass tourism to a more personalized and adapted offer.

MARKETING MOBILE COMMUNICATION OF COMMERCIAL BANKS IN THE SLOVAK REPUBLIC

ABSTRACT

In today's technology-oriented world, institutions need to attract the attention of their customers both in terms of price and quality technology in their products and services. Not only the level of technology, but also pricing itself has a very significant impact on the company's marketing strategy. Companies, including banking institutions, must compete for customers through favorable banking services, which must be comprehensive and meet all customer requirements. Usually, the services of banking institutions aim to satisfy the same or very similar customer requirements, so the level and speed of satisfaction of these requirements is often crucial. Commercial banks use their own mobile applications, the level of which is constantly improved and adapted to current customer requirements. These mobile applications are provided to customers free of charge, so in this case the choice of the bank based on its application is not the price, but the parameters that are crucial for the customer in this case. The main aim of this work is the analysis of mobile marketing in the banking sector in Slovakia. Another aim of the paper was to compare Slovak mobile banking marketing with foreign countries with a focus on mobile banking applications. In this work we used the methodology of mutual comparison and analysis of mobile marketing communication of commercial banking institutions. Based on the analysis, the criteria for the ideal mobile application of the Slovak commercial bank were made. At present, emphasis is on complexity, as customers require all services within a single application without the need for additional add-ons with the need to download further to their mobile device. Security is also very important, especially at this time when the misuse of personal data over the Internet is increasing. Other criteria critical to the customer are the speed and simplicity of such mobile banking applications.

Key words*: Marketing, Marketing strategy, Mobile marketing communication, Mobile app, Commercial bank.*

1. Introduction

Technology is moving the world, and therefore research is increasingly focusing on this area. This work is devoted to the field of marketing communication of banks in the Slovak Republic, and it is about communication of the bank with its customers through mobile

devices. The importance of this subject is steadily increasing as mobile devices are an integral part of almost every bank's customer life. Especially using mobile devices, bank customers often execute standing orders, pay their bills, transfer money to savings accounts, send money to each other or just check their current or savings accounts on an ongoing basis from the comfort of their home. There are several researches in this field and a very interesting work is the research of authors Kirakosyan and Danaiata, who deal with the issue of communication within the electronic banking. Their suggestions and observations to improve and simplify this communication are a constant contribution to this area. Similarly, research on the issue of young customers in the use of mobile banking by Grant and O'Donohoe is very important in this area. The authors address various obstacles to why young people may not be inclined to mobile marketing communications and, based on the knowledge of their work, many companies know what they should avoid when using mobile devices to communicate with their customers. There are several similar researches, each of which is beneficial in some part of the mobile marketing field, as well as the aforementioned research. The aim of the research is to analyze mobile marketing communication within banking institutions within the Slovak Republic. This analysis will be carried out by collecting data on mobile applications in banking institutions in Slovakia and subsequently this data and information are compared with mobile banking applications abroad. The expected outcome of this analysis and comparison is a set of specific recommendations and steps to improve mobile banking applications based on customer requirements and comparison with foreign banking applications.

2. Marketing Mobile Communication

Focusing companies solely on maximizing their profits today is not sufficient for market success. Companies also need to focus on areas such as the social and environmental interests of the public. The marketing strategy of companies must therefore be comprehensive. (Nadanyiova, Kicova, Rypakova, 2015, 223)

Focusing businesses primarily on profit is irresponsible to us and leads to a predetermined failure. The very existence of an undertaking is not based on the fact that its economic result is positive, the undertaking must also take into account other public interests and adapt its objectives and the objective of its existence to the current social requirements.

Valaskova and Kramarova (2015, 839) argue that it is equally necessary that companies have access to information that includes their exact requirements to meet customer needs. The country itself needs to be informed about events abroad in order to ensure the free movement of goods so that companies can trade abroad and meet the requirements of not only domestic but also foreign customers

Many authors and experts in the field agree with their statements, and we agree that the cooperation of companies with the state is possible, but only on the basis of the current database of customers and their specific requirements. That is why we believe that the state authorities must be informed in a timely and complete manner at this level.

For their positive development, companies must set up a marketing strategy within their strategic management that will monitor their interests and intentions. There are various ways and tools that can influence the marketing strategy. A summary of the different elements that can be used to optimize a marketing strategy is the marketing mix. (Kicova, Nadanyiova, 2015, 294)
An important part of the marketing mix is marketing communication, which is its fastest growing part. At the same time, it can be said to be its most perceived and visible part.

Through marketing communication, the company communicates with its customers, current or potential, and also strengthens its image and sales of products and services.

Innovations and modern technologies enable companies to use not only traditional but also modern communication mix tools. Companies should learn to combine these tools as effectively as possible. At the same time, innovative activity in this area increases the competitiveness of the market in particular. (Janoskova, Kral, 2019, 75)

According to the authors Rypakova, Stefanikova and Moravcikova (2015, 363), the effectiveness of individual communication tools is a constant issue, while the most effective way of presenting the target market is communication via social networks and, of course, oral advertising. Market segmentation is much easier to identify by marketing segmentation.

In today's world of rapidly and dynamically developing technology, many people cannot imagine their day without mobile devices. Technology is moving forward and customers' requirements are moving forward too. It is one of the most dynamic tools of modern marketing communication. Its integral and important part is a mobile phone. (Grant, O'Donohoe, 2007, 236) In our opinion, these tools include not only a mobile phone, but increasingly also an essential part of this device - a smart watch. Customers often use this watch even earlier and more often than the mobile phone itself.

Mobile marketing is a term that refers to one of the methods of direct marketing based on the use of mobile devices, such as mobile phones, smartphones and, less often, laptops. Technologies such as SMS, MMS, Bluetooth, WLAN and others are used to distribute commercial or non-commercial content. Thanks to the constant increase in the popularity of mobile phones, mobile marketing can be described as one of the fastest growing and precisely targeted communication activities. At the beginning, the concept of mobile marketing became known thanks to SMS-marketing, which is part of it. This happened after some Asian and European companies started collecting phone numbers and sending ads to it. (Marakova, 2016, 159)

In the case of mobile marketing, the possibility of an internet connection, which is already an integral part of it, cannot be omitted. Using browsers, social networks, searching for music and other information using smartphones is becoming increasingly popular. Also, downloading apps, games, music, or files is a big plus. In addition, the smartphone owner has the option to use different types of browsers that are customized for these devices. Likewise, websites are tailored to the resolution and size of the mobile devices themselves. (du Plessis, 2017, 43) We agree with the author's assertions, because the focus of customers on internet activities on their mobile devices provides companies with an almost unlimited number of connections and communication with customers, which is why the internet has opened up a large number of mobile marketing opportunities. However, it is up to the companies themselves how willing and able to use this opportunity today.

Among the features of mobile marketing can be the fact that it is personal, accessible, instant, global, portable, available in real time and personalized according to the wishes of the customer. It also allows the customer to escape from one place and expand the concept and the notion of time. (Marakova, 2016, 132)

A mobile strategy as a structure defines how different mobile tactics are used to achieve defined marketing goals and meet customer needs. These tactics can be, for example, mobile apps, mobile websites, and other mobile marketing communications tools. The main role of mobile marketing is to raise businesses' awareness by helping them get timely information about the requirements and preferences of their target customers in a profitable way. (Amirkhanpour, 2014, 2021)

Mobile marketing communication is important for all institutions, not excluding the banking ones. In general, all banking institutions should meet the needs of their clients in order to be able to maintain the pace of increasing competitiveness in the market. (Pakurar, Haddad, Nagy Popp, Olah, 2019, 17)

The constant increase in the number of mobile devices is the reason why, in our opinion, all institutions and companies will use the connection through these devices more and more often. We think that in the near future, mobile usage will reach a level that will surpass the use of laptops or computers, not just in the field of marketing communications.

2.1. Advantages and disadvantages of mobile marketing

One of the advantages of mobile marketing is that it is personal because the mobile device is very versatile and also has the advantage of being flexible and therefore does not need long-term preparation. Mobile communication supports and complements the remaining traditional forms of communication. Another advantage is the immediate measurability of individual campaigns. (Frey, 2011, 165)

Also, the advantage of mobile marketing over other communication mix tools is that the mobile phone population is 90%, reaching almost 100% in some countries, and these devices are often available 24 hours a day. Mobile phones have a myriad of features, and this number continues to grow with new features and applications. Mobile marketing elements can be used wherever there is signal coverage. At the same time, the advantage is that the most up-to-date information reaches the mobile internet rather than the print media. (Marakova, 2016, 154)

From our point of view, as a mobile phone user, a large number of applications on a mobile device are a real advantage, but often the incompatibility of these applications, either with each other or with the mobile device itself, is unpleasant and dissuasive for us. Also, in our experience, too many applications are too burdensome for a mobile device to limit its smooth functionality. That's why we consider apps that include several smaller apps or features as simplified versions of multiple apps in one.

One of the biggest advantages of mobile marketing is the portability of mobile devices. In addition, the best and most up-to-date content is mostly coming to the mobile internet rather than to other media. Mobile content can be updated much faster than with print media, for example. (Amirkhanpour, 2013, 2547)

The advantage of mobile banking can be seen as the effect of artificial intelligence within mobile devices and thus also the effect of some level of automation based on cognitive technologies belonging to the key trends in the field of intelligent industry. (Kliestik, Kliestikova, Hardingham, Vrbka, 2018, 16)

The advantage of mobile devices is generally relatively good marketability within the market economy. Care should be taken, however, to ensure that market conditions are met in which non-compliance would require additional trade negotiations. (Peleckis, Peleckiene, Peleckis, 2018, 75)

Just as mobile marketing has its advantages, it also has its disadvantages. The authors of the articles and literature mention various disadvantages of mobile marketing. The greatest disadvantage of many is the risk of misuse of personal data. We consider the greatest disadvantage of mobile marketing the escalation of time spent using a mobile device. In our opinion, this is not only a health problem in vision impairment or increasing headaches, but

also a loss of attention when using these devices, often in activities where it may be life-threatening.

Another disadvantage of mobile marketing is marketing workers who have no experience in this field, further incompatibility of various types of phones and the like. (Kirakosyan, Danaiata 2014, 367)

Limited and inadequate signal coverage in some areas is still one of the biggest disadvantages of mobile marketing. Likewise, the availability of an internet connection or data roaming are major disadvantages. Insufficient internet connection speeds and incompatible applications are also common problems. In our opinion, mobile operators should be able to provide coverage of almost the entire territory with a mobile signal and also with an Internet connection, and, according to models from abroad, provide these services at affordable prices.

From our point of view, the big disadvantage of mobile marketing can be considered its negative forms such as mobile spam, mobile hacking, various forms of SMS spamming and targeted sending of unsolicited SMS. In our opinion, one of the disadvantages of mobile marketing may be the interception and misuse of the information obtained.

2.2. Mobile marketing tools

The most commonly used mobile marketing tools include advertising SMS and MMS, SMS contests, polls and voting, mobile applications, advergaming, QR codes, location-based marketing and others. (Bozhkova, Ptashchenko, Saher, Syhyda, 2018, 76) We can confidently say that the most commonly used tools, among others, are the mobile applications we use every day.

Mobile apps - are programs installed on mobile devices that allow you to shop by mobile, get the information you need, or interact with social networks, relax and enjoy using games. Today, it is a widely used tool from the perspective of companies. (Kapoor, A. P., Vij, M., 2020, 106)

The use of social media for marketing purposes is already essential. No companies or institutions should underestimate this fact, otherwise these companies may not compete. Promoting mobile marketing and its tools through social media is therefore an effective tool to attract new customers necessary to maintain their market position. (Gavurova, Bacik, Fedorko, Nastisin, 2018, 79)

In our opinion, the number of ads on social networks should be limited not by a particular social network, but this restriction should be by law. Many mobile network users find the amount of marketing material annoying or unbearable.

The emotional aspect of mobile marketing cannot be omitted either. It's very important to focus on the customers with a mobile marketing tool that drives them to a certain emotional response. In the event that the marketing communication itself mediated by a particular mobile marketing tool has a certain emotional value or significance for them, so they can decide primarily on the basis of it. (Nadanyiova, 2017, 92)

Different marketing incentives need not only to trigger a positive emotional and cognitive response, but to identify and provide evidence of the impact of the specific mechanisms underlying consumer and behavioral neuroscience decision-making. (Drugau - Constantin, 2018, 48)

Many times, tracking and exploring behavioral aspects of customer decision making is key to developing mobile marketing communication tools that institutions try to adapt to the best possible customer requirements. (Valaskova, Bartosova, Kubala, 2019, 26)

Mobile marketing tools should be used by companies to attract new customers. However, in our opinion, companies often do not choose the right tools to communicate with customers, or even choose the right way to reach potential customers. Therefore, companies should make the choice and use of the mobile marketing tool after obtaining information about customer needs through appropriate market research.

3. Mobile marketing communication of banking institutions in Slovakia

In recent years, mobile marketing communication has seen a huge boom throughout the world, not just within the Slovak Republic. Mobile devices are increasingly used and the home market is no exception. Different institutions use forms of mobile marketing to promote their activities and attract supporters and customers. Banks are also making mobile communications more flexible and efficient. The contact of these institutions with mobile customers has become an essential part of the lives of a large part of the population. According to various surveys, people look at their mobile phones, tablets or smartphones much more often than they watch TV or their computers.

Quality perception is one of the decisive factors for customers to choose a particular banking institution to manage their finances. Equally critical is the quality of mobile marketing provided by these institutions. In particular, customers prefer an up-to-date offer, which is regularly updated based on current trends in mobile communications, as mobile technology and services in particular are moving very fast and therefore banking institutions need to adapt quickly to the market. Therefore, customers can divide individual institutions based on quality perception into different product categories, and this selection can also be based on the brand image and the bank itself. Customers often focus on the global origin of banks, that is, whether banks operate internationally, or whether they operate only domestically. (Bartosik-Purgat, 2018, 135)

Within the Slovak Republic, mobile applications of banks have seen a noticeable development. In the last 10 years, Slovak banks have simplified and upgraded their mobile application services. Many banks offered a large number of applications, each offering a specific service, such as an account overview. Another application used for electronic payments and the like. Today, banks use one complexbanking application that includes all the necessary operations. These applications are clear, simple and very well secured. The advantage is that the customer does not have to procure various applications for all necessary tasks, only one is enough. This is mainly about saving time, and it also does not overwhelm phones with unnecessary applications and does not reduce its performance.

Equally, the security and privacy of banks' mobile applications have visibly improved in recent years. You can use your fingerprint to sign in to the mobile app and confirm payments and transfers. Not only does the fingerprint help protect against the misuse of personal data and funds, but also a face or retina scan is a very effective and unsurpassed security feature. A common part of some banking applications is voice control.

In recent years, banking institutions in Slovakia have charged the service of SMS notifications that were sent automatically and free of charge in the past. Currently, SMS notifications are not sent automatically, only within confirmation codes when paying via internetbanking, and these messages are free of charge.

Within the framework of mobile banking, Slovak banking institutions are increasingly focusing on young people controlling news from the mobile technology world. It should be noted that loyal customers who have been using the services of the same banking institution all their life are no longer as skillful in using mobile devices as younger people. Thus, their loyalty is not based on modern and advanced technologies, but results from various demographic and psychographic aspects. It is imperative that banks focus on bringing this mobile world closer to higher age customers, as regular and loyal customers are equally important to the bank. (Gajanova, Nadanyiova, Moravcikova, 2018, 76) We think the simplicity of mobile apps is crucial in this case. Banking institutions should emphasize the increasingly simple and understandable design of their applications, bringing them closer to customers of higher ages.

4. Comparison of domestic and foreign mobile banking

Unlike banks in the Slovak Republic, banking institutions in the United Kingdom and the United States use mobile calls to verify customer satisfaction with their services, which is not the case in our country. Many times this act is considered harassment, but even the customers themselves take it as a way of improving services and trying to get their personal opinion. Also, English banks use QR codes much more often as a marketing communication tool to simplify their services.

Another big difference between our and other foreign banks is that they offer all services within the application demo versions available on the bank's website. It is only necessary to have activated mobile internet banking, which the customer can first try using the demo version. The client can thus try to use all available services without having to download them to their mobile device in the full version.

Banks in all countries have successfully adapted their websites to mobile devices such as smartphones and tablets. However, the difference in banking applications can be observed here. English and US banks provide these applications to a larger number of mobile operating systems. While Slovak banks only offer applications for Android and iOS (Apple), English and US also offer applications for BlackBerry and Windows Phone. This phenomenon is understandable, however, because these operating systems are not common in our country, but banks should also be able to use their applications to customers who have mobile devices with these operating systems.

Unlike the Slovak Republic, 24-hour telephone services are used in many countries within mobile banking, allowing customers to check their balances, make payments and transfer money via phone call. The customer simply dials the number and the assistant performs all tasks according to the customer's instructions.

Another mobile banking service that is frequently used abroad is that a customer can send money to a friend or acquaintance account only by their mobile number or other contact. Similar services are not provided within Slovak mobile banking. No account number or payee bank code is required. This will automatically send money to your account if you also use this service. If the recipient does not use this service, he / she will receive an SMS message stating that someone has tried to send money with an internet link to the application or with a link to his bank.

This comparison is based on the findings of the bachelor thesis of one of the co-authors of this paper. In the framework of this thesis, it was necessary to communicate with selected major banking entities operating abroad. They provided the data needed for comparison. This previous research was the basis for the research we did. Based on our experience with mobile

banking marketing in Slovakia, we have contributed to the knowledge of current tools used by banking institutions today.

5. Design of ideal mobile banking application

The design of the ideal mobile application is based on the knowledge presented in the previous section, which was based on the research carried out in the bachelor thesis of one of the co-authors. Based on the results of the comparison of Slovak and foreign mobile banking from this work, we conducted an up-to-date overview of parameters that are better or worse in terms of mobile marketing communication of Slovak banking institutions. In this way, with regard to the current knowledge in the field, we designed a mobile banking application that should be ideal according to the previous and this research.

Compared to the past, banking mobile applications are much better tailored to customer requirements and needs. The ideal mobile application of the bank should meet several basic parameters. It should be secure, so it must include the owner's identity verification of the app. Also, the app should require an identity confirmation for each payment transfer and order. Also, the ideal mobile banking application should provide all the services, without the need for the user to download additional applications to their mobile device. Simplicity and clarity are an essential part of a mobile application that would satisfy even the most demanding customers.

Based on a comparison with foreign banking applications, it would be appropriate for banking institutions in Slovakia to use demo versions of mobile banking applications. These demo versions would be offered to every current or prospective customer and provided free of charge. Customers could try using the apps and decide which bank they would like to work with in the future.

6. Conclusion

The design of the ideal mobile banking application must be taken as a guide, not a strict template. Slovak banking institutions should focus on offering applications that are comparable to foreign ones, especially in terms of quality and availability. Among the most important findings of this work is the fact that Slovak banks may provide high-quality and fast mobile banking applications, but they need to make their customers' work with finances within their applications as easy as possible. In particular, they should provide customers with the ability to use demo versions of these applications, simplify payments by securing QR codes, and enhance application security by identifying not by SMS services, but primarily by fingerprints, voice tracks or scanned faces or retina. The knowledge gained from this work can influence the development of banking mobile applications, especially when reducing the cost of market research and customer research. The results of the work also provide the information needed to build an ideal mobile application and determine the requirements for which the development and implementation costs can be further quantified.

BOOK ADVERTISING IN *NOVINE HORVATZKE*, THE FIRST NEWSPAPER IN CROATIAN LANGUAGE

ABSTRACT

When newspapers started their history on the territory of Croatia in the early 19th century, their potential in advertising was immediately recognized. Among advertisements for various products, goods and services, newspaper readers could also find book advertisements. Newspapers could best trace the rapidly growing production of books due to the shorter time needed for their printing than the bookstore catalogues that had been commonly used at that time. The main aim of the present paper is therefore to examine the extent to which printers, publishers, bookstore owners and authors used Novine horvatzke, the first newspaper in Croatian language, for advertising purposes. The selected book advertisements were analyzed from the quantitative (annual publication frequency of book ads), the form and content (types of bibliographic information identified in book ads), as well as the graphic perspective (graphic design of book ads). As we were limited to the first twenty-five years of the newspapers' publishing life (newspapers are even today known as Narodne novine), the aim of this research was to investigate what types of bibliographic information (author, title, place of publication, printer/publisher/bookstore owner, book content, prices, and book format) had been considered the most important when selling a book in the time span analyzed. The second aim was also to examine the extent to which the 19th century newspapers had been recognized as the important marketing medium. In addition, one of the goals of the present study was also to detect in what way the book ads examined had resembled the contemporary way of book advertising. The authors conclude that the book advertisements were partly similar to the contemporary way of book advertising since almost all of them included the title and author information in the ads, but only occasionally information on book content similar to the ones we have nowadays. Other bibliographic information appeared in the ads irregularly. It can be concluded from this that the publishers/printers and bookstore owners were still insufficiently prepared for this kind of book advertising, which confirms previous known findings drawn upon some other newspapers.

Keywords: *book ads, bookselling, marketing, Novine horvatzke, newspapers, 19th century.*

1. Introduction

With the development of information technology and marketing, publishers and bookstore owners today have the opportunity to advertise their products in a variety of ways - from book promotions and interviews with the authors in the course of events to book promotions through television commercials, Internet portals, guerrilla marketing and jumbo posters. Video book trailers on the Internet portals of different publishers have lately become also very popular (Ragen, 2012, 8-13). However, if we take a look at the marketing opportunities in the course of history, we can see that the possibilities have been far more limited. New editions have been advertised in bookstore windows, at book fairs, on posters and leaflets, in book catalogues, calendars and in already published books. From the 18th and 19th centuries book advertisements appeared also in newspapers (Stipčević, 2006, 482-489, 624-627). Due to their fast pace of publishing, newspapers proved to be a much more efficient way of advertising books at the time and could also reach a larger circle of people than all previous forms of advertising (Krtalić, 2008, 75-76). When the first newspapers (Horvat, 2003, 31-50, 75-107)[1] appeared in the Croatian historical area at the end of the 18th and the beginning of the 19th century, Croatian publishers, bookstore owners and printers, often combined in one person, recognized their marketing potential. This was recognized by the book authors themselves, who often sought out subscribers to their works through newspapers because they could not print them without financial support.

Although already recognized in the 19th century as an extremely useful way of disseminating various information (Stipčević, 2006, 483-484), including those on literary novelties, newspapers from this aspect became interesting to scientists only when the discipline of book history and reading was beginning to emerge in scientific circles over the last two decades. Book advertisements in three Osijek newspapers from the second half of the 19th century, were examined by Maja Krtalić (Krtalić, 2008, 75-92). Zoran Velagić and Nikolina Dolfić were doing similar research on the example of two Zadar newspapers from the first half of the 19th century (Velagić and Dolfić, 2009, 47-63) whereas Jelena Lakuš and Iva Magušić-Dumančić, formed their view of book advertising on the example of *Danica*, the literary supplement of the Croatian newspaper *Novine horvatzke*, the first newspaper in Croatian language (Lakuš and Magušić-Dumančić, 2017, 45-72). Marin Knezović (Knezović, 2001, 47-76), Vlasta Rišner and Maja Glušac (Rišner and Glušac, 2011, 417-436) were examining the newspaper advertising in general, including book advertising as well.

The papers analyzed so far mostly belong to the period during and immediately after the Croatian national revival,[2] which is not surprising at all. It is a time that also coincides with the beginnings of the creation of the modern civil society and with the development of an economy that has engulfed the whole of Europe since the 1830s, encouraging alongside the production of consumer goods also the development of advertising (Lakuš and Magušić-Dumančić, 2017, 49). This tendency resulted in the appearance of the first commercial advertisements in the newspaper *Novine horvatzke* (https://www.enciklopedija.hr/natuknica.aspx?id=44829, 18 February 2020), which was launched in January 1835 by the renowned Croatian revivalist

---

[1] The first newspapers in Croatia were published in Latin and German languages, and these were the papers *Ephemerides Zagrabienses* (1771), *Agramer deutsche Zeitung* (1786) and *Kroatischer Korrespondent* (1789). The first newspapers in Croatian language appeared at the beginning of the 19th century, the Italian-Croatian papers *Il Regio Dalmata-Kraglski Dalmatin* (1806-1810) and *Novine horvatzko-slavonsko-dalmatinske,* which began to be published in 1835.

[2] *Hrvatski narodni preporod* [Croatian national revival] is the term depicting „national, cultural and political movement in Croatia from 1835 till 1848. It emerged from the economic, political and social development of Croatia, and is in connection with the process of the formation of European nations in the 19th century (https://www.enciklopedija.hr/natuknica.aspx?ID=26455, 18 February 2020).

Ljudevit Gaj (Stančić, 1998). Although book advertising in the literary weekly supplement *Danica* has already been analyzed, book ads in the newspapers themselves have not been researched so far. The corpus of the present research therefore consists of the newspapers mentioned due to three main reasons. Firstly, this is the newspaper where the first commercial advertisements appear. Secondly, these were the first Croatian language newspapers and their launching marked the beginning of the Croatian national revival. As such, they were certainly attractive as an advertising medium to writers, printers, publishers and bookstore owners, since the newspaper certainly reached a relatively large number of people.[3] And thirdly, their importance has also been reflected in the fact that they still exist today under the name *Narodne novine*.

Given that all previous studies have been fragmentary and, with the exception of one paper, do not deal with formal-content and graphical analysis of advertisements, the aim of this paper is to supplement the previous researches so that a more complete picture of the usage of the 19th newspapers for book advertising purposes can be obtained. Our research intends to determine what bibliographic information on books can be found in the advertisements analyzed: author, title, place of publication/printing, publisher/printer/bookstore owner, price, format, number of pages, and content. It starts with the assumption that the advertisements will contain those bibliographic data that according to printers, publishers, bookstore owners and authors contained crucial information in book promotion. The goal of the paper is to establish the extent to which these early beginnings of book advertising differed from the contemporary ways of book advertisements.

2. Research Methodology

The survey was conducted on the corpus consisting of Gaj's newspaper issues that were published in the first twenty-five years, from 1835 to 1860, because this was the time of the development of advertising. All issues (26 altogether) are accessible through the web page *Stare hrvatske novine* (http://dnc.nsk.hr/Newspapers/Default.aspx, 18 January 2020). During this period a total of 5016 issues were published. At the outset the newspaper was published twice a week, but the frequency of its publication, as well as the name,[4] changed in the course of years. Between 1847 and June 1849, the newspaper was published three times a week, and thereafter every day except Sundays and public holidays.

---

[3] We do not have exact data regarding the number of readers of *Novine horvatzke*. However, we know that at that time the number of subscribers to magazines and newspapers, and thus of their potential readers, ranged between 500 and 1200, with most newspapers still being on the lower boundary (Barac, 1933, 2). We also know that an equally important revival newspaper, *Zora Dalmatinska*, had 748 subscribers (Lakuš, 2009, 37, 39-40), which leads us to the conclusion that a similar number of subscribers could have read this newspaper as well. Taking into account the fact that coffee shops, libraries, bookstores and other collective subscribers were often subscribed to newspapers at that time, the number of those who came in contact with the paper itself was presumably even higher.

[4] From 1836 the newspaper was published under the name *Ilirske narodne novine*. After the name "Ilirski" was banned, the newspaper changed its name to *Narodne novine* in 1843 and was issued under this name until March 1844. The name then changed to *Novine horvatsko-slavonsko-dalmatinske*, which was kept until the end of 1846. In January 1847 it changed its name to *Novine dalmatinsko-hervatsko-slavonske,* which lasted until 1849. During this period, the newspaper editors also changed and instead of Ljudevit Gaj, the newspaper was edited by Bogoslav Šulek, who is otherwise considered as the first professional journalist in Croatia. After June 1849, the newspaper changed its name to *Narodne novine*. In February 1850, it came to be the official newspaper for Croatia and Slavonia, which was reflected in its contents as well, as we can find a large number of notices on new laws, job vacancies and similar advertisements. The last change in the name of Gaj's newspaper occurred in 1853 when the name was changed to the *Carsko-kraljevske službene narodne novine* and published under it until 1860. From 1861, the newspaper changed its name to *Narodne novine*, which is also its contemporary title (Horvat, 2001, 75-107).

Book ads needed to be identified by carefully reviewing each issue of our corpus. There have been several items taken into account, like brief announcements on book editions, announcements on the beginning or completion of printing works, reviews of new literature and calls for subscriptions published by newspapers, publishers, bookstore owners or by the authors themselves. The calls to subscribe to book series have been excluded from the research, just like the reports of the societies *Družtvo Matice ilirske* and *Družtvo za poviestnicu*, within which it was often possible to find information on works financed by one of them. After identifying the book advertisements in the newspaper issues, there was a quantitative and qualitative analysis of the advertisements carried out based on the methodology applied to the analysis of the weekly literary supplement of Gaj's newspaper, *Danica*. The aim of quantitative analysis was to determine the frequency of publication of book advertisements during the period analyzed in order to detect the extent to which printers/publishers/bookstore owners and authors held this form of advertising important. All advertisements in which bookstore owners, publishers, printers, and authors promoted new issues have been taken into consideration. Thereafter, it was necessary to remove duplicates, which appeared often, since some advertisers advertised their items in the course of several months. The exclusion of duplicates enabled a more thorough qualitative and/or formal-content analysis. The formal-content analysis consisted of an analysis of the representation of bibliographic data appearing in the advertisements (author's first and last name, title of the work, place of publication/print, information about the printer/publisher/bookstore owner, price, format, number of pages and content) in order to conclude which bibliographic information were considered crucial by printers, publishers, bookstore owners and authors when advertising books. Advertisements that contained information on the author, the title of the book, place of printing/publication, information on the printer/publisher/bookstore owner, and information on format were sorted into three main categories: advertisements that have this information, advertisements that did not have this information, and the "other" category with advertisements in which works were published with miscellaneously cited and available bibliographic information. Regarding the information on the content the advertisements have been listed into two categories only: the ads that did not have this kind of information and those that had it. The analysis of price data was somewhat more complicated due to the fact that prices appeared in different currencies. In order to make the analysis and comparison of price data easier, all the price data was converted to a single currency - the kreutzer. Certain prices were expressed in both forints and kreutzer, the currency that was used in the Austrian Empire at the time of the publication of Gaj's papers. During the conversion there was the change in the equivalent also taken into account, since in 1857 there was an increase in the value of the kreutzer to the forint. All forint prices appearing in book advertisements published until 1857 were converted to kreutzer in the ratio 1: 60, and after 1857 in the ratio 1: 100 (Jakobović, 2014, 50). The calculated values have been divided into several categories to make the analysis simpler: 0-49 kreutzer, 50-99 kreutzer, 100-149 kreutzer, 150-199 kreutzer, 200-399 kreutzer, 400-499 kreutzer and 500 or more kreutzer. However, we found several advertisements that did not contain price data at all, and therefore we had to form the category "other" as well with currencies that could not be converted into kreutzer (francs, lire, etc). Further categorization of book advertisements included sorting them into categories according to page information. The categories were therefore: 0-49 pages, 50-99 pages, 100-199 pages, 200-299 pages, 300-399 pages, 400-499 pages, 500 and more pages. Here too we had to open the "other" category containing advertisements without page information, or those featuring works with differently listed page information. There was also the format of advertisements analyzed, more precisely the format which appeared in advertisements as folio (2° or 2 sheets), quarto (4° or 4 sheets), octavo (8° or 8 sheets), duodecimo (12° or 12 sheets) and sextodecimo (16° or 16 sheets) (https://www.enciklopedija.hr/natuknica.aspx?id=32108, 21 February 2020). Here too we had

to open the "unknown" category for ads that did not have the information on the format. Finally, the advertisements have been analyzed according to their graphic value, so that even through this aspect, we could get a clearer idea of whether printers/publishers/bookstore owners and the authors recognized the newspaper as an important medium of book advertising.

3. Quantitative analysis of book advertisements

By analyzing the aforementioned 5016 issues of *Novine horvatzke*, we found 1801 book advertisements in 745 issues. In *Danica*, which was a literary and cultural weekly supplement to *Novine horvatzke*, and was published intermittently from 1835 to 1867,[5] there were 1028 book advertisements found (Lakuš and Magušić-Dumančić, 2017, 51). Other newspapers, to our knowledge, contained a significantly smaller number which could only be counted in dozens of advertisements.[6]

Chart 1: Frequency of book advertisements in Novine horvatzke
An analysis of the frequency of the appearance of advertisements showed that the ads did not appear in every issue. At the same time, there were also cases in which several ads were found within the same issues. Although during the first three years there have almost not been book advertisements in the paper, it is evident that their number has increased over the years (Chart 1). In the period from 1838 to 1852 the number of advertisements increased, with the exception of the period from 1846 to 1849. In those years, just like in the case of *Danica*, there was a sharp decline in the number of advertisements, which can be interpreted through war and revolutionary events that hit the Empire that may have caused a decline in interest in new books

---

[5] *Danica* was published from 1835 until 1849, in 1853 and from 1863 until 1867.
[6] We have data on the number of book ads available for the Zadar newspapers *Kraljski Dalmatin* (1806-1810) and *Zora Dalmatinska* (1844-1849), in which only 7 and 93 book advertisements respectively, were identified. *Kraljski Dalmatin* was the newspaper of the French administration in Dalmatia, which aimed to propagate the ideas of the regime and, in addition to official notices, brought various practical instructions for the local population, especially of the economic nature. However, it was not oriented towards the culture (Horvat, 2001, 46-50), which was the reason why it contained very few book advertisements. *Zora Dalmatinska* (1844-1849) was initially conceived as an enlightenment-scholarly journal, but later it was profiled as a literary journal, so that the number of identified book ads was slightly higher, there were 93 found (Velagić and Dolfić, 2009, 50). There are also information available for the Osijek papers *Esseker allgemeine illustrierte Zeitung* (1869) and *Die Drau* (but only in the first ten years of its publication, from 1868 to 1877). *Esseker allgemeine illustrierte Zeitung* (1869) was the first illustrated newspaper in Croatia and, although in German, it brought news from the cultural life of Osijek where it was published, alongside the literary and other articles (Malbaša, 1978, 31). Despite its profile, there were only 16 book ads found in it. The same number of book advertisements was found in the second Osijek-based newspaper analyzed, *Die Drau* (1868-1932), which brought news from the economy, the everyday life of the city, but also from the culture. In the first decade of their existence, only 16 book advertisements were found there (Krtalić, 2008, 89-90). Only 6 advertisements were also found in *Branislav* (1878), the first newspaper published in Osijek in Croatian language, which also had the subtitle "Newspaper for the Politics and Advanced Economy" (Krtalić, 2008, 88-90).

(Lakuš and Magušić-Dumančić, 2017, 52). Whether this had been influenced by the fact that in those years Bogoslav Šulek was the editor of the newspaper, it is difficult to say. In the period up to 1852, an average of 60 advertisements have been published annually. A similar conclusion was reached by Marin Knezović, who did a research on the first five years of publishing of the newspaper analyzed, only to find that there were 53 advertisements published annually until 1839 (Knezović, 2001, 62-63).[7] Sometimes, as in the aforementioned period from 1846 to 1849, this number was smaller than average and ran about 30 or 40 advertisements a year, sometimes reaching about 80 (1844 and 1845), or 90 (1851), up to the number of 140 advertisements, as was the case in 1852. In the period from 1853 to 1856, there was a rapid decrease in the number of advertisements recorded, which was reduced to only one third and even a quarter of the number of advertisements published in 1852. There are several interrelated reasons for this. Already in February of 1850, Ljudevit Gaj announced that the newspapers had become the official newspapers for Croatia and Slavonia, which was reflected not only at the formal level, in form of the change of name, *Carsko-kraljevske službene narodne novine* (since 1853), but also at the content level. The national newspaper, which, with the *Agramer Zeitung*, were the only permissible newspapers in the time of Bach's absolutism (1852-1859) (Horvat, 2001, 153-156) became, first of all, a platform for publication of a large number of official public auction announcements, various job vacancies, announcements related to political situation in the country and the like, while book advertisements in large numbers began to be published in the literary supplement, *Danica*. This is corroborated by the fact that exactly in that year there was the highest number of book advertisements published in *Danica*, 175 altogether (Lakuš and Magušić-Dumančić, 2017, 52). Since *Danica's* release was suspended the year after, a large number of advertisements were gradually re-appearing in the same main newspaper. There were 274 advertisements published in 1859. A greater number of advertisements was also indicated by the fact that Gaj's newspaper was published every day, except on Sundays. However, it is also most likely that in the late 1850s and early 1860s there was an increased production of books through opening of new printing and publishing houses, as well as an increase in the number of bookstores across Croatia (Vodopija and Hekman Mandić, 2009, 21 -34).

4. Qualitative analysis of advertisements: The representation of bibliographic descriptions in book advertisements

4.1. Author and book title

Information on the book title was found in 1,127 advertisements, or 91% of them. Only 95 ads (about 8%) do not contain this information.[8] Such was, for example, Ljudevit Vukotinović's call for interested readers to subscribe to his collection of poems, but although he stated the price of the collection, as well as the persons who should collect the subscription, he did not specify its specific title.[9] However, the vast majority of advertised works had its title mentioned. In addition to that, the title usually bore information that in the graphic sense dominated the advertisement and seemed to be more important than the authors themselves (Figure 1).

---

[7] According to Knezović, in the first five years of publishing (1835-1839) there were 265 book advertisements found (Knezović, 2001, 62-63). The referred article, however, does not mention what was included into the category of book advertisements.

[8] Advertisements in the category "other" make up only 1% of the total number of ads (13 advertisements).

[9] Novine horvatsko-slavonsko-dalmatinske, year 12, number 93 (17 November 1846.)

We find information on authors in 877 ads, i.e. in 71% of them, but 336 advertisements, or even 27%, do not contain this information.[10] These are usually calendars,[11] dictionaries[12] and religious works,[13] which, given their often compilatory nature, is understandable. However, there are also literary works without authors mentioned, for instance collections of poems by different authors.[14]

Figure 1: Ilirske narodne novine, year 8, number 72 (September 6, 1842)

It seems that, as in *Danica* (Lakuš and Magušić-Dumančić, 2017, 56), the way in which information about the author was presented has been largely reduced to the author's first and last name, sometimes this information has not even been completely given. For example, it has been advertised that the Russian translation of Dumas's work entitled *Catharina Howard*[15] has been published in Moscow. The impression is that the advertisement implies that readers know very well which writer it was, and therefore it was considered unnecessary to add some more information about the writer. In Adolf Tkalčević's advertisement for the book *Put na Plitvice* we can also read: "Whoever knows its writer, he is already convinced that this book must be distinguished by its special beauty of language, elegant style and interesting description."[16] Therefore, it has been calculated that readers were very familiar with the writer and the style of his writing. We can therefore conclude that it was unlikely that publishers, printers and bookstore owners held this information unimportant, but the readers were well-versed in domestic and foreign literature, so they did not even need more clarification.

4.2. Information on the place of publishing/printing, bookstore, publisher and printer

We find information on the place of publishing/printing in only about 46% of advertisements (564 ads). This specific data for the remaining 655 advertisements (about 53%) is actually missing.[17] While it may seem that this sort of information has not been held relevant by the printers/publishers/bookstore owners, it is more likely to presume that readers had good knowledge of the bookstore market and knew very well where exactly certain publishers/printers were situated. An example of this is the advertisement on Benjamin Franklin's book *Put do bogatstva*. The ad states that the booklet came out right now "at the expense of Jak. Pretner, build. bookbinder ".[18] Although the advertisement does not explicitly

---

[10] Advertisements in the category "other" make up only 2% of the total number of advertisements (22 ads).
[11] Ilirske narodne novine, year 7, number 91 (13 November 1841), Narodne novine, year 9, number 6 (21 January 1843)
[12] Ilirske narodne novine, year 7, number 31 (17 April 1841)
[13] Narodne novine, year 9, number 29 (12 April 1843)
[14] Ilirske narodne novine, year 7, number 29 (10 April 1841), Narodne novine, year 9, number 10 (4 February 1843)
[15] Ilirske narodne novine, year 3, number 63 (8 August 1837)
[16] Carsko-kraljevske službene narodne novine, year 26, number 48 (February 28 1860.)
[17] In the category "other" there were only 16 advertisements or 1.29%.
[18] Narodne novine, year 9, number 29 (12 April 1843)

state the place of publication of the work, the assumption is that readers knew very well that the work was published in Karlovac, where Ivan Nepomuk Prettner had a printing house and a book binding workshop since 1821, and since the 1830s a bookstore as well, placing himself high on a ladder of the printing and book world (https://www.enciklopedija.hr/Natuknica.aspx?ID=50254, 16 February 2020). In addition, it seems that it was much more important to point out where the book could have been obtained than where it was printed/published. In the case of Gundulić's *Osman* it has been stated that the book had been printed and could be obtained from the reading room at the Secretary Vjekoslav Babukić, but the advertisement does not state the exact location of its printing.[19]

The largest number of advertised books was printed in Zagreb, but the places of publication of other books (Vienna, Prague, Warsaw, Novi Sad, Belgrade, Zadar, Osijek, Paris, Petrograd, Ljubljana, Pest and numerous other cities across not only Croatian countries but also Europe) indicate that the readers of the newspaper were well informed about the book novelties in both the domestic and European markets. This is evidenced by the large number (150 in total) of printers/publishers/bookstore owners that appear on the pages of the newspaper issues examined. When the owners of advertisements are analyzed, we can see that the most belong to Ljudevit Gaj, the founder and editor of the newspaper, and Franjo Župan, a member of the well-known Croatian family of bookstore owners, printers and publishers (https://www.enciklopedija.hr/natuknica.aspx?id=67847, 18 February 2020). Milan Hiršfeld and Dragutin Albrecht, publishers and bookstore owners appear in a slightly smaller number, as well as the Czech Jan Postavit Pospíšil, Danilo Medaković from Belgrade and Battara brothers from Zadar. Summing it up, there is about 44% of advertisements in the newspaper citing printers/publishers/bookstore owners, but there is also a relatively large percentage of ads that do not contain this information (about 55%).[20] This is partly due to the fact that our survey also included subscription calls that were printed before starting to print the actual work, through which the writers sought to raise means to publish the book.[21]

4.3. Information on the price of advertised books

We find price data in about 43% of advertisements, more precisely in 532 of them, which is a slightly higher percentage than the one identified in the analysis of *Danica* (28%). Citing this information often depended on who was marketing the book. The most consistent in this regard were Ljudevit Gaj, Franjo Župan and Milan Hirschfeld.

Table 1: Information on the price of advertised works

Price in kreutzer	Number of ads	Percentage
No information on the price	703	56,92%
0-49	205	16,59%
50-99	63	5,10%
100-149	23	1,86%
150-199	6	0,48%
200-399	17	1,37%
400-999	1	0.08%
1000 and more	2	0,16%
Other	215	17,40%
TOTAL	1235	99,96%

---

[19] Novine horvatsko-slavonsko-dalmatinske, year 10, number 36 (4 May 1844)
[20] Advertisements in the category "other" make up only 1,38% advertisements, or 17.
[21] Ilirske narodne novine, year 9, number 3 (11 January 1843)

Almost 57% of ads (703 of them) have no price data. Most often, such advertisements did not include information about the printer/publisher/bookstore owner. It seems that pricing was still not a common practice or that the information, as discussed by Lakuš and Magušić-Dumančić, was deliberately omitted in order not to turn away potential buyers (Lakuš and Magušić-Dumančić, 2017, 58). This is also corroborated by the fact that among the advertisements that highlighted the price were the very often cheaper works, those that cost up to 49 kreutzer (almost 17% or 205 advertisements) and those that cost from 50 to 99 kreutzer (about 5% or 63 ads) (Table 1). These works differed according to genre, so we can find religious works,[22] calendars,[23] various practical manuals,[24] literary[25] and historical works[26] among them. However, it seems that even cheaper works were not accessible to the lower classes of society. We found, for example, in an advertisement for a booklet entitled *Bogoljubnost svetkovinah B. D. Marie*, which was being sold for only 10 kreutzer, that the Bishop of Đakovo Josip Kuković handed out 500 pieces to the poor inhabitants of Požega.[27]

Among the books analyzed two had the highest price. One of them was the work of a naturalistic nature (on botany) by Professor Dr. Constantine pl. Ettinghausen and Dr. Alois Pokorny, printed in Vienna. The work cost as much as 160 forints, or 9600 kreutzer, came out in five volumes in the large folio format, on the finest paper, and was equipped with a large number of tables, which, of course, raised its price.[28] The second was of a historical nature, entitled *Monumenta Hungarico Historica*. It was published by the History Department of the Hungarian Academy of Sciences. The price of each volume of this monumental piece (until that time three volumes were published), was 10 forints, or 1000 kreutzer. There is no information about the format, binding or illustrations.[29] It is noticeable that the more expensive books were mostly published beyond the boundaries of the Croatian historical territories. Nevertheless, there were several exceptions, like the advertisement for the fifth volume of the *Arkiva za poviestnicu jugoslavensku*, edited by Ivan Kukuljević Sakcinski, which was being sold at the price of 2 forints and 30 kreutzer, more precisely 230 kreutzer.[30]

The price of the work seemed to be shaped by the art of binding and the quality of the paper. For instance, Dragutin Seljan's book *Početak, naprědak i vrědnost Literature ilirske, s kratkim geografičko-statističkim Ilirskih državah*, cost 30 kreutzer, if it was in soft cover, or 40 kreutzer if it was printed on a finer paper.[31] Likewise, the prayer book *Jezgra kèrstjanske Bogoljubnosti za svakdanju potrebu* by Antun Sabolović could be obtained for 30 kreutzer if purchased unbound, printed on a "good machine paper". However, if the buyer wanted to get a hard copy or an unbound copy printed on a particularly fine paper, he had to give out 1 forint, or 60 kreutzer. If he wanted to get a leather-bound piece with a golden border, the amount would then be increased to 2 forints and 40 kreutzer, or altogether 160 kreutzer.[32]

[27] Narodne novine, year 9, number 29 (12 April 1843)
[28] Carsko-kraljevske službene narodne novine, year 22, number 158 (10 July 1856)
[29] Carsko-kraljevske službene narodne novine, year 24, number 41 (20 February 1858)
[30] Carsko-kraljevske službene narodne novine, year 25, number 83 (12 April 1859)
[31] Ilirske narodne novine, year 6, number 60 (28 July 1840)
[32] Ilirske narodne novine, year 7, number 8 (26 January 1841.)

4.4. Information on the format

We find data on format in only about 7%, or 85 advertisements, while there are about 1130 ads (91%) that do not contain this kind of data.[33] As in *Danica*, most of the books were printed in the octavo (small) format, although this percentage when all book ads is calculated is very small and amounts to only about 5% (66 works) (Table 2). According to the examination of records in *Danica*, the number is slightly higher, about 11%. The books in the octavo format were of different contents, from literary and historical works to dictionaries and grammars, although there are also some examples of collections of church songs.[34] The large folio format was found only once, in the already mentioned example of the Viennese work on botany by Professor Dr. Constantine pl. Ettinghausen and Dr. Alois Pokorny, which was also the most expensive advertised piece.[35] Only a handful of works were printed in other formats, most of them in a very small sextodecimo format. The works of this format had different contents, but very often can we find calendars,[36] works of a religious nature (handy religious booklets intended for the lower classes),[37] practical manuals,[38] and even occasional books.[39]

Table 2: Information on the format of the works advertised

Format type	Number of ads	Percentage
No information on the format	1130	91,49%
2º	1	0,08%
4º	3	0,24%
8º	66	5,34%
12º	4	0,32%
16º	11	0,48%
Other	20	1,61%
TOTAL	1235	99,56%

4.5. Information on the number of pages

Information on the number of pages is very rarely put in advertisements, so that we found it in only 88 ads, or about 7% of them.[40] If we analyze only *Danica*, we can see that this number is bigger, referring to 20% of the ads (Lakuš and Magušić-Dumančić, 2017, 61). The remaining advertisements, 1127 or 91%, do not contain this information (Table 3). If we sum up the analysis, we can see that the most advertised were works with up to 200 pages, followed by works that had less than 50 pages and works with less than 100 pages. Few works had more than 200 pages. The largest work was the book by the Jesuit Karl Passaglia entitled *De Immaculato Deiparne semper Virginis Conceptu commentarius*. The book was published in a "magnificent edition," in two parts, in the octavo format of 1088 pages.[41] Unfortunately, there is no indication at what price the book could be bought. We also find dictionaries, such as the *Němačko-ilirski slovar* by Ivan Mažuranić and Jakov Užarević, printed on "fine machine paper" in the octavo format with 486 pages, which shaped its relatively high price of 5 forints,

---

[33] Advertisements in the category "other" contain only 20 ads, or 1.61%.

[34] Carsko-kraljevske službene narodne novine, year 24, number 298 (30 December 1858.)

[35] Carsko-kraljevske službene narodne novine, year 22, number 158 (10 July 1856.)

[36] Novine horvatsko-slavonsko-dalmatinske, year 12, number 79 (3 October 1846.)

[37] Narodne novine, year 9, number 29 (12 April 1843.)

[38] Novine horvatsko-slavonsko-dalmatinske, year 14, number 88 (17 August 1848.)

[39] Carsko-kraljevske službene narodne novine, year 23, number 205 (10 September 1857.)

[40] Advertisements in the category "other" contain only 20 ads, or 1.61%.

[41] Carsko-kraljevske službene narodne novine, year 20, number 274 (29 November 1854)

or 300 kreutzer.[42] Among the books with lots of pages we also find travelogues,[43] historical[44] and literary works, such as the 552-page collection of poems originating from one hundred and twenty poets from the territory of the Austrian Empire.[45] Although the advertisement for the book mentions its highly detailed content and its relevance to the Austrian Empire, it does not provide the information on its price.

Table 3: Information on the number of pages of the books advertised

Number of pages	Number of ads	Percentage
No information on the number of pages	1127	91,25%
0-49	16	1,29%
50-99	15	1,21%
100-199	32	2,59%
200-299	9	0,72%
300-399	8	0,64%
400-499	6	0,48%
500 and more	2	0.16%
Other	20	1,61%
TOTAL	1235	99,79%

4.6. Information on the content

Information on the content of the work is surprisingly small. Only 196 ads, or just under 16%, contain this data, while 1039 ads or 84% do not cite this information. Advertisements that contain content information have a dual look. Along with very brief information about what is in a particular work, usually in one or two sentences, there is a slightly longer text accompanying these lines which should convince potential readers of its scientific, literary or simply patriotic significance (Figure 2). Advertisements sometimes include recommending that particular book as a gift.[46] Another type of advertisements consists of ads that have a short content of chapters, such as the advertisement of *Kalendar za puk za prostu godinu 1847*, published by Dragutin Rakovac. In addition to the title of the calendar, editors, publishers, place of publication and printing, information about the format and price, number of logs, the advertisement also contains an "index" which describes in great detail what readers can find in the calendar itself (Figure 3). If a work had been published in multiple volumes, we can often find a brief summary of the contents of each volume.[47] We could not have concluded that listing the content would be specific to a particular publisher or bookstore owner. However, it can be noted that the above information existed mostly when literary works or calendars were concerned.

5. Graphic design of book advertisements

In the early years, advertisements were hard to spot in the newspapers because they were not separated from the rest of the text. They were not placed in separate rubrics and were usually shaped like newspaper articles (Figure 4). Since the use of illustrations has not yet been implemented at the time, the advertisements were not illustrated.[48] Sometimes they were just a small entry within a text, which made it difficult to identify them (Figure 5). Advertisements were often mixed with advertisements for other products and services. For instance, the book advertisement for Marjanović's work *Vitiah* was in the *Oglasitelj* section next to an advertisement for the sale of asparagus and other seeds or for the sale of wine.[49] We assume that the readers of the time were thus finding them, because it was generally known where new products and services were supposed to be advertised (Lakuš and Magušić-Dumančić, 2017, 54).

Figure 4: Ilirske narodne novine, year 2, number 2 (January 5, 1836)

Figure 5. Narodne novine, year 15, number 226 (December 28, 1849)

There were very often several works advertised within a single advertisement, which contributed to the opacity. Such an unprecedented way of advertising seemed to be commonplace, since *Danica* (Lakuš, Magušić-Dumančić, 2017, 53) and ads from Osijek newspapers from the second half of the 19th century (Krtalić, 2008, 82) were designed in the same way.

---

[48] The first illustrated paper in Croatia was *Esseker allgemeine illustrierte Zeitung* which was published in Osijek from 1869 (Vinaj, 2003, 7-35).
[49] Ilirske narodne novine, year 6, number 39 (May 16, 1840)

Figure 6: Ilirske narodne novine, year 8, number 68 (August 23, 1842)

Only with the commonly occurring advertisements of the 1840s did ads become separated from the rest of the text, making them easier to see. They were also easier to spot because it became commonplace to physically separate ads of different types with a line (Figure 6).

Table 4: Occurrence of ads according to different sections

Section	Number of ads	Percentage
Not specified	282	22,83%
Slavenske viesti	229	18,54%
Književne viesti	174	14,08%
Austrianska Carevina	121	9,79%
Oglasnik	83	6,72%
Slavjanske vesti	82	6,63%
Knjižstvo	69	5,58%
Oglasitelj	36	2,91%
Hervatska, Slavonia, Dalmacia i Vojvodina Serbia	36	2,91%
Nepolitičke viesti	20	1,61%
Književni oglas	13	1,05%
Različite viesti	11	0,89%
Other	79	6,39%
TOTAL	1235	99,93%

Advertisements appear in nearly fifty different sections. However, most sections have been actually variations of the same section due to the language changes in the time of the National revival. So is for instance the *Oglasnik* section the same as the *Oglasitelj* or *Slavenske viesti* the same as *Slavjanske vesti.* Most of the advertisements, 282 of them actually or about 23%, have been put into the section *Slavenske viesti*, whereas 174 ads (about 18%) have been found in the section *Književne viesti* (Table 4). Ads can also be found in columns organized by regions (*Hervatska, Slavonia, Dalmacia i Vojvodina Serbia, Francezka, Serbia, Cernagora, Gerčka, Rusia, Niemačka, Španjolska, Talianska, Turska, Velika Britania i Irska*), along with other news from these regions, which made it difficult to identify them. The most numerous ones were ads in the *Austrianska carevina* section.[50]

5. Discussion

There are numerous advertisements for books found in Gaj's newspaper. An analysis of the frequency of their publication showed that during the period analyzed they came out regularly, with minor or major oscillations, so we can confirm the previous findings that this type of book advertising was "undoubtedly recognized not only by the publishers and bookstore owners, but also by the authors themselves" (Lakuš and Magušić-Dumančić, 2017, 63). This has been

---

[50] The sections where fewer than 20 ads appear are grouped in the "other" category. There were 79 such ads found, that make up just under 7% of all bookstore ads.

especially evident since the mid-1850s, when the number of ads significantly increased. This is due to the fact that Gaj's newspapers have been published on a daily basis, but also due to the fact that an increasing number of printers, publishers and bookstore owners had an impact on the amount of books in the book market, an increased number of books needed to be promoted. The purpose of the present paper was to identify which bibliographic information about books could be found in advertisements, assuming that the ads contained bibliographic information which was considered crucial by printers, publishers, bookstore owners and authors themselves. The study showed that, similarly to the results of the research conducted on the supplement *Danica*, the most common bibliographic data were the data regarding the title (91%) and author (71%) (Table 5). This information was obviously, as it is today, the most important when identifying a work. Although the information about the author has often been limited to the name only, especially when it came to works in the field of literature, numerous advertisements indicate that the readers of the newspapers were well-versed in domestic and foreign literature and therefore did not need extensive information about the writers. Therefore, we cannot agree with the claim made by Lakuš and Magušić-Dumančić on the basis of the *Danica* advertisement research that "publishers and bookstore owners did not consider information on the author at the time as important or as crucial information that would sell the book" (Lakuš and Magušić-Dumančić 2017, 64). We can find almost identical information on the place of printing/publishing (46%) and the printer/publisher/bookstore owner (44%). That percentage, although in part consistent with the research done on book ads in *Danica*, is actually surprisingly small. It has been presumed that it was in the interest of every bookstore owner or publisher to sell a book, so this information should in fact have been indispensable. However, as with the lack of more detailed biographical information on authors, it seems that printers, publishers and bookstore owners counted on the reader to be well aware of the book market and very well know where exactly certain publishers/printers were situated. In addition, it seemed to be much more important to point out where the book could be purchased than where it had been printed/published. As printers and publishers were very often at the same time bookstore owners, in most cases information about where the book could be purchased was also the same as where it had been printed and/or published. Finally, it should be noted that the survey also included a large number of subscription calls, which, of course, did not even contain information on the place of printing or publishing.

Table 5: Representation of bibliographic data in advertisements

Data	Novine horvatzke	Danica
Title	91%	98%
Author	71%	80%
Place of publishing/printing	46%	62%
Printer/Publisher/Bookstore owner	44%	32%
Price	43%	28%
Contents	16%	54%
Format	8%	15%
Number of pages	7%	20%

The amount of advertisements containing information on the price data (43%) is similar to the number of advertisements containing data to the place of printing/publishing and the printer/publisher/bookstore owner, and is also surprisingly small because in addition to the credibility of the author and the personal preferences of the potential buyers, the price could have also been crucial when buying a book. Regarding this, we could agree with the fact that this "may have indicated that the publishers and bookstore owners had not yet been sufficiently prepared for this type of book advertising" (Lakuš and Magušić-Dumančić, 2017, 63). It can

also be explained by the fact that the price has been deliberately left out, especially in the case of more expensive works.

Almost as a rule, the information on the format (8%) and pages (7%) has also been omitted and could be found in very few ads. Only a slightly higher percentage (16%) represented the content of the advertised works. This information is quite different from the ads published in *Danica*, where the short content of the book or at least some aspects of its genre characteristics appeared in 54% of the cases, probably because *Danica* was a literary weekly supplement. The authors concluded that publishers and bookstore owners were already on the lookout for the modern way of advertising (Lakuš and Magušić-Dumančić, 2017, 63), since, according to some studies, the brief display of the content of the work has still been considered important for potential buyers (Danford, 2004, 45).[51] In Gaj's newspaper this information occurred rarely, although some advertisements containing this kind of information look like the present-day reviews and/or brief displays of the content of advertised works.

6. Conclusion

Throughout the 19th century, newspapers became an important medium for the rapid dissemination of information due to their fast pace of publication and readability. In Croatia the time span examined was the time of the national revival, which was marked by the beginning of the publication of Gaj's newspaper in 1835. This newspaper, along with its supplements *Oglasitelj* and *Danica*, followed the social, political and cultural events in the Austrian Empire. There were numerous sections that printed news about book novelties, announcements of works that would be printed and calls for subscriptions published by printers, publishers and bookstore owners, as well as authors. The purpose of the present paper was to establish the extent to which they recognized the marketing potential of the new medium and how these early beginnings of book advertising differed from today's, contemporary ways.

The study, which complemented some existing research on advertising in 19th century newspapers, found that newspapers were quickly recognized as a new marketing medium and that interest in advertising in them had grown over the years. This form of advertising was in many ways similar to the ways of advertising today, because it was almost as a rule that information about the author and title of the book should be given. However, unlike today, when it is quite common to find all other relevant bibliographic information about a book in advertisements like information about the publisher (although not always the publisher's headquarters), year of publication, number of pages, binding, language, price, ISBN (International Standard Book Number)[52] and review or summary of the work[53] many of this information, and in particular the number of pages and the contents of the work were regularly missing from the 19th century advertisements. We did not find book covers either (because the graphic design of the advertisements was very modest) or quotes, which are nowadays commonly used in bookstore advertisements (Krtalić, 2008, 77). Even when information on the content even emerged it was very fussy. Very rarely, there were some examples of advertisements in which the accompanying text sought to convince readers of the scientific or literary value of a work or to indicate its patriotic significance, which is quite similar to the review or book presentation nowadays that very often stand alongside a book that is being

---

[51] A survey of user perceptions of book ads by Bookreporter.com in 2004 found that 83.1% of readers consider information on book content to be the most important.

[52] The ISBN started as SBN (Standard Book Number) in 1966 in the UK, but was only used by English-language publishers. In the 1970s, it was internationally accepted and renamed the ISBN (International Standard Book Number). It is a unique identifier for books and other limited publications (What is an ISBN?).

[53] If it is a translation, information about the translator is also provided, and if it is an award-winning work or an award-winning writer, that information is also mandatory

advertised. This led us to the conclusion that, as Lakuš and Magušić-Dumančić stated, publishers and bookstore owners were already on the lookout for the modern way of advertising their products (Lakuš and Magušić-Dumančić, 2017, 63). The future projects that would include the analysis of the section of *Oglasitelj* of Gaj's newspaper, as well as some other newspapers published in the 19th century, would most certainly provide an even more detailed and comprehensive picture of the role that newspapers had in the world of book marketing at that time.

IMPACT OF PUBLIC DEBT ON THE ECONOMIC GROWTH OF THE REPUBLIC OF CROATIA

ABSTRACT

Transition countries need a level of supplementary external debt financing in order to further accelerate economic growth. In the Republic of Croatia, the state was the main generator of foreign debt growth, especially during the crisis period 2009-2015. The public debt to gross domestic product ratio was 84% at the end of 2016. When external debt rises above a certain level, competitiveness decreases, interest rates rise, there is instability in the national economy. The government must therefore adopt a well-balanced public finance plan in order to maintain a stable economic growth with high levels of employment and low inflation. It is imperative to improve public debt management, increase the transparency of the work of the bodies responsible for managing them, and initiate structural reforms to make them more attractive to new investments. With Croatia's accession to the European Union, merchandise exports have increased, but we are still lagging behind comparable transition countries.

Key words: *public debt, government indebtedness, economic growth, competitiveness, public debt management.*

1. Introduction

By decision of the Council of the European Union, the Republic of Croatia (hereinafter: Croatia) withdrew from the excessive deficit procedure in June 2017. Exit from the six-year economic downturn in 2015 and fiscal consolidation in 2016 proved to be of key importance, when the budget deficit was reduced to 1% of the gross domestic product (hereinafter: GDP) and public debt to 80.5% of GDP. (Ministry of Finance, 2020). It is expressed in monetary units and includes only those products and services that are completed and ready for immediate consumption. GDP is in fact the most comprehensive benchmark of overall economic activity. It is the value of completed goods and services that have been produced within one country over a certain period of time, most often on a quarterly, but annual basis (Economic Dictionary, 2020). During 2017 and 2018, positive developments in the economic activity continued and budget surpluses were recorded in both years. These positive fiscal developments have led to a decrease in the public debt-to-GDP ratio of more than 9 percentage points, from 83.7% of GDP at the end of 2015 to 74.6% of GDP in 2018. In the last few years, borrowing conditions on the domestic and international financial markets have improved, and an active public debt management policy has reduced interest expenditure. According to a report from the European Commission, Croatia has progressed from a category of countries with excessive

macroeconomic imbalances to a category of macroeconomic imbalances. These are all positive indicators, but the country's economy is still characterized by challenges related to low potential growth, high nominal levels of public debt and present macroeconomic imbalances (Government of the Republic of Croatia, 2019).

The aim of this paper is to evaluate the specific parameters of fiscal policy in Croatia, as one of the youngest members of the European Union, and to define the recommendations of European Union in order to improve public debt management.

2. Public debt

Public debt is an alternative way of financing public expenditure, and is based on the voluntary and market relationship of the creditor and the state as a debtor, which undertakes to repay the debt with associated interest. The state borrows for the purpose of raising funds for financing capital projects, repayment of existing debts, implementation of stabilization policy measures and smoothing of the tax burden (Bajo, Primorac, Andabaka Badurina, 2011, 13). These are all the amounts that the government borrowed in order to finance past deficits. Deficit is the excess of budget expenditures over revenues over a certain period of time. Its impact on the economy and their interaction with other economic sizes is seen in the context of concrete fiscal policy. Deficit financing through public debt means the sale of securities with an obligation to repay interest over a number of years, and eventually usually also the principal. When buying and selling securities, there is no coercion, and it is voluntary, the state competes with the other borrowers in the capital market and pays the required interest (Institute of Public Finance, 2017). Most often, there are two components of public debt: internal and external, with external debt being considered less favorable due to possible pressures by international financial circles in the event of irregular performance. There are also two basic ways of borrowing, by taking loans from banks and other financial institutions and issuing government securities on the domestic and foreign financial markets (Švaljek, 1997, 37). There is no single view on fiscal deficit and public debt. This is a result of the assumptions on which the models of the different schools are based. Regarding the economic effects of fiscal deficits, there are Keynesian, Ricardian and neoclassical economic schools. Given the empirical validation and their strength, the Ricardian paradigm must be rejected for theoretical reasons and because there is little evidence of actual economic sizes' behaviour. Much of the macroeconomic empirical research shows that the deficit does indeed have real effects. The main disadvantage of other schools is that, when studying the effects of deficit and public debt on economic activity, they largely ignore the essential elements of policy of deficit financing: the way in which the deficit is financed (debt or monetary financing), the cause of the deficit (increase in government spending or reduction of tax revenues), tax revenue structure and government spending structure, the deadline for deficit financing (except for the neoclassical school that distinguishes between permanent and temporary deficits) and whether exogenous policies are anticipated or unanticipated (Institute of Public Finance - Research, 2001). The economic consequences of public debt can be short-term and long-term. Often the term "crowding out" is used in the literature. Increased government spending on goods and services is pushing out investments. The extent to which the crowding out will occur depends on the financial markets and monetary policy. Deficit financing does not necessarily reduce investments, they will be reduced only because of a mismatch between fiscal expansion and a restrictive monetary policy that does not allow money supply to increase together with rising demand. Public debt has a long-term effect on the accumulation and spending of future generations because the burden of servicing debt reduces the ability of the population. Large public debt reduces economic growth because instead of accumulating private capital, government debt is accumulated. At the time of the sale of government bonds, the savings of the population are transferred, and instead investing

in houses, stocks or bonds of companies, people invest into government bonds. In this way, public debt influences the decrease of production, wages and income.

2.1. Classification of public debt

Public debt is classified according to six criteria. According to institutional coverage there are government and public debt. Government debt includes central government consolidated budget debt. This refers to the state budget and extra-budgetary users. General government public debt includes the consolidated central government budget debt and local and regional government budget debt.

According to the origin (creditor domicile) it is divided into external and internal debt. Most commonly used criterion is debt origination market. Government debt held by domestic creditors is an internal public debt whose repayment represents a redistribution of purchasing power from the taxpayers to those who have in the past been creditors of government debt. When a country borrows abroad, we are talking about external public debt. As it is repaid, the funds are leaving the country, the trade deficit is growing, and servicing them can have serious consequences on the actual loss of production capacity of the debtor country.

According to maturity structure there are short-term, medium-term and long-term debts. The short-term is usually the one with a maturity of up to one year, medium-term with a term of one to ten years, and long-term debt is considered to be one with a maturity longer than ten years.

According to the currency structure, public debt can be expressed in local and foreign currency. Debt issuance in the local currency supports the construction of a benchmark domestic yield curve, which is why borrowing in local currency is preferable to borrowing in foreign currency. The risk which is increased with changes in foreign currency exchange rates further demotivates the issuance of foreign currency debt. However, it is also undesirable to denominate the entire public debt in local currency. One of the reasons is that it could further affect the stability of the monetary system, as increased demand for the Kuna can cause the money price to rise.

According to the interest rate structure criterion, there are fixed rate debts and variable rate debts. Fixed rate debt prescribes a fixed annual fee as a percentage of the principal that the borrower pays to the lender as compensation for disposing of his financial assets. The basic interest rate is related to one of the reference interest rates in the international financial market, e.g. EURIBOR (Emmi-benchmarks, 2020), LIBOR (Global-rates, 2020) or to the inflation rate. In case interest rates are expected to decrease in the market, borrowing at the variable interest rate is preferable. The variable interest rate is linked at a fixed premium to one of the reference interest rates. According to the latest data, the Croatian National Bank (hereinafter: the CNB) will assume the calculation and publication of the National Reference Rate (hereinafter: the NRR). The NRR is one of the significant reference interest rates in the Republic of Croatia calculated and published by the Croatian Banking Association (CBA). The calculated rates will be published by CNB for the first time in May 2020 in accordance with the established publication calendar. It will also publish a methodology for calculating NRR on its website. The CNB's new role in the calculation of the NRR and the use of data provided by banks and savings banks to the CNB as part of its regular reporting have been further elaborated in the Draft Law on Amendments to the Law on credit institutions, after the public consultation (Croatian National Bank, 2020).

According to criterion of marketability of instruments, public debt can be marketable and non-marketable. Marketable debt can be divided into debt in foreign ownership and foreign currency debt. The difference between the two is that the former belongs to non-resident investors, whereas foreign currency debt means the amount of debt issued through the money

market, i.e. bonds issued with the payment of principal and interest rate in foreign currency. Government securities have traditionally been considered as marketable debt instruments. Short-term marketable securities include treasury bills, commercial papers and other short-term instruments (e.g. short-term deposits, overnight borrowings, etc.). They are used to cover the need to finance government budget deficits or debt repayments during the fiscal year, but also as assistance to the Central Bank in maintaining the liquidity of banks, the non-banking sector or the impact on short-term interest rates. Maturity for all of them is less than a year. Non-marketable debt instruments cannot be traded on the secondary market. They are intended for small individual investors without any experience in investing in government securities. An example are savings bonds that contribute to the diversification of government debt instruments, but are disadvantageous in the case of rising interest rates. Should liquidity problems arise, investors have the option of offering to buy the bond from the issuer before its maturity date. In addition, non-marketable debt instruments are financial commitments taken over from public companies, as well as loans from central government banks, commercial banks or international financial institutions (Tatomir, 2009, 4).

2.2. Legal framework for public debt management

The Budget Act (Official Gazette 87/2008, 136/2012, 15/2015) prescribes the basic objective of borrowing and debt management, and aims at ensuring the financial needs of the state budget by achieving the lowest medium and long-term cost of financing while assuming a certain degree of risk. This is necessary to contribute to the achievement of the established fiscal projections, to ensure the sustainability and optimal structure of the debt, and to achieve the objectives set by the debt management strategy. Borrowing is carried out for the purpose of financing the budget deficit, investment projects and special programs (subject to approval by the Croatian Parliament), repayment of government debt, settlement of payments due related to government guarantees, management of budget liquidity and the purpose of covering CNB requirements for international reserves. The Croatian Parliament, through the Law on Execution of the State Budget, which is passed annually together with the state budget, determines the total amount of new government debt and state guarantees that can be taken over or issued during the financial year. The Croatian Parliament reports twice a year, through a semi-annual and annual report on the execution of the state budget, on borrowing in the domestic and foreign markets of money and capital, as well as on state guarantees and expenditures under state guarantees. The Budget Act prescribes restrictions on short-term and long-term borrowing for local and regional self-government units, and the Law on Execution of the State Budget regulates the powers of the Government when deciding to approve long-term borrowing of a local and regional self-government unit. A unit of local and regional self-government may in the long run only be indebted for an investment financed from its budget, which is confirmed by its representative body, with the prior approval of the Government, and upon the proposal of the Minister of Finance (Ministry of Finance, 2019, 5).

2.2.1. Financing account

It is part of the budget showing government debt, debt repayments, how the budget deficit will be financed, and how the budget surplus is planned to be used. It can be clearly seen how high the proceeds are and which proceeds are from financial assets and borrowings, expenditures for financial assets and for repayment of credits and loans. The highest amount which the Government of the Republic of Croatia can borrow on the domestic and foreign markets of a given year is also prescribed. It provides an insight into ways of financing increased spending,

i.e. ways to invest in cases of increased earnings. There are four basic ways to finance the budget deficit:

1. Borrowing from the Central Bank - taking a direct loan from the Central Bank or selling government securities to the Central Bank. This type of borrowing is avoided because it affects the inflation rise. In many countries, it is banned by law in order to preserve the stability of the domestic currency and the stability of prices.

2. Sale of state property – it helps in lump sum reduction of public debt in extraordinary circumstances. An example for this is the privatization of state-owned enterprises. It is more often in the transition countries, and the current consumption is financed through lump sum financing instead of the capital investments and the value of state wealth is being reduced.

3. Borrowing in the domestic financial market - interest rates on loans increase as demand for loans increases. It can lead and to crowding out and reduction of private investment because it makes them more expensive.

4. Borrowing abroad - the outflow of funds abroad and the great potential for the appearance of illiquidity abroad.

3. Public Debt of the Republic of Croatia

The public debt of our country can be defined as the sum of the debt of the state budget, extra-budgetary funds and units of local and regional self-government. It represents an alternative to tax in financing government expenditures and is, as a rule, a voluntary market relationship between creditors and the state. In this way, by borrowing the government defers payment of costs of the today's consumption for the future with the associated interest. For the most part, it is the legacy of the former Socialist Federal Republic of Yugoslavia (hereinafter referred to as SFRY), which has ceased to exist as a subject of international law. The former SFRY republics declared their independence, they were recognized by the international community, and the process of the distribution of Yugoslav foreign debts began. The International Monetary Fund (hereinafter referred to as the IMF) has assigned to all the countries of the former Yugoslavia appropriate quotas, which were based on the GDP per capita. Thus, 28.49% of the assets and debts of the former state were recognized in the Republic of Croatia. For example, Slovenia accounted for 16.39%, Bosnia and Herzegovina 13.2%, Macedonia 5.4%, and the remaining 36.52% the rest of the Federal Republic of Yugoslavia. Part of the debts of the former state to the creditor countries members of the Paris Club was taken over by signing of the "Agreed Minutes on Consolidation of the Debt of the Republic of Croatia", of March 21, 1995 in Paris. Signing of the "Basic Agreement with the Chairman of the London Club" on April 26, 1996 played an important role. The signing and implementation of the agreement with the London and Paris Clubs marked Croatia as a credible debtor. This also meant its integration into the global financial markets. At the end of 2000, debt to the London and Paris Clubs accounted for 20.8% of its total external debt (Duspara, 2002, 87). Croatia inherited USD 2,831.7 million of debt, and inherited the second largest share of debt among all former SFRY republics after Serbia. Although it is not contested that these funds were spent in Croatia, the problematic nature of inherited debt stems from the fact that the criteria for borrowing and the criteria for prioritizing investment projects were transparent. In addition, they were not based on market economy principles and were not in line with the strategy for the long-term development of Croatia as an independent republic (Babić, 1997, 89).

3.1. Drivers of public debt

The drivers of public debt show which are the weaknesses in public finance management, what has led to an increase in debt, and what needs to be done in order to shape its management policy more successfully. The main causes of continuous budget deficits are their structure and height. The excessive deficit of Croatia in 2014 is mostly due to the height consolidated general government budget deficit. In 2015, Croatian level of public debt exceeded the average of the European union (hereinafter: the EU) and it also had the highest average cost of central government debt in the Union (4.6%) (Andabaka, Družić, Mustać, 2017, 465). To ensure the sustainability of public finances, fiscal consolidation measures need to be carefully selected, public debt management improved and public debt restructured (Andabaka et al, 2017, 484). The dynamics of public debt is determined by three main factors: the avalanche effect includes the common effects of payment of interests on accumulated debt and rates of real GDP growth and inflation. Rising levels of public debt may lead to rise in interest rates, the effect of crowding out of private investments due to higher borrowing costs. The increase in public debt in the Republic of Croatia from 2009 to 2014 resulted in higher interest rates. After the interest rates have risen, so did the mistrust of potential investors in the Croatian economy, which directly contributed to the decline in investment during that period; the part of the change in the public debt-to-GDP ratio not covered by the previous two factors is the primary balance of the budget, which includes both interest expenditure and deficit-debt adjustment or the adjustment of stocks and flows.

3.2. Indebtedness of the Republic of Croatia - Findings from the European Commission Report

The European Semester is an annual cycle of economic and budgetary policy coordination in the EU directing the EU countries before they make political decisions at national level. They are directed in the context of the Stability and Growth Pact in the case of macroeconomic imbalance procedure. The European Semester also serves to implement the Europe 2020 strategy. It was launched in 2011 to reduce the impact of the economic crisis and stimulate economic growth in the EU. Each autumn the European Commission publishes an Annual Growth Survey outlining the overall economic priorities for the EU for the coming year. It also publishes a Warning Mechanism Report analysing possible macroeconomic imbalances in the Member States. In February it issues country-specific reports on overall economic and social progress and proposes country-specific recommendations based on an assessment. EU countries are expected to reflect in their budgetary and political plans for next year the recommendations and implement them in the next 12 months (European Union, 2019, 1).

The last European Semester, adopted in February 2019, presents an assessment of Croatia's progress in implementing structural reforms and preventing and eliminating macroeconomic imbalances, and the results of detailed reviews in accordance with Regulation (EU) No. 1176/2011. Sustained economic growth is a major challenge for Croatia. Although it is above the EU average, economic growth in the Republic of Croatia is moderate and is gradually approaching a very slow potential growth rate. Macroeconomic imbalances are being reduced, thanks to a positive economic environment and prudent management of public finances. Favourable economic prospects could be used to accelerate structural reforms, which would spur potential growth. Reforms should be aimed at maintaining positive developments in the labour market and creating a business environment conducive to investment and higher productivity growth. Economic recovery continued, largely due to strong domestic demand. Personal consumption continues to be high as households have higher disposable income due

to increased employment and wages. Public investments remain low, which is slowing down the overall investment activity. Although export of goods and services continues to grow, there are signs of slowing down, and imports are also increasing. Ten years after the financial crisis, the economy could achieve the level of GDP lost in the recession. Further stable employment growth is expected. Due to low inflation, and partly due to consumption tax reduction in 2019 and 2020, household consumption is expected to continue to be a major driver of GDP growth. However, the contribution of investment will increase over time. In particular, high liquidity and interest rate reductions are expected to continue to benefit the private sector. In the public sector, with the approaching end of the programming period, an increased withdrawal of EU funding is expected. Due to the continued deterioration of the trade balance, a growing negative impact of the rest of the world sector on growth is expected. Generally, it is estimated that a moderate real GDP growth is supposed to be 2.7% in 2019 and 2.6% in 2020, respectively. Croatia has made some progress in implementing its 2018 recommendations. Reasonable government expenditure and borrowing have led to a reduction in the debt-to-GDP ratio. After a long delay, measures are being adopted to strengthen the institutional framework for managing public finances.

During the prolonged recession, general government debt more than doubled due to the deficits and costs of state-owned enterprises. The debt-to-GDP ratio has been declining since 2015 and has since fallen by more than 12 percentage points, to an estimated 73.5% in 2018. Its decline was driven by economic growth but also by expenditure control. However, there is no indication that, despite its current sensitivity to exchange rate fluctuations, it is exposed to the risks of "fiscal stress" in the short term and reducing government risks results in reduced debt service costs. However, sustainability risks are higher in the long run, due to the effect of an aging population (European Union, 2019, 5).

As a result of prudent fiscal policy and strong GDP growth, Croatia's public debt ratio has been declining for several years in a row. In the third quarter of 2018 the debt-to-GDP ratio was 74.5% compared with a high of 86.2% in the first quarter of 2015. The decrease was driven mainly by a combination of GDP growth and significant improvements in the general government balance. The structural surplus amounted to 0.7% of GDP in 2017, which means that Croatia is still well above its medium-term budgetary objective (-1.75% of GDP). The implementation of contingent liabilities is expected to have a strong, albeit temporarily negative effect on the government budget balance (more than 1% of GDP) during 2018 and 2019, which will also have an effect on debt. In addition, since the state uses fiscal space to reduce taxes, fiscal policy is expected to become pro-cyclical. However, it is expected that the debt ratio will continue to decline and, thanks to small surpluses and GDP growth, will decline to 68.2% in 2020 (European Union, 2019, 23). More moderate growth is reported while output levels have finally reached pre-crisis levels. Having reached its highest level of 3.5% in 2016, real GDP growth rate slowed down to 2.9% in 2017, and is estimated to have further decreased to 2.8% in 2018. Domestic demand was driven by high personal consumption and strong private investments due to continued favourable financing conditions. Available data from 2018 indicate a slowdown in the upward trend of goods and services exports, while at the same time recording a strong growth in imports of goods and services, albeit at a slightly slower pace, further reducing the effect of net exports on growth. The reduction of private and public sector debt and their exposure to currency and interest rate risk continues. High levels of debt continue to burden the economy, despite a significant improvement in the situation, as the level of private debt is below the level of the prudential threshold and a permanent reduction in public debt is recorded. The corporate sector, however, is over-indebted and burdened with bad credits. External imbalances were further reduced due to the high current account surplus. Liabilities denominated in the foreign currency are also decreasing, suggesting less exposure to exchange rate risk. The unemployment rate is noticeably reduced, although employment

growth is not the only reason: going away to work outside Croatia is an important factor in this decrease. But labour market participation is well below the EU average (Potočnik, Spajić-Vrkaš, 2017, 144). The structure of the Croatian debt has improved in several respects. In recent years, Croatia has used a low interest rate environment to refinance maturing bonds and loans at lower interest rates. The implicit interest rate on public debt in 2017 was at a record low and decreased to 3.4% compared to 4.2% in 2015. In addition, due to the prolongation of the average maturity of outstanding debt and higher issuance of debt in national currency, the vulnerabilities associated with government debt were somewhat decreased. Similarly, the share of debt with fixed interest rates has increased, thereby reducing the exposure to interest rate shocks.

3.3. Recommendations of the Council of the European Union

On April 18, 2019, Croatia submitted its National Reform Program for 2019 and its Convergence Program for 2019. When developing programs for the use of European Structural and Investment Funds for the period 2014-2020 the relevant recommendations of the Commission of the Council of the EU for Croatia in 2019 and 2020 are as follows:

> 1. Strengthen the budgetary framework and the monitoring of potential commitments at central and local level. Reduce the territorial fragmentation of public administration and simplify the functional distribution of competences.
> 2. Reform the education system and improve access to education and training at all levels as well as improve their quality and relevance to the labour market. Consolidate social benefits and improve their impact on poverty reduction. Strengthen labour market measures and institutions and improve their cooperation with social services. In cooperation with the social partners, introduce harmonized frameworks for determining salaries in public administration and public services.
> 3. Focus the investment policy on research and innovation, sustainable urban and rail transport, energy efficiency, renewable energy sources and environmental infrastructure, taking into account regional differences. Increase the capacity of competent authorities for developing and implementing public projects and policies.
> 4. Improve corporate governance of state-owned enterprises and intensify sales of these enterprises and inactive assets. Improve the prevention and sanctioning of corruption, especially at the local level. Reduce the length of court proceedings and improve electronic communication in courts. Reduce the largest para-fiscal charges and over-regulation of the products and service market (Council of the European Union, 2019, 1).

3.4. Fiscal Policy Commission

The Fiscal Policy Commission was established in 2013 by the Decision establishing the Fiscal Policy Commission. It is established as a professional and independent body with the aim of improving the public finance system and monitoring the application of fiscal rules set out in the Law on Fiscal Responsibility, which will contribute to ensuring and maintaining fiscal discipline, transparency and medium and long-term sustainability of public finances (Decision establishing the Fiscal Policy Commission, 2013, 1). It is composed of 6 members who, in addition to the President of the Commission, are appointed by the Croatian Parliament at the proposal of the Committee on Finance and the State Budget for a period of five years and after their term of office they may be reappointed. The main tasks of the Commission are to: review and evaluate the implementation of fiscal rules set out in the Law on Fiscal Responsibility in the state budget and financial plans of extra-budgetary users of the state budget for a budget

year and projections for the next two years; review and evaluate the implementation of fiscal rules set out in the Law on Fiscal Responsibility in the amendments of the state budget and financial plans of extra-budgetary users of the state budget, in the semi-annual and annual report on implementation of the state budget and financial plans of extra-budgetary users of the state budget, in the documents adopted by the Government of the Republic of Croatia related to the process of drafting the state budget and the budget of local and regional self-government units and financial plans of extra-budgetary users and projections for medium-term budgetary framework as well as review and compare the macroeconomic and budgetary projections with the latest available projections of the European Commission in the documents adopted by the Government of the Republic of Croatia or documents proposed by the Government of the Republic of Croatia to the Croatian Parliament related to process of drafting the state budget and the budget of local and regional self-government units as well as financial plans of extra-budgetary users of the state budget for medium-term budgetary framework and determine catastrophe, i.e. larger economic disturbances influencing significantly the financial situation of the budget postponing temporarily the implementation of the fiscal rule provided that fiscal sustainability in medium-term framework has not been jeopardized. (Decision on the Establishment of the Fiscal Policy Commission, 2013, 6).

The position of the Commission, since its last session held on November 5, 2019, when it was discussing the Proposal of the State Budget of the Republic of Croatia and the financial plans of extra-budgetary users for 2020 and the projections for 2021 and 2022, is that the macroeconomic projections from the Budget Proposal can serve as credible a basis for budget planning and for considering the growth of budget revenues. The 2020 projection is the same as the European Commission projection of June 2019. Macroeconomic projections indicate that domestic demand, especially personal consumption and gross fixed capital formation, will continue to be a major generator of growth in the Croatian economy. The contribution of net exports to growth is expected to be negative, which opens risks for sustainability of economic growth, especially in the absence of more serious structural reforms. The Commission warns of the need to limit the growth of budget expenditures financed from general revenues, which continue to grow faster than nominal GDP growth in 2020. According to the plan, public debt should be reduced from 71.3% of GDP in 2019 to 68% of GDP in 2020, and further to 65.0% in 2021 and 61.6% in 2022, and nominal reduction of public debt is expected (Croatian Parliament, 2013, 3).

4. Conclusion

The state borrows to raise funds for financing capital projects, to the repay the existing debts, implement the stabilization policy measures, smooth the tax burden in a certain period of time. Like most EU countries, we have been "pressured" by the recession. For many years, we have been borrowing to finance a budget deficit created by a negative balance of revenues over expenditures. The greatest danger to the country was posed by increased borrowing abroad and using loans to finance consumption rather than investment. In addition to the existing natural resources, a demographic renewal of society is needed without which it is impossible to achieve stronger economic growth. Croatia's accession to the EU has boosted exports of goods, but we are still lagging behind the leading transition member states. According to the World Bank's Doing Business project, which is carried out on an annual basis and includes research of 190 economies and analysis of 11 different indicators, the most recent report from May 1, 2019 shows that the Republic of Croatia is ranked 51st. This indicates that even though we are making progress, it is slow and other countries continue to outstrip us in the overall rankings. Slovenia is ranked 37th, Serbia is also ahead of us, and the EU's best- ranked country is Denmark in the 4th place.

The most important indicator of progress is improvement of the management of public debt, increase in the transparency of institutions responsible for managing it, and establishing of the accountability of institutions responsible for borrowing and issuing guarantees above the prescribed amounts. Furthermore, fiscal policy needs to focus on reducing non-productive public spending and the tax burden. Forecasts are positive, further improvement of the investment climate is expected in the conditions of continuation of good business results and less burdened balance sheets of the enterprise sector, favourable movement of the economic sentiment indicator, as well as maintaining favourable financing conditions, which will certainly be positively influenced also by the recent increase in credit rating.

Economic growth is expected to continue at slightly slowing rates in the context of maintaining the positive gap in gross domestic product, which will be based solely on the contribution of domestic demand, while the contribution of net foreign demand will be negative. Personal consumption will continue to be a major driver of the country's economic recovery.

NEW LAW ON TOURIST BOARDS AND PROMOTION OF CROATIAN TOURISM IN FUNCTION OF TOURISM DEVELOPMENT OF THE SLAVONIAN POSAVINA

ABSTRACT

The new Law on Tourist Boards and Promotion of Croatian Tourism, which came into force on January, 1, 2020, prescribes the possibility of associating among local and regional tourist boards and local self-government units, if no tourist board has been established for the area of the local self-government unit, that by signing mutual interest agreements, with the aim of joint development of the tourist product and promotion of the destination. Following this, representatives of three tourist boards and mayors of seventeen municipalities that have settlements in the Slavonian Posavina area, and are currently networked in the tourist destination "My beautiful Slavonia near the Sava", have prepared a new cooperation agreement in accordance with the guidelines of the Croatian Ministry of Tourism, so that, after verification the agreement by the Ministry, could also use funds from the Croatian National Tourist Board Fund for joint tourist boards/local self-government units to realize joint marketing activities. The primary research conducted among the signatories of the agreement in the form of a questionnaire aimed to identify the promotional activities of the Destination, which, in the opinion of the respondents, should be financed by the Croatian National Tourist Board. The results of the research will assist the tourist boards and local self-government units in the Destination in planning the tourist development of individual cities and municipalities in the Destination, especially in the sense of a more realistic view of possible sources of financing of tourism projects.

Key words: *tourist destination; consensual association; My beautiful Slavonia near the Sava; marketing activities.*

1. Introduction

Speaking about the tourist destination, the main focus is on the one hand, at the resource base that will act as an attractive force for tourists, and on the other hand, at the appropriate infrastructure that will serve the needs of tourists (Lončarić, B., 2012, 140). A tourist destination is a place where visitors temporarily stay for interactions and attractiveness (Pike, S., 2008, 26,33), and it is also possible that a wider area represents a functional entity (Vukonić, B., 1996).

Most empirical research does not bother with the definition of tourist destination at all, but simply deals with sites where visitor traffic takes place or where it might take place (Hitrec, T., 1995, 43-51), meaning sites that represent geographical ares with similar characteristics that

have attractive, communicative and receptive, and all those natural, social, atropogenic, cultural-historical and traffic factors, as well as those necessary for accommodation and food, rest, recreation and entertainment of tourists (Dobre, R., Župan-Rusković, P., Čivljak, M., 2004, 4). Looking in the tourist sense, the "boundaries" of tourist destinations are determined by the market, so they must not formally stand between locally internal and locally external tourism opportunities (Magaš, D.,1997, 22).

On the global tourism market there is an increase of tourists' interest for authentic and new experiences closely related to the local culture and lifestyle in the destinations they visit (Bakan, R., Tubic, D., Randelj, J., 2018, 701). Tourists who are persuaded to visit a destination should be offered a unique experience (Gorše, M., Kutnjak, G., Grčić-Fabić, M., 2016, 185), what is the responsibility of the destination management, which should recognize the specifics of the destination by offering them to the clearly defined market segments through attractive and responsive packages of services and tangible products (Bartoluci, M., Hendija, Z., Petračić, M., 2016, 881). In this regard, destination managing should be viewed as tourist attractions that engage local interests within meaningful business cooperation with the offer holders for the purpose of creating a destination product (Magaš, D., 2008, 9).

Connecting geographically to a destination managed uniquely brings many benefits such as enriching own resource base, greater efficiency in marketing activities on the domestic and international markets, stronger image, more customers and higher revenues, more efficient distribution and sales of products. The geographic group of directly related companies and related institutions in a particular area (cluster) is linked by similarities and complementarities (Porter, M.E., 2008), and today there are sufficient empirical evidences to indicate that innovation and competitiveness growth are mostly geographically concentrated (Dragičević, M., Obadić, A., 2013, 10).

In the context of globalization and increasing competition, cooperation and integration in the tourism sector, especially of the less developed areas of tourism, is a necessity for survival in the tourism market (Christensen, P., Mclntyre, N., Pikholz, H., 2002, 19-21). Networking is primarily conditioned by the heterogeneity of various activities related to accommodation, catering, transportation and more; the need to transfer knowledge and structural integrations in the function of tourism development and to enhance the strategic competitiveness of the destination (Scott et al., 2008, 90), and it results in qualitative and quantitative benefits for the economic entity, community and destination (Morrison, A.M. et al., 2004, 198).

2. Tourist destination "My beautiful Slavonia near the Sava" as an example of good practice

The Ministry of Tourism of the Republic of Croatia, through the pilot project "365 Croatia", started in 2014 (Lončarić, 2016, 167), identified activities that should be undertaken in order to make better use of resources during the pre- and post-season (Lončarić, B., Ružić, D., 2015; 282), which implied the joint activities of entities networked in tourist destinations. Although the project did not convene in practice (Lončarić, B., 2017, 854), primarily because the Croatian National Tourist Board, until the entry into force of the new Law on Tourist Boards and the Promotion of Croatian Tourism (NN 52/2019), allocated funds to improve activities of tourist boards in underdeveloped tourist areas exclusively to the tourist boards of individual counties, even in cases involving the implementation of a specific program/project in several administrative areas (Croatian National Tourist Board, 2019, 2), the project has become the

starting point for connecting entities engaged in tourism and belonging to areas with similar geographical features, climate, historical settlements, etc., regardless of the administrative structure in terms of territorial affiliation to the same county.

Thus, after the initial meeting held in March 2015, at the urging of the Mayor of Slavonski Brod as the President of the Tourist Board Slavonski Brod, the project of networking three cities and seventeen municipalities gravitating to the Sava River in the Brodsko Posavska and in the Vukovarsko srijemska County was launched, and the cities and municipalities networked into a joint tourist destination "My beautiful Slavonia near the Sava", all within the framework of the before mentioned project of the Ministry of Tourism. During the same month, a cooperation agreement was signed and cultural and eno and gastro tourism were identified as key tourism products; Austrian and German markets as key geo markets, and the Slavonski Brod Tourist Board as a legal entity authorized to represent the Destination. In May 2015, the Croatian National Tourist Board awarded the Destination the project designation till June 2018 (Slavonski Brod Tourist Board, 2020, 4,5).

After the expiry of the cooperation agreement in June 2018, cooperation between the cities and municipalities of the Destination continued and in September 2018 a new cooperation agreement was signed for a further period of three years, all in the function of further realization of joint projects of the Slavonian Posavina, as a unique tourist area, considering its geographical features but also its cultural and historical heritage. The Destination continued to operate under the name "My beautiful Slavonia near the Sava" and in the meantime numerous joint projects were implemented, with emphasis on promotional activities such as publishing of promo material and online advertising, as well as marketing infrastructure activities such as video recording, creating photo galleries and other.

3. New legislation in order to promote the development of the tourist destination "My beautiful Slavonia near the Sava"

The new Law on Tourist Boards and Promotion of Croatian Tourism which came into force on January, 1, 2020, encourages associating of local and regional tourist boards and local self-government units (Article 54), if no tourist board has been established in the area of the local self-government unit, in order to jointly carry out one or more activities aimed at developing a tourism product and promoting the destination so that in joint activities they act as a single destination (Article 53, paragraph 1 of the Act). The concept of a single tourist destination is defined in Article 2, item 1 of the mentioned law and means "market and tourist valorized spatial unit which is the goal of tourist trips and encompasses the area of one or more units of local or regional self-government".

In order to encourage associating, through the co-financing of projects and programs of associated tourist boards, the Croatian National Tourist Board will, in accordance with the provisions of Article 12, paragraph 3 of the Law on Memberships in Tourist Boards (NN 52/2019) and the provisions of Article 20, paragraph 1 of the Law on Tourism Tax (NN 52/2019), grant the funds from the Associated Tourist Board Fund, if associating has been carried out in accordance with the provisions of Article 53, paragraph 7 of the Law on Tourist Communities and the Promotion of Croatian Tourism, that with the prior consent of the Ministry of Tourism.

At the beginning of January 2020, the Tourist Board of the City of Slavonski Brod, on behalf

of the tourist destination "My Beautiful Slavonia near the Sava", requested the Ministry of Tourism the prior consent for associating, in order to comply the cooperation between the tourist boards and municipalities in the Destination so far with the provisions of the new Law on Tourism Boards and the Promotion of Croatian tourism, all with the goal of creating preconditions for the use of funds from the Associated Tourist Board Fund. A proposal of the text of a new co-operation agreement was submitted to the Ministry as an attachment of the request, but the Ministry had not yet made a statement on the request.

4. Results of the primary research within the tourist destination "My beautiful Slavonia near the Sava" from the February 2019

During February 2019, a primary research in the form of an online questionnaire had been conducted to examine the views of representatives of cities and municipalities, tourist boards and the Destinations tourism sector regarding their interest in participating in the Destinations joint projects and the resulting benefits. 81 respondents (74.1% from the area of the Brodsko Posavska County and 25.9% from the area of the Vukovarsko Srijemska County) had participated in the research, which makes 54% of the total number of potential respondents to whose e-mail addresses the questionnaire had been sent. Looking at the activity of the respondents, 49.4% had been from the sector of providing accommodation and catering services; 14.8% had been representatives of local government and self-government units; 11.1% of them had been representatives of tourist boards; 8.6% owners of travel agencies, while the remaining 16.1% had belonged to other sectors, with the largest share of trade.

The results of the research had showed that, when it comes to tourism products of the Destination, 59.3% of the respondents had singled out gastronomy and oenology and manifestations as a key tourist offer, while 35.8% had considered culture as a key tourism product. Regarding the need for cooperation of the tourist entities of the Destination, regardless of the administrative structure, and the need for a unified presentation in the tourist markets, 60.5% of the respondents had fully supported the cooperation regardless of the administrative structure, and 67.9% had fully agreed with the statement that Slavonian Posavina had all the characteristics of a complete tourist destination and as such had to be uniquely represented in the tourist markets (Lončarić, B., 2019, 771).

5. Results of the primary research within the tourist destination "My beautiful Slavonia near the Sava" from the February 2020

In February 2020, a new primary research was conducted, again in the form of an online questionnaire. Respondents were asked a total of 11 questions. In the first answer the respondents had to enter the name of the tourist board/municipality and in the second the function of the person completing the questionnaire. The third question was designed using the Likert scale, so respondents ranging from 1 (complete disagreement with the statement) to 5 (complete agreement with the statement) expressed their attitudes regarding cooperation between tourist boards and municipalities in the area of the Destination in the coming period. The further eight questions were answered by ranking according to the order of priority marketing activities and the need of financing them by the Croatian National Board. Ranking started from the lowest and moved in the direction of the highest priority.

The research involved 17 respondents (accounting for 85,0% of the total number of representatives of tourist boards, ie municipalities within the Destination), of which 5

representatives of tourist boards and 12 representatives of municipalities, ie 11 respondents from the area of the Brodsko Posavska County and 6 respondents from the Vukovarsko Srijemska County. The results of the research are presented in figures and explained below.

Figure 1: Cooperation between tourist boards and municipalities in the Destination, the question and the answers

Do you agree with the statement that cooperation between tourist boards and municipalities in the area of the Destination should be developed in the coming period, regardless of whether the Croatian National Tourist Board will provide financial support for the implementation of joint projects? (Possible answers in the range of 1 – I disagree to 5 – I completely agree.)

Figure 9: Designing and installing of new tourist signposts and repairing of destroyed signposts as a priority marketing activity within the Destination, the question and the answers

Rate it from the range of 1 (the lowest grade) to 5 (the highest grade) "designing and installing of new tourist signposts and repairing of destroyed signposts" as a priority marketing activity within the Destination.
Source: Self-conducted research, February, 2020

As can be seen from the Figure 1, as many as 70.6% of the respondents fully agree with the statement that in the forthcoming period the cooperation of the tourist boards and municipalities within the Destination should take place regardless of whether the Croatian National Tourist Board will provide financial support for the implementation of joint projects. However, none of the respondents expressed the opinion that in case of not getting support from the Croatian National Tourist Board, the cooperation should be terminated. In addition, as many as 76.5% of the respondents consider as the top priority marketing activity "arranging of cyclotourism, thematic and educational paths in the Destination" (Figure 7), and 64.7% of them "online and offline advertising" (Figure 3); "raising the quality of visitors' information " (Figure 8) and "designing and installing of new tourist signposts and repairing of destroyed signposts (Figure 9). "Branding and labeling" (Figure 2) is of the highest importance for 58.8% of respondents, and "developing the Destination Strategic Marketing plan" (Figure 6) and "making souvenirs and promotional items with the Destination features" (Figure 5) for 41. 2% of respondents. 35.3% of respondents opted for „publishing promotional brochures" (Figure 4) as the priority marketing activity, primarily due to the fact that projects in this policy area were largely implemented in the past period (the promo brochure, the map and the paper bag of the Destination were published).

6. Conclusion

Tourist destinations acquire their image and position in the market based on a number of factors. While some factors are easier to change than others, such as leadership, development strategy, and destination resource management, other factors that shape a destination such as location, proximity to the market, climate and other important aspects are much harder to change (Avraham , E., Ketter, E., 2015, 347). The destination area must have an offer that will meet

the requirements of visitors of different categories in terms of age, ethnic and social background, occupation and more (Travis, AS, 1989), so there is a clear need for strategic and comprehensive destination level planning, which should be heavily relied upon cooperation and communication between stakeholders (Shtonova, I., 2011, 123).

In addition, government interventions into tourism are possible, primarily because tourism is a driver of economic development, which stimulates employment opportunities and is a labor-intensive activity, generates about 10% of world GDP, contributes to fiscal revenues, and gives the possibility of developing less developed areas through a redistributive policy based on combining tax levies and spending (Pike, S., 2008). State authorities can influence tourism in many ways, the most common being coordination related to formally institutionalized relationships between existing groups of organizations, interest groups and/or individuals, as well as legislation in the area of law enforcement that regulates tourism activity (Hall, CM, 2000).

With the new Law on Tourist Boards and Promotion of Croatian Tourism, which came into force on January, 1, 2020, the possibility of a consensual associating of local and regional tourist boards and local self-government units, if no tourist board has been established in the area of the local self-government unit, is prescribed, with the aim of joint development of the tourist product and promotion of the destination. In the wake of that, the representatives of three tourist boards and the mayors of seventeen municipalities that have settlements in the Slavonian Posavina area, and are currently networked in the tourist destination "My beautiful Slavonia near the Sava", have prepared a new cooperation agreement in accordance with the guidelines of the Ministry of Tourism. Assumig verification of the agreement by the Ministry, they will be enabled to use funds from the Associated Tourist Board Fund for tourist boards/local self-government units to realize joint marketing activities.

The research itself was conducted in such a way that the marketing activities, which should have been realized within the Destination, were determined according to the provisions of Article 32 of the Law on Tourist Boards and Promotion of Croatian Tourism which prescribed tasks of local tourist boards including the segments of products development; information and research and distribution, and according to the Rules on support for tourist boards in underdeveloped tourist areas (NN132 /17; 70/18).

The results of the research showed that the respondents primarily supported activities that were in the function of realization of projects in the field of "development and improvement of the tourist offer of the destination" (arranging of cyclotourism, thematic and educational paths; advertising; raising the quality of visitors' information; designing and installing of tourist signposts, brandig and laveling), while activities in the function of realization of projects in the field of improvement of tasks of tourist boards, such as developing the Strategic Marketing Plan, were of less priority. The results of the research also showed that the cooperation of tourist boards and municipalities in the Slavonian Posavina region, which realized joint marketing activities under the umbrella name "My beautiful Slavonia near the Sava", would continue, regardless of the financial support from the Croatian National Tourist Board, but also that the tourist boards and municipalities within the Destination were certainly expecting this support, primarily because the legal preconditions had been created for this purpose.

Although the results of the research clearly express the attitude of the respondents regarding cooperation in the segment of marketing activities, it should be noted that there were some

limitations when conducting the research. This primarily refers to the research sample, since only representatives of the tourist boards/municipalities, not representatives of the tourism sector, participated in the online research, but also to the influence of the subjective assessment of the respondents and the social desirability of the responses. Furthermore, the limitations of the research are related to the absence of pre-conducted research in the territory of Croatia, with the results that could be compared with the results of the research in question.

When it comes to open issues, further research will need to examine whether there will be an interest for further cooperation among tourist boards/minicipalities in the Destination if the Ministry of Tourism does not give its prior approval for associating and/or if the expected financial support from the Croatian National Tourist Board lacks. Furthermore, if funds from the state level are allocated, it is currently unknown in which way the allocation will be done, and how the use of funds will be justified. We expect that the same will be prescribed by the by-law of the Ministry of Tourism.

Dispate of limitations and open questions, the results of the research will assist the tourist boards and municipalities in the Destination in planning the tourist development of individual cities and municipalities in the Destination, that in the part related to a more realistic view of possible sources of financing for the implementation of tourism projects of priority common interest.

ROLE AND POSITION OF EUROPEAN REGIONS - ECONOMIC, POLITICAL AND LEGAL ASPECT

ABSTRACT

Within the thematic whole of the conference entitled "Regions", the aim of the paper is to analyse the role and position of European regions from an economic, political and legal point of view.

Regarding research methodology, in addition to the analysis and synthesis method, the following methods were used: comparative method (comparison of constitutional position of regions in Italy and Spain), historical method (historical review of regions), inductive and deductive method and secondary research.

The scientific contribution of this paper is expressed in an interdisciplinary approach to research (economic, political and legal).

The results of the study show that European regions have a significant impact on the economic, legal and political systems of certain countries. Their positive role is reflected in the economic system in which the regions are the backbone for the economic development of the modern state, as well as in the political system, where the regions are the basis for democracy and autonomy. The role of regions in the legal system is particularly important, given that most EU legislation is implemented at local and regional level.

Key words: regions, regionalization, regional differences, regional development.

1. Introduction

The success of economic development and optimization of living conditions of citizens depends on the territorial-political organization of the state. The territory where people live forms the framework for the political, economic and social activities of its citizens. In addition, the territory has a legal function that is expressed in the fact that certain rules apply to it. The diversity of territories in the European Union represents a potential for development, where the characteristic identities of local and regional authorities may be important. The effective use of European territory and resources is a key element of territorial cohesion, which can certainly have a contribution to the development of economies and infrastructure. This paper assumes that the regions represent the most desirable economic development units; they

implement the legislation of the nation state and the European Union, and represent important units in the political context of a particular country.

The paper consists of several interconnected parts. The introductory considerations are followed by a general overview of regions. The analysis of the European Union's focus on regions is addressed in the second part. This is followed by an analysis of the role and position of the regions from an economic point of view. The role and position of the regions from a political point of view is addressed in the third part. As part of the whole referring to the role and position of the regions, the legal and constitutional position of the Italian and Spanish regions will be compared.

2. Regions in General

The Community Charter for Regionalization defines a region as " a territory which constitutes, from a geographical point of view, a clear-cut entity or a similar grouping of territories where there is continuity and whose population possesses certain shared features and wishes to safeguard the resulting specific identity and to develop it with the object of stimulating cultural, social and economic progress " (Community Charter for Regionalization, Article 1). The term region is generally used for areas smaller than nation states, but larger than local units.

On the one hand, a region has a set of characteristics that link it to the whole of the country, and on the other hand, a set of (other) characteristics that make it specific. Different regional organizing practices are present in European countries. The status of regions differs not only from state to state, but within one state, there are regions with different constitutional positions and competencies.

3. European Union's Focus on Regions

The European Union's focus towards regions and regional structures has developed in parallel with the development of European cohesion policy. This was particularly evident with the signing of the Single European Act of 1986, when cohesion policy was also established in primary EU law, with the establishment of the internal market.

The Treaty of Lisbon, comprising of the Treaty on European Union (hereinafter referred to as the TEU) and the Treaty on the Functioning of the European Union (hereinafter referred to as the TFEU), strengthened the position of regional self-government and regions in the EU political system (Consolidated versions of the Treaty on European Union and the Treaty on the Functioning, 2016). In the above-mentioned basic act of the European Union and its appendices, regions and regional self-government are of particular importance and are mentioned in different contexts, in particular:

- the general principle of local and regional self-government in the European context is formally recognized for the first time (Article 4, paragraph 2 of the TEU),
- extension of the principle of subsidiarity to local and regional level (Article 5, paragraph 3 of the TEU),
- ensuring harmonious development by reducing the differences existing between the various regions and the backwardness of the less favoured regions (TFEU preamble),
- inequalities between the development levels of the various regions, which the Union aims at reducing (Article 174, paragraph 2 of the TFEU),
- different situations in different regions (Article 191, paragraph 2 of the TFEU),
- the economic and social development of the Union as a whole and the balanced development of its regions (Article 191, paragraph 3 of the TFEU), and
- projects for developing less-developed regions (Article 309, paragraph 1 of the TFEU), etc.

3.1. European Union Cohesion Policy

According to Barić, cohesion, i.e. regional policy of the European Union, is an investment policy aimed at increasing employment and competitiveness, increasing economic growth, improving quality of life and sustainable growth (Barić, 2016, 339).

The fundamental objective of the concept of European cohesion policy, i.e. economic, social and territorial cohesion, is laid down in Article 174 of the Treaty on the Functioning of the European Union, according to which the EU "in order to promote its overall harmonious development, the Union shall develop and pursue its actions leading to the strengthening of its economic, social and territorial cohesion". In order to achieve this objective, "in particular, the Union shall aim at reducing disparities between the levels of development of the various regions and the backwardness of the least favoured regions". Among the mentioned regions, "particular attention shall be paid to rural areas, areas affected by industrial transition, and regions which suffer from severe and permanent natural or demographic handicaps such as the northernmost regions with very low population density and island, cross- border and mountain regions." Under this treaty provision, cohesion policy is a solidarity policy and a key framework on the basis of which the EU can address the challenges of regional development (TFEU, Article 174, paragraphs 1-3).

European Structural and Investment Funds are one of the EU's fundamental instruments for implementing cohesion policy. In this regard, the results of the Mari Carmen Puigcerver-Peñalver research show that the Structural Funds have positively influenced the growth process of the regions. For example, their impact was much stronger during the first programming period than during the second (Puigcerver-Penalver, 179).

Bachtler and McMaster, in their research emphasized that regions (will) have an important role to play in the development and delivery of Structural Funds programmes. These arguments are situated within the new regionalism debates on the importance of regional and local actors engaging with, and advancing, economic development agendas, and the influence of the EU on regional institutional development. The scope for Structural Funds to develop the role of regions and encourage bottom-up, regional involvement in promoting economic development is based on several factors, linked to legitimacy, institution building, and capacity development (Bachtler, McMaster, 2007, 420). Other author share a similar opinion and believe that EU regional support through the structural funds has a significant and positive impact on the growth performance on European regions and, hence, contributes to greater equality in productivity and income in Europe (Cappelen, Castellacci, Fagerberg, Verspagen, 2003, 640).

The system of local and regional self-government, in addition to the central state level, in European countries forms an important component of the framework for managing regional development policy and largely determines the solutions regulated by regional development legislation.

Regional self-government is closely linked to cohesion policy. The fact is that cohesion policy contributes to strengthening the role of local and regional authorities at the EU level and in particular by extending cohesion to the territorial component. In this connection, Siniša Rodin points out: "It is obvious that the local and regional authorities of the Member States had a strong desire and need to emphasize the importance of territorial cohesion in the very title of the chapter (Rodin, Goldner Lang, 23). Similar is the view of Anamarija Musa, according to which "One of the most significant factors in the process of Europeanization in relation to subnational units is cohesion policy, which is aimed at reducing social and economic disparities between individual regions" (Musa, 2011, 109).

3.2. European Criteria for Regional Division of EU Member States into NUTS Units

In the European Union, there is an obligation to identify statistical territorial units according to the EU NUTS classification ("Nomenclature of Territorial Units for Statistics") for the identification and classification of spatial units for official statistics in the EU Member States, with the aim of comparing its regions. This is a part of the *acquis communautaire* that the candidate country must accept before accession. The main objective of the European Union is to identify less developed regions and reduce the gap between rich and poor regions.

The classification of statistical regions shall be determined in accordance with the NUTS methodology laid down in Regulation (EC) No 1059/2003 of the European Parliament and of the Council establishing a common classification of territorial units for statistics - NUTS (Regulation (EC) No 1059/2003) (amended by Commission Regulation (EC) No 1888/2005, Commission Regulation (EC) No 105/2007 and Commission Regulation (EU) No 31/2011 This Regulation is binding in its entirety and directly applicable in all Member States. All Member States of the European Union must accept the classification. NUTS classification divides a country into first-level NUTS regions, which are further subdivided into second-level NUTS regions, which are subdivided into third-level NUTS regions. Two further (local) levels are defined in accordance with NUTS principles, with only the fifth level defined in all Member States and generally corresponds to the term "municipalities." The fourth level is rarely defined and is adopted only by individual countries, thus making NUTS a five-level hierarchical classification (three regional and two local levels). In accordance with the already mentioned Regulation (EC), No. 1059/2003, the following criteria apply:

1) "Existing administrative units within the Member States shall constitute the first criterion used for the definition of territorial units. To this end, 'administrative unit' shall mean a geographical area with an administrative authority that has the power to take administrative or policy decisions for that area within the legal and institutional framework of the Member State." (Article 3, paragraph 1). This means that the first criterion for determining regions is the existing legal and administrative division of the territory of a particular Member State.

2) One of the main classification criteria is "population per region". For the purpose of achieving the appropriate NUTS level into which a class of administrative units in a Member State is to be classified, the average size of this class of administrative units in a Member State lies within the following population thresholds:
NUTS 1 – a minimum of 3,000,000 to a maximum of 7,000,000 inhabitants,
NUTS 2 – a minimum of 800,000 to a maximum of 3,000,000 inhabitants,
NUTS 3 – a minimum of 150,000 to a maximum of 800,000 inhabitants (Article 3, paragraph 2).

3) If there is no appropriate range for a given NUTS level in a Member State, in accordance with the population numbers listed above, this NUTS level is created by "adding up the corresponding number of existing smaller adjacent administrative units". This summation takes into account relevant benchmarks such as geographical, socio-economic, historical, cultural or environmental (Article 3, paragraph 5). This means that if a Member State does not have appropriate administrative units according to a certain number of population, statistical regions are formed by adding up several smaller administrative units.

Table 1: Nomenclature of Territorial Units for Statistics

Table 1 shows how the NUTS classification in the European Union covers different types of regions:

1) Political (self-governing) regions (Italy, Spain, France, Denmark, Poland etc.) in which the right to regional self-government is realized through the direct choice of their representative and executive bodies and other elements (finance, jobs, legal personality, etc.);

2) Statistical regions (Slovenia, Croatia, Hungary etc.) that aim to facilitate and harmonize the collection of statistical data on the basis of which different public policies can be conducted. They do not have their own bodies or institutions, but serve to gather information about the elements and the stage of development. The statistical regions agree with Eurostat, the statistical agency of the European Union.

3) Administrative regions (Federal Republic of Germany) have no self-governing elements and serve to better carry out the affairs of the central government in the entire state territory, and

4) Planning (development) regions (Greece, Romania, Bulgaria) – a type of administrative regions that are established mainly to stimulate and coordinate development activities. These regions usually have certain institutions, but without original political legitimacy. This implies that their members were not elected in special regional elections.

3.3. European Division of Regions by Level of Development

The categorization of regions is done according to their level of development. The classification of regions according to one of the three categories of regions is determined on the basis of the ratio of GDP per capita of each region, measured by purchasing power parity and calculated on the basis of Union data for a given period.

Regulation (EU) No 1095/2010 Regulation (EC) No 1303/2013 of the European Parliament and of the Council of 17 December 2013 laying down common provisions on the European Regional Development Fund, the European Social Fund, the Cohesion Fund, the European Agricultural Fund for Rural Development and the European Maritime and Fisheries Fund and laying down general provisions on the European the Regional Development Fund, the European Social Fund, the Cohesion Fund and the European Maritime and Fisheries Fund, and repealing Council Regulation (EC) No 1782/2003; Regulation (EC) No 1083/2006 subdivides the regions by development level into: (a) less developed regions whose GDP per capita is less than 75% of the average GDP of EU-27 countries; (b) transition regions, with GDP per capita between 75% and 90% of average GDP of EU-27 countries; 27 and (c) more developed regions, where GDP per capita is more than 90% of the average GDP of EU-27 countries. The allocation and concentration of European cohesion policy funds depends on the specific needs of individual regions. Thus, different interventions and different amounts of EU assistance are foreseen for different types of regions (Regulation (EU) No 1303/2013, Article 90, paragraphs 2-6). It is

important to emphasize that this Regulation entitles all previously mentioned regions corresponding to the NUTS 2 level to assistance from the ESI funds.

Main findings are that personal income matters more in poor regions than in rich regions, a pattern that still holds for regions within the same country. Being unemployed is negatively associated with life satisfaction even after controlled for income variation. Living in high unemployment regions does not alleviate the unhappiness of being out of work. After controlling for individual characteristics and modelling interactions, regional differences in life satisfaction still remain, confirming that regional dimension is relevant for life satisfaction (Grazia Pittau, Zelli, Gelman, 2010, 339).

4. Role and Position of Regions from an Economic Point of View

The term "region" is often associated with the term "development area", which represents a region or an area subject to the implementation of a specific national policy (regional policy). There are different forms of government intervention, from public and private sector investment subsidies to various forms of selective policies and discretionary assistance (Čavrak, URL). Defining the development areas was originally motivated by the reaction to the problem of uneven development of each country.

In the economic system, regions are the backbone for the economic development of the modern state. This statement is confirmed by the Declaration on Regionalism in Europe, which emphasizes that "Regions are an essential and irreplaceable element of European development and integration" (Declaration on Regionalism in Europe, 1996, Article 3). This means that the region is a suitable development and measurement area for the European Union.

In the context of development and economic cohesion, the previous statement is also confirmed by the European Parliament in its Resolution on Regional Policy and the Role of the Regions of 1988, which states that "the most appropriate geographical and institutional level for the implementation of regional policy – NUTS 2 is the regional level (European Parliament Resolution on Community regional policy and role of the regions, 1998, point 18). The NUTS 2 level is the most appropriate level for implementing a balanced regional development. For example, NUTS 2 regions include the following: Italian regions, Spanish autonomous communities, French regions, Danish regions, Polish regions "Województwa", Dutch provinces, German administrative regions "Regierungsbezirke", Austrian federal units "Länder", Belgian provinces, Croatian statistical regions etc. From a development perspective, it should be recalled that NUTS Level 2 regions are the largest project generators in the European Union. The importance of NUTS 2 regions as the most appropriate level has been proven for the following reason:

- the population (from 800,000 to 3,000,000) in the area is sufficiently large to allow adequate economic policy in the setting up and management of major infrastructure and services,
- this is the level closest to existing regional structures in many Member States,
- at this level, the quality of available statistics required is the best.

The EU's objectives defined in the Europe 2020 Strategy for smart, sustainable and inclusive growth can only be achieved if the territorial dimension of the strategy is taken into account, as the opportunities for development of different regions are different (Territorial Agenda of the European Union 2020, 4).

From an economic point of view, regions are increasingly interdependent, especially when addressing common problems (for example migrations, climate change, COVID 19 and various crisis situations). In doing so, territorial cooperation between European regions provides a framework for finding solutions to common problems.

4.1. Regional Development and its Indicators

In parallel with the development of European systems of local and regional self-government, important questions are raised for the successful management of regional development policy. Regional development as part of overall development, according to Zvonimir Lauc, is a broad term and can be seen as "a general effort to reduce regional inequalities through the support (employment and prosperity) of economic activity in the regions" (Lauc, 2011, 420). It is a process of sustainable economic and social development of a particular region, which is achieved through recognizing, stimulating and managing the development potential of the area. It aims at making the best use of the territorial potential of European regions. In doing so, it should be borne in mind that the opportunities for the development of individual regions are different. Regional development is one of the essential segments of overall national development, so it must be balanced.

There are several indicators of regional development: regional competitiveness index, development index and economic strength index. The model of the regional competitiveness index is based on statistical and perceptual pillars of competitiveness, which are divided into environment and business sector. It is used to compare the competitiveness between two or more regions. This means that a region has an absolute advantage in producing something good if it consumes less labour than other regions. The Regional Competitiveness Index is based on the definitions used by the European Union, according to which regional competitiveness implies the ability to create an attractive and sustainable business and living environment (EU Regional Competitiveness Index RCI 2013, 4). This includes the ability of a particular region to provide an attractive and sustainable environment for the business of the enterprise and the work and life of its residents. The Development Index is a composite indicator of measuring the level of development of regions over a given period, and usually contains the following information: average per capita income, average original per capita income, average unemployment rate, general population movement, population level of education (tertiary education) and an aging index (Decree on the Index Development, 2017, Article 2). Economic Strength Index is a composite indicator of the positioning of regions. It is calculated as the sum of weighted basic economic indicators in three-year averages and demographic projections to measure the degree of economic strength and economic potential of regions.

4.2. Impact of Regional Disparities on Economic Development

Regions are emerging as a generator of solutions to development disparities at European and national level. Regional disparities, in addition to increasing opportunity costs in less developed parts of the country, and in developed centres excess demand for development resources increases, which increases the overall costs of such a development model and reduces the national competitiveness of a country. Less developed regions impede the overall economic development of a particular country and determine significantly different living conditions and opportunities on the basis of belonging to a particular part of the national territory. It is a fact that regional inequalities are an economic problem. The underdeveloped areas are characterized by the following: a decline in economic development and growth, a decrease in market activities, a decrease in competitiveness, an increase in the model of development and a decrease in financial capacity.

Rajko Odobaša believes that regional development disparities and the further lag of certain regions and local self-government units are among the problems that most seriously burden the present and overall future development of the economy and society of a country. Although regional development disparities are undoubtedly the hardest hit regions with lower levels of development, they also suffer from more developed areas because of their backwardness, as

they are exposed to numerous economic, infrastructural, social, political, educational, health and other expenditures that burden them with income and weak development potentials (Odobaša, 2007, 163). Regional differences can lead to negative trends that, in the long run, could reduce the growth of those areas that are currently recording positive development indicators. The fact is that the economic development of successful ones is being challenged because the less developed environment is hampering them from taking advantage of all the potential gains from the growing economies of scale, but also in transforming heterogeneous comparative advantages. The price of this situation is also paid by those regions that achieve above average rates of economic growth and development. It is not uncommon that developed regions pay for the underdeveloped (Bavaria, Catalonia, and Flanders, as well as the former Yugoslav republics: Slovenia and Croatia).

5. Role and Position of the Regions from Political Point of View

By territorial division into local and regional self-government units, a large number of smaller "constitutional" (statutory) and political systems based on them are created in the country (Smerdel, Sokol, 2009, 404). Thus, one can speak of territorial - political systems (Brunčić, 2010, 43).

Local and regional units are part of a broader social and state system and are holders of public authority at local and regional level. Therefore, in the political constitution, the regions are the basis for democracy and autonomy. This is confirmed by the Declaration on Regionalism in Europe, emphasizing: "Regions, states and autonomous communities are above all pillars of democracy. They strongly support cultural diversity in Europe and are major partners in socio-economic development" (Declaration on Regionalism in Europe, 1996).

The policy of each country's territorial organization, which includes the distribution of political power to regional and local communities for the sake of equitable economic development and protection of individual and collective rights, is a key value of any democratic society (Sadiković, 2012, 176).

Political regions are regions in terms of elected regional authorities and have emerged as an expression of political will. They are the place where certain levels of government exercise their powers, especially with regard to regional policy. According to Vedran Đulabić, political regions are territorial units of the middle order that encompass an area between the local and state levels where there are a large number of local communities connected by regional identity and a special institutional structure with a greater or lesser degree of political autonomy. Among the main and most important elements of the existence of a political region are autonomous political processes, manifested in the existence of democratic, secret and multilateral elections for representative and / or executive bodies of the region, legal personality, own taxes and other autonomous sources of funding, a wide range of affairs within the scope of self-government, limitation of state control to the control of constitutionality and legality, possibilities for cooperation with other self-governing units at home and abroad (cross-border and interregional cooperation), etc. A special feature of the political region is the possibility of normative action, which is manifested in regionalized countries through the powers of enacting regional laws, and in decentralized countries in passing other general acts. When regions have the ability to legislate, there are usually several categories of so-called regional laws. These may be law enforcement laws passed by the central government, but without the possibility of elaborating them. Then, the laws that elaborate the laws passed by the central level and the laws which regulate, in the framework of the general principle of constitutionality and legality, completely different issues from the self-governing scope of the region (Đulabić, 2009, 912). The ideal requirement of a territorial division of a country is the correspondence of political regions with the statistical division, but very often this is not the case, as some political regions do not meet

the numerical criteria of Eurostat (for example some Polish regions). Thus, some countries, such as the Republic of Croatia, have parallel territorial units (political and statistical). Examples of coincidence of NUTS Level 2 political regions with democratically elected authorities exist in the following countries: Italy (NUTS Level 2 regions), Spain (NUTS Level 2 regions), France (NUTS Level 2 regions), Denmark (NUTS Level 2 regions), Poland (Województwa NUTS Level 2), the Netherlands (NUTS Level 2 Provinces), Belgium (NUTS Level 2 Provinces), Portugal (2 NUTS Level 2 Self-governing Regions) and Finland (1 Self-Governing Region).

6. Role and Position of the Regions from Legal Point of View

According to Arsen Bačić, in terms of constitutional law as well as international public law, the necessary elements of each state are political power or sovereignty, population, population or people and territory (Bačić, 2012, 97). The constitutional and legal framework of the regions guarantees an important role in the provision of public services to citizens, which is the essence of the self-governing scope of local and regional units. Establishment of regions can be performed via:
 - the constitution (for example Italy, Spain, Belgium), the constitution guarantees in principle the right to regional self-government, the right to regional organization and establishes a special procedure by which regions are established, and
- law (for example France, Poland, Denmark).

When it comes to the territorial effect of a regulation, that regulation regulates certain social relations and produces legal effects within the specific territory for which it was enacted. The importance of the role of the regions is reflected in the legal system. According to Dowling, "The sub-national level is becoming an increasingly important level of governance in nation-states, and its impact has been significantly strengthened given the European context. It should be emphasized here that approximately three quarters of all European legislation is implemented at the local and regional level of the Member States" (Dowling, 2003, 3).
 The position of the regions is essential in the overall system of organization of government in European countries. Constitutional and legal provisions give the regions powers of jurisdiction in certain public affairs. In this respect, European regions play an important role in providing and safeguarding public services at regional level. Such services are crucial for maintaining and developing territorial cohesion and for the advancement of the regional economy. As a typical competence of the region, the Declaration on Regionalism in Europe, Article 3 states the following: regional economic policy, regional planning, construction and housing policy, telecommunications and transport infrastructure, energy and ecology, agriculture and fisheries, education at all levels, faculties and research, culture and media, public health, tourism, leisure and sports, police and public order (Declaration on Regionalism in Europe, 1996, Article 3).

6.1. Constitutional Position of Italian Regions

The idea of regionalization in Italy came to prominence in 1947, when the Italian Constitution established twenty regions, as separate autonomous organizations with a considerable degree of autonomy. Accordingly, the Constitution establishes a vertical division of powers in the form of regionalism. Italy thus became the first European country to promote regionalization at the constitutional level.
 Chapter V of the Constitution of the Republic of Italy refers to regions, provinces and municipalities as constituent parts of the state structure and consists of 19 articles (114-133). The territorial organization of Italy under Article 114 (1) and (2) of the Italian Constitution is

organized into four levels of government, which are municipalities and cities, provinces, regions and states. Regions are self-governing units with their own statutes, powers and functions in accordance with the principles defined in the Constitution. The position of the Italian regions is determined by the Constitution, as follows:

- are recognized at the constitutional level as a constitutional category (Article 114, paragraph 1 of the Constitution),
- independently determine their own revenues and taxes (Article 119, paragraph 2),
- they have been accorded a special status of autonomy with respect to the central government, with broader competences than other regions within a given state (Article 116, paragraph 1),
- have the legislative power to undertake all activities not expressly stated to fall within the legislative scope of the State (Article 117 (4)),
- participate in the central government through representation in the upper house (Article 57),
- have their own bodies: regional council as regional legislative body, regional government and the president of the region (Article 121),
- represent political communities, within the meaning of elected subnational authorities (Article 122),
- represent territorial-political communities with legislative powers (Article 117, paragraph 1),
- have their basic acts -statutes (Article 123, paragraph 1), and
- have the right to self-government (Article 114, paragraph 2),
- their inhabitants have the status of national minorities, that is, they represent a people different in language, culture and other characteristics from the majority people in their respective country (Costituzione della Repubblica Italiana, 1948) Italian regions are not symmetrical. The Constitution distinguishes between 15 regular and 5 special status regions. Fifteen regular regions were formed, taking into account historical and geographical-economic criteria. Article 116 (1) of the Constitution constitutes the constitutional basis for the special status of autonomy of minority regions in Italy. The aforementioned constitutional provision stipulates that the special status of autonomy on the basis of special statutes adopted by constitutional law is granted to the following regions: Friuli-Venezia Giulia, Trentino-South Tyrol, Valle d'Aosta, Sardinia and Sicily.

6.2. Constitutional Position of Spanish Regions

Chapter VIII of the 1978 Constitution of Spain, which consists of 22 articles (137-158), applies to regions. The constitutional basis of the territorial division of Spain is set out in Article 137 (1) of the Constitution, according to which the Spanish State Territory consists of: autonomous communities (regions), provinces and municipalities. The said Chapter of the Constitution is divided into three sections:

- the first part (Articles 137-139) contains general principles,
- the second part, which also contains three articles (140-142), deals with local self-government and sets out principles relating to municipalities and provinces, and
- the third section, which contains 16 articles (143-158), is entitled "Autonomous Communities" and, among other things, addresses the specific status of these communities. All of these units enjoy the autonomy to manage their personal interests.

The constitutional position of the Spanish Autonomous Communities (including minority regions) is characterized by:
- are recognized at the constitutional level as a constitutional category (Article 137 of the Constitution),
- have a constitutional right to autonomy (Article 2), particularly financial autonomy (Article 156) and tax autonomy (Article 157),

- on the basis of the constitution, they have been accorded a special status of autonomy with respect to the central government, with broader competences than other regions within a given state (Article 151, paragraph 1),
- have constitutionally defined powers (Article 148),
- in accordance with the principle of subsidiarity, competences not listed in the Constitution belong to autonomous communities on the basis of their statutes (Article 149, paragraph 3),
- participate in the central government through representation in the upper house (Article 69),
- have their own bodies (legislative assembly, government council with executive and administrative functions, the president and the High Court of Justice (Articles 152 and 154),
- represent political communities, within the meaning of elected subnational authorities (Article 152),
- represent territorial-political communities with legislative powers (Article 152),
- have their basic acts - statutes (Article 146, 147),
- have the right to self-government (Article 148),
- some regions have a special status, since most of their population have the status of national minorities, that is, they represent a people different in language, culture and other characteristics from the majority people in their respective country (Constitución Española, 1978).

7. Conclusion

The European Union's focus on the regions has been current since the entry into force of the Single European Act of 1986, when European cohesion policy was first instituted in the EU's primary system. This policy is aimed at the territory (all regions and EU countries) in order to stimulate economic growth and improve the quality of life of the people there. Cohesion policy is based on a set of principles aimed at harmonious, balanced, effective and sustainable territorial development. It provides equal opportunities for citizens and businesses, regardless of their place of residence, for the best possible exploitation of their territorial potential. This policy reinforces the principle of solidarity in order to promote convergence between the economies of the better-developed territories and those whose development is lagging behind, emphasizing that development opportunities are best shaped in accordance with the specificities of the area. In this context, the regions represent the key institutions of European cohesion policy. In addition, regions have the opportunity to participate in EU policy-making. Therefore, the EU has become a framework for the balanced development of all its regions. The Treaty of Lisbon has further strengthened the position of regional self-government and regions in the EU political system.

European regions have an economic, legal and political impact on the system within nation states. Regarding the economic system, the regions are the backbone for the economic development of the modern state. The diversity of territories and identities of European regions represents a significant potential for regional development that contributes to the mobilization of their different potentials. In this context, regional interdependencies are becoming increasingly important, which requires cooperation, networking, and integration between different European regions. In doing so, territories with shared potentials or challenges can work together to find common solutions and use their territorial potentials through the exchange of experiences. Territories with different potentials can join forces, explore their comparative advantages, and jointly create additional development potential. In the political system, the regions are the basis for democracy and autonomy. The role of regions in the legal system is particularly evidenced by the fact that most EU legislation is implemented at local and regional level.

Comparison of the concept of constitutional position of regions in regional states (Spain and Italy) characterized by strong territorial autonomy of regions and broad legislative powers. Their emergence was a democratic response to the separatist aspirations of particular parts of these states whose proportions threatened their territorial integrity (in both cases after the collapse of authoritarian / totalitarian systems – in the case of Italy after the Second World War and in Spain after Franco). On this basis, they were accorded a special status of autonomy in relation to the central government, with broader competences than other regions.

The authors believe that organized regions with elected subnational governments are better solutions compared to statistical regions. They are better suited to use European funds effectively and to address development problems. Therefore, the authors propose the introduction of four or five such regions in Croatia. A smaller number of larger, personally and financially stronger regional units (rather than counties) are required in Croatia in order to conduct quality public affairs and promote socio-economic development. Such regional units would form the backbone of the regional development policy system in the future.

ENVIRONMENTAL LAW TECHNIQUES – EASTERN CROATIA VERSUS GLOBAL STANDARDS

ABSTRACT

Protection of nature and human environment is mentioned in the highest values of the Croatian constitutional order. Likewise, Article 70 of the Constitution of the Republic of Croatia prescribes the duty to respect nature and the human environment. The purpose of environmental protection is to establish minimum standards for an individual and / or society to exist permanently on Earth. For this purpose, it is necessary to build a quality legal system - from local, regional to national, or global level. Numerous studies, strategies, principles, measures have been developed in all legal systems to improve the level of environmental protection. The author believes that environmental techniques, that make up the operational part of legal principles, have not been sufficiently addressed. At European level there are, to a considerable extent, codified legal systems. However, the problem arises when crossing the borders of the European Union - the problem of world scale has become Amazonian fires that need to be remedied by appropriate measures: preventive, implementation, aid measures. Two hypotheses have been put forward: Member States are uniform in their measures and the reasons for the disaster are undefined rules, measures and legal protection. In order to confirm or refute the hypotheses, the following methods were used: comparative, normativistic, historical and inductive and deductive methods.

Key words: *environmental law techniques, legal protection, Amazon fires, EU, sustainable environment.*

1. Introduction

The title of the paper is symbolic. So far, the conference has been called the Economy of Eastern Croatia, therefore the title of the paper is *Slavonia versus Global Standards*. On the other hand, the Amazon rainforest was taken as an example because of its significant importance to the whole world. The paper will deal with European-Croatian documents versus international documents. Two theses are addressed: Member States are uniform in measures and causes of Amazonian fires are unequal rules. The paper is divided into four parts. After the Introduction, fhe following is the second part of the paper that defines the concept of sustainable development through meaningful documents. The importance of sustainable development for the individual and the social environment is addressed. The next subtitle refers to legal instruments for environmental protection. Legal instruments are a key element in maintaining sustainability. The last part deals with concluding considerations.

2. The importance of international sustainability

Third generation rights are a "newer content" rights- In the early 1970s, the right of the environment began to be debated. The term was first defined by Estonian scientist Jakob von Uexküll. Since then, cooperation has begun at national international levels in the field of environmental protection.

International environmental law is a branch of public international law with the aim of preserving the environment internationally. The goal is to control natural resources, to "sustain" sustainable development. „International environmental law covers topics such as biodiversity, climate change, ozone depletion, toxic and hazardous substances, desertification, marine resources, and the quality of air, land and water"[1]. The purpose of international agreements is to oblige states to use specific instruments to achieve the goal - the only objective in environmental law is sustainable development[2]. According to the Vienna Convention on the Law of Treaties, Article 26 lays down an obligation to comply with international agreements / treaties („Every treaty in force is binding upon the parties to it and must be performed by them in good faith"[3]). Other documents also recognized the importance of acting internationally. Eg. Article 21 The Stockholm Declaration is important because it prescribes a dual function: the right and responsibility of a Member State to act within its borders and to exploit natural resources and its responsibility towards other states - not to cause harm to other states. Awakening this awareness is the beginning of the signing of numerous agreements at the international level. The same principle is discussed in other conventions. In the Rio Declaration (1992), Principle 2 reiterated the content: it allows Member States to exploit natural resources while at the same time being obliged to take care not to harm other states.

Initially, international agreements focused on specific areas and later international agreements focused on the pursuit of sustainable development. The following table shows the development of international treaties in the field of environmental protection.

Table 1: The development of international treaties in the field of environmental protection

Rio Conference was crucial to understand the importance of sustainable development. Sustainability is a key concept in the environmental law system. In addition, its application is of a wider scale. According to Marco Zupi "It is difficult to relate it to just one scientific discipline that coalesces and structures knowledge about the world. It is an attractive term because it is complex, full of theory and political practice. It is an expression that is not easy to define. Moreover, it is insidious since it represents very serious problems and examines the traditional way of looking at the world and life in it."[4] Sustainability is often understood as eco-sustainability and "denotes the essential ability of any system to maintain unchanged its own characteristics and properties in a continuous relationship with space and time in which it is located".[5] The "original" expert definition can be considered to be the definition by the UN World Commission on Environment and Development[6] from 1987 in a document titled "Our Common Future": "development sustainable to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs".[7] Etymologically, the definition of sustainable development can be taken from Latin language *sustineo (sub-teneo)* in which it has a double meaning: "to hold up, sustain, endure" and "to take over, to convey and to commit oneself, to take on the obligation and the responsibility".[8] United Nations Conference on the Human Environment, the so-called Stockholm Conference, was the first conference convened for the purpose of international environmental protection. It was held in June 1972. Numerous environmental conferences have been held to date. The Convention on Biological Diversity was adopted in Rio in 1992. with the purpose of protecting biodiversity, the sustainable use of natural resources. A further step in protecting biodiversity is the 2000 Cartagena Protocol, whose purpose is to ensure handling, transport and use of modified organisms pursuant to the precautionary principle. The Second Protocol pursuant to Article 19 of the Convention on Biological Diversity is the Nagoya Protocol adopted in 2010.[9] The Johannesburg Declaration on Sustainable Development and the Implementation Plan were adopted in 2002. Also important to mention is the meeting of the UN Members organized in Rio de Janeiro in June 2012 named "Rio+20", and the outcome of this meeting was the document "The Future We Want", which, with the purpose of sustainable development, calls for mutual cooperation of three components: economic, social and environmental. The aim of the Paris Agreement is to preserve the current situation from possible climate change. In other words, increase the capacity to adapt to negative climate change.

3. Legal instruments of environmental protection

"Environmental techniques are environmental measures that are prescribed in the process of establishing an environmental permit through the determination of the best available techniques

for a plant, and include technology and how technology is planned, built, maintained, used and disposed of."[10]

According to the authors, there are two types of instruments in environmental policy: command - control and economic instruments. In doing so, command and control instruments include the monitoring of emissions by non-marketable quotas and technical standards, while all others constitute a group of economic (market) instruments.[11] According to author Elli Louka, most international instruments are a command-and-control approach. They are mostly based on the international exchange of information and the submission of reports.[12]

Above all, the Constitution should be singled out as the foundation of every state. Article 3 of the Constitution of the Republic of Croatia prescribes environmental protection as a fundamental value. Article 70 stipulates that the state ensures a healthy environment. Also, self-government units take care of the environment. The next document in importance is the Environmental Protection Act[13]. The Environmental Protection Act contains the following facts: objectives, principles of environmental protection, environmental protection entities, documents of sustainable development and environmental protection, environmental instruments, environmental monitoring, environmental information system, public participation and access to justice in environmental matters, liability for damages, environmental financing, misdemeanour provisions and oversight of the environmental protection system. At the national level, there is also Environmental Protection Plan of the Republic of Croatia until 2020 (hereinafter: Plan)[14], Sustainable Development Strategy of the Republic of Croatia[15] and the Environmental Protection Intervention Plan[16]. The Plan prescribes environmental instruments that seek to eliminate pollution at source. The Strategic Environmental Impact Assessment, the Environmental Impact Assessment and the Environmental Permit were specifically highlighted. Also, separate information was provided - local and regional self-government units have a special role in environmental protection, but self-government units have not fully fulfilled their role. They have not fulfilled their role because they are not independent in performing their tasks in the field of environmental protection and frequent contacts with the competent Ministry.

In practice, there are various techniques aimed at furthering the objectives and applying the basic principles of environmental rights. The purpose of preventive measures is to either avoid or reduce or eliminate the risk of harm. Preventive measures include regulation, licenses and environmental impact assessment. There are four types of standards within regulations: quality standards, emission standards, process standards and product standards. Quality standards define the maximum permissible pollution in an area and depend on geographical features. Emission standards mean a certain amount or concentration of pollution that can be emitted from a source. Process standards require a specific production method, and product standards define the physical or chemical composition of an object, the handling of the object, and the level of pollution that the product can emit during its use. In certain situations, certain rules may be imposed if an action, product or process poses a risk of environmental damage. Licensing, as the second element of regulation, is the most widely used technique for pollution prevention. Most legal systems have provided lists of licensed actions. As a third component,

an environmental impact assessment appears, in which the applicant submits a written document defining the environmental impact of the action. Therefore, the assessment must include a description of the proposed action, a description of the potentially threatened environment, a description of practical alternative actions, an assessment of possible environmental impacts, mitigation measures, indications of potential uncertainties that may be encountered. Implementation measures are oversight, reporting and control (monitoring). Supervision consists of collecting data and submitting it to an institution to analyze it. Control or monitoring is the continuous collection of information and their constant comparison with the relevant parameters. Despite all the instruments available, pollution is still occurring. To this end, there are assistance and coercive measures: the nature of liability, the scope of liability, coercive measures. The principle of liability is based on the fact that the damage has occurred, but it is imposed on the owner of the shop. The problem is with the level of responsibility, as it is mostly about the so-called "soft law." The problem, as always, is profit because states do not want to take responsibility at the expense of profitability.

According to the Environmental Protection Act[17], the following environmental protection instruments are envisaged in the Republic of Croatia: environmental quality standards and technical environmental standards; strategic assessment of the environmental impact of the strategy, plan and program; environmental impact assessment; environmental permit; prevention of major accidents involving dangerous substances; spatial plans as environmental instruments; transboundary environmental impact of strategy, plan and program, intervention and plant; environmental measures for activities for which no environmental impact assessment obligation is prescribed. Quality standards contain limit values, but areas that are more sensitive are defined by law and others can be defined by a Government decree or ministerial regulation. The strategic environmental impact assessment foresees significant environmental impacts that may result from the implementation of a strategy, plan or program. Strategic evaluation is carried out during the drafting of the strategy, plan and program proposals. During the strategic assessment, a strategic study is conducted to assess the expected environmental impacts that the implementation of the strategy, plan and program may cause. An environmental impact assessment is an assessment of the possible significant environmental impacts of the intervention, based on their nature, size or location. Ultimately, the purpose and purpose of the environmental permit is to obtain "comprehensive environmental protection through integrated pollution prevention and control, ensuring a high level of environmental protection and conditions to prevent significant environmental pollution from industrial activities."[18] Preventing major accidents involving hazardous substances is also one of the environmental instruments. Spatial plans as an environmental instrument emphasize the distance between plants and residential areas, public places and ecologically significant areas. If the implementation of a strategy, plan or program could affect the environment and / or health of the people of another country, it shall inform the competent authority of the other country of the draft proposal, plan or program. If an environmental impact assessment obligation is not prescribed and the contractual obligations established by international treaties or agreements or by special regulations are required, then an environmental study must be prepared. Environmental monitoring is the systematic monitoring of environmental quality, changes in the environment and its components. For the purpose of better implementation and implementation of environmental measures, it is possible to develop an operational environmental monitoring program at the request of the operator. In addition, it is also possible to set up reference centres for environmental monitoring. The parent law has overlooked expropriation or restrictions on real rights if there is an interest by the state in setting up facilities or measuring devices for environmental monitoring purposes.

In the Treaty on the Functioning of the European Union, the European Union, in Articles 191 to 193, addresses the following objectives: to ensure the protection of human health, the protection of the human environment and international cooperation in order to achieve the above objectives.[19] Environmental policy is based on the precautionary principle and the precautionary principle. Furthermore, the principle that the polluter pays because the damage is repaired at the source is also crucial. The measures envisaged to achieve the aforementioned objectives are: the European Parliament and the Council, acting in accordance with the ordinary legislative procedure, shall decide on the achievement of the above objectives; in addition, a special legislative procedure is also underway to achieve the set objectives. Adopts the following measures in accordance with the above procedures: provisions of a fiscal nature; measures relating to spatial planning; quantitative management of water resources; land use and waste management; measures concerning the use of energy sources.[20] Member States may also introduce more stringent safeguards. Under Directive 2004/35 / EC of the European Parliament and of the Council of April 21, 2004 on environmental liability with regard to the prevention and remedying of environmental damage, precautionary measures are prescribed if the damage has not yet occurred, but there is an imminent danger. In such situations, the operator[21] is obliged to inform the competent authority of the current situation and the competent authority may at any time request the following:

1. Provision of information in case of imminent threat of environmental damage
2. Taking preventative measures
3. Instruct the operator on all necessary measures
4. Implement the necessary measures by own action.[22]

However, if damage has occurred, the operator shall inform the competent authority and take the following steps: putting all pollutants under control so as not to further affect human health and the environment. In addition, the competent authority may request the operator to provide additional information and to put in place additional remedial measures. Aware of the weight of environmental responsibility for present and future generations, in 2001 they set minimum standards for environmental inspections. Although the Standards are optional, the primary starting point for adoption is the control over the implementation of national legislation. An environmentally friendly solution is to strengthen the enforcement of national legislation. Minimum standards can only seemingly satisfy the need for reasons they are optional. Some minimum standards in the area of inspection are the following: to plan in advance how inspection is conducted; make a register of controlled installations; a general assessment of major environmental issues; store inspection results, etc.

The Stockholm Convention and the Treaty of Paris have been singled out internationally. The Stockholm Conference adopted certain recommendations in an Action Plan that enables international action:

1. Environmental Assessment (evaluation and review, research, monitoring, information exchange);

---

[19] Treaty on the Functioning of the European Union (2016/C 202/01), Article 191

[20] If any of these measures entails high costs for the public authority of each Member State, then temporary derogation and / or funding from the Cohesion Fund is possible.

[21] According to Directive 2004/35 / EC of the European Parliament and of the Council of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage, L 143/56 Article 2 (6) "Operator" means any natural or legal, private or public person who operates or controls the occupational activity or, where this is provided for in national legislation, to whom decisive economic power over the technical functioning of such an activity has been delegated, including the holder of a permit or authorisation for such an activity or the person registering or notifying such an activity.

[22] Directive 2004/35 / EC of the European Parliament and of the Council of 21 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage, L 143/56, Article 5

2. Environmental Management (goal setting and planning, international consultation and agreements);

3. Supporting measures (education and training, public information, organization, financing, technical co-operation).

All 155 recommendations are categorized in the Action Plan by area: the global environmental assessment programme (Earthwatch), the environmental management activities and the supporting measures.

The instruments available under the Paris Agreement are:

(a) „Early warning systems;

(b) Emergency preparedness;

(c) Slow onset events;

(d) Events that may involve irreversible and permanent loss and damage;

(e) Comprehensive risk assessment and management;

(f) Risk insurance facilities, climate risk pooling and other insurance solutions;

(g) Non-economic losses; and

(h) Resilience of communities, livelihoods and ecosystems."[23]

According to the Constitution of the Federal Republic of Brazil, the environmental chapter provides for certain measures:

 - Preserve and restore ecological processes and ensure ecological treatment of species;

- Preserve biodiversity and monitor the effects of genetic engineering;

- Organize territorial units and ensure their protection;

- Make an environmental impact assessment where there is a potential risk of danger;

- Control the production, sale and use of techniques that can pose environmental risks;

- Conduct environmental education;

- Protect the flora and fauna in the manner prescribed by law.[24]

The Amazon rainforest, the so-called the lungs of the world deservedly got a new name. According to experts, there are a number of reasons for the importance of the whole world: conservation is essential for agricultural production and conservation of the so-called. "Flying rivers." The term refers to water vapour generated by evaporation, and the whole process affects the amount of precipitation in South America. The Amazon rainforest is also affecting climate change, as tropical forests are generally thought to absorb 90 billion to 140 billion tons of carbon, all of which affect the stability of the world's climate. The start of international codification can be seen as the 1992 United Nations Convention on Climate Change and the 1997 Koyoto Protocol focusing on greenhouse gas emissions. The continuation of the Protocol is the 2011 Paris Agreement. Brazil is among ten countries with huge greenhouse gas emissions. In line with the above, Brazil is committed to reducing its greenhouse gas emissions by 43% by 2030. The stated goal can only be achieved by additional afforestation, which is prescribed for 12 million hectares of land. Due to its rich flora and fauna, the Amazon rainforest has the highest biodiversity in the world, which is also essential for maintaining homeostasis worldwide.[25]

4. Concluding thoughts

The first hypothesis can be regarded as proven, ie there is a uniformity of legal rules at European Union level. First of all, this is evident from the main law, the Environmental Protection Act[26], which in its provisions contains a variety of environmental instruments, but also sanctions in case of non-compliance. The Environmental Protection Act is fully in line with European legal regulations. During its accession to the European Union, the Republic of Croatia underwent the harmonization process.

The second thesis set out in the abstract has not been confirmed - there is no uniformity of legal regulations at the global level. It is believed to exist because the signing of international documents (though not obligatory) entails some forms of responsibility. States Parties are morally bound (by the international community, by the environment) to apply international agreements. The Stockholm Conference, with its environmental assessments, environmental management and incentive measures, is cited as an example. Also mentioned is the Paris Agreement, which includes risk assessment, risk management, the precautionary principle. There are no mandatory standards in international agreements. States Parties are required to submit reports, but there are no sanctions. Legal instruments in the field of environmental protection are in the area of "soft law". However, the importance of the environment goes beyond the elements of "soft law". The importance of environmental protection should be placed on the obligatory, legal and imperative basis by states. The United Nations Conference on the Human Environment in Stockholm is based on recommendations. Also, the Convention on Biological Diversity, Cartagena Protocol, Nagoya Protocol, United Nations Conference on Sustainable Development in Rio de Janeiro RIO + 20 do not have a sanction system in place. There is no relationship between the commanding and sanctioning norms. The issue that remains at the national level is the implementation of measures in the country and supervision or sanctioning in the signatory state. In addition to the cause-and-effect relationship between the norm and the sanction, an effective state is needed. An efficient state implies effective institutions, implies political, economic and administrative efficiency in the state. Therefore, the measures are identical in Slavonia and the Amazon, it is only a matter of implementation, control and control in the countries. The Constitution of the Federal Republic Brazil also has environmental instruments: the conservation of ecological species, the control of genetic engineering, the control, sale and use of techniques that can pose a threat to the environment, etc.[27]

The international community should respond more rigorously in certain situations. The first recommendation would be to control trade relations between countries that do not respect the obligations of international environmental agreements. This would make compliance with the obligations assumed in the field of "soft law". Although the application of the principle of subsidiarity is emphasized today, it may be necessary at some point to pursue other measures for the purpose of 'good governance'. Other measures contrary to the principle of subsidiarity - more frequent supervision and sanctioning by the international community. Key situations bring with them key reactions. Sometimes measures contrary to the principle of subsidiarity may have their justification. In addition, the principle of subsidiarity means that if states are incapable of solving the problem, then the action of a supranational organization is justified. This would be the true meaning of the principle of subsidiarity - if the States Parties did not properly implement the measures taken by international agreements, the focus should be shifted to a supranational level. In such a situation we can expect sustainable development - cohesion of economy, efficiency and democracy. In this situation, there would be no difference between

Slavonia and the Amazon because the international community would have obligatory instruments in the international environmental policy.

HISTORICAL REGION AS A BASE FOR BRANDING A DESTINATION – THE CASE STUDY OF THE REPUBLIC OF POLJICA

ABSTRACT

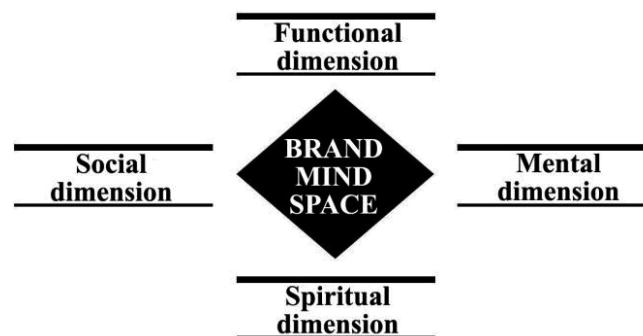
The subject of this paper is the Croatian historical region of the Republic of Poljica and an assumption that the historical aspects of this region could be the base and solution for destination branding. Poljica is an area with specific geographical, cultural, natural and historical characteristics. This region is currently administratively divided between seven local government units. The main objective of this paper is to explore the attitudes of people living and related to Poljica through questionnaires and to explore the main local government units which are in charge of this region through in-depth interviews. The goal is to discover the available resources of Poljica and the significance of Poljica as a historical region. The results of the research showed that both groups of respondents are considering Poljica as a cultural-historical region and should be officially proclaimed as such. This would lay the groundwork for building a unique Poljica product and brand which would be the Republic of Poljica. In addition, this way of destination branding could be the solution for other Croatian cultural-historical regions experiencing the same issues. The results show dissatisfaction of the respondents with the tourist offer of the area itself, as well as the way local authorities manage the area. However, according to the research results, there is an interest of people who live in Poljica in participating in activities aimed at developing and promoting the Poljica region. The results show that in developing Poljica as a tourist destination, it is necessary to establish a collaboration between all local self-government units and to establish a tourist board for the territory of several municipalities and cities in accordance with the spatial, cultural and other characteristics of a particular area, regardless of administrative boundaries.

Key words: *destination management and branding, cultural-historical region, local government units and tourist boards, Republic of Poljica – Croatia.*

1. Introduction

Tourist destination is defined as an organised spatial unit recognised on the tourist market which provides a range of tourism-related products perceived by the consumers as capable of meeting their leisure-related needs (Križman Pavlović, 2008). Destination brand may be

defined as a name, symbol, logo or mark that both identifies and differentiates the destination, which serves to consolidate and reinforce the recollection of pleasurable memories of the destination experience (Blain, Levy and Ritchie, 2005). Region is defined as an area with common specific characteristics, which may be natural, economic, physiognomic and social (Bjelajac, 2010). The term *historical region* implies a common historical experience characterised by longevity, with common historical features of the region being more important than their differences (Delanty, 2012). In the era of globalisation, when all available information is only a click away, the creation of brand recognition is the cornerstone of competition. Since the market is rapidly changing, people do not have time to learn about the authenticity of each destination, so they tend to believe in the stereotypes such as that Paris and Milan are the capitals of style. All those clichés and stereotypes, regardless of their authenticity, affect the total number of visitors of a certain destination (Anholt, 2007). The process of globalisation has increased the need of destinations to become market-oriented, i.e. to compete globally, and not only regionally. The cities have designed various ways to attract more visitors, investors, fairs, tourists and events (Jelinčić, 2017). In the world of business, distinctiveness is crucial. Not being different means to be replaceable. The difference is not merely in the product itself, but also in the way the product is presented or delivered. The brand development strategy is divided into four categories or dimensions in the minds of the consumers: *functional dimension* (brand-related benefits of the product or services); *social dimension* (possibility of identification with the group); *spiritual dimension* (perception of local or global responsibility); *mental dimension* (possibility of providing mental support to the individual) (Gad, 2005).

Figure 1: Brand Mind Space


Source: adapted by: Gad, T. (2005): 4-D Branding, Breaking the Network Economy Corporate Code

The concept of sustainable development implies such development which meets the current needs but at the same time does not reduce the possibility of meeting the needs of future generations. The potential benefits of the concept of sustainable tourism include a quality product offer, the preservation of the resource base, the strengthening of cultural identity of the domicile population, and a greater public understanding of the tourism industry (Križman Pavlović, 2008). This paper focusses on the historical region of the Republic of Poljica situated in the Central Dalmatia, whose origin dates back to the 13th century. This region was administratively and socially advanced. It ceased to exist in 1807 after the Napoleon`s army occupied the area. Considering the fact that the Poljica area is currently divided among several local self-government units, the branding of Poljica as a unique region would require the consolidation of all stakeholders and all local self-government units. Poljica as a separate region contains many natural and cultural-historical resources which may serve as the foundation for a sustainable development of the region. The branding of Poljica as a region implies the merger of all attractions, products and services under a unique concept of "umbrella

branding", i.e. the use of a single brand name for the sale of several different products and/or services (Fry, 1967).

The first group of ***population-oriented aims of the research*** derives from the above: to determine the significance of Poljica as a historical region; to examine whether the definition and perception of Poljica as a historical region may contribute to the tourist development of the destination; to examine the satisfaction of respondents with the tourist offer of Poljica and the attitudes of the local population towards the local self-government units. The paper implies that the ***local self-government units and their tourist boards*** within the Poljica area should merge and collaborate in order to brand Poljica as a tourist destination with market recognition and competitive offer with respect to other destinations. The second group of aims is defined within this context: to examine the attitudes and opinions of crucial stakeholders (tourist boards and local self-government units) about their mutual collaboration; to determine whether the collaboration is possible, and whether the collaboration of crucial stakeholders with respect to perceiving Poljica and the former Republic of Poljica as a unique functional unit and a contemporary historical region could lead to the development of the area as a quality tourist destination; to explore the possibility of local self-government units in order to design a common strategy of tourism development of the Poljica area which will serve as a guideline and foundation for further activities; to determine whether it is possible to establish a destination management organisation in the Poljica area; to examine the opinion of tourist boards about the attitudes of the local population towards their activities; to examine the previous strategies and the future plans; to determine whether there is a need to introduce additional activities and amenities in the tourist offer. This paper contributes to the existing literature in the field of tourist destination development and branding. It may serve as a foundation for the tourist and economic development of the region in question, and help in the development of the same or similar historical regions.

2. Tourist destination

Tourist destination, in the simplest form, is a special geographical area visited by tourists who gain special tourist experiences by travelling across the area and visiting its various sites. The offer in a modern destination should be integrated and include all necessary amenities for the pleasant experience of the tourists (Bosna and Krajnović, 2015). In tourism, a destination refers to the location, place, region, country and a group of countries as a travel destination. A tourist destination represents a flexible and dynamic space whose boundaries are determined by the tourist demand, regardless of its administrative boundaries (Petrić, 2006). In order for a location to become a popular tourist destination, it must contain natural attractions, such as, for instance, exotic landscape, climate, beaches and pleasant environment, and have implemented decisions on the development of the infrastructure and tourist facilities, ensure investments, hire and train tourist personnel and select the best method to promote the tourist attractions of the location so that its special features are presented to the potential visitors in the most appropriate manner (Alkier Radnić, 2003). The main goal of any destination is to achieve a long-term competitive advantage at the tourist market (Gračan and Rudančić, 2013). Therefore, a tourist attraction (Magaš, Vodeb and Zadel, 2018) requires the spatial integrity of the tourist offer; it contains a sufficient number of offered elements; it is market-oriented and tourist-oriented; it is independent of administrative boundaries; it must be managed. The strategic goals of the tourist destination marketing are as follows (Buhalis, 2000): to ensure a long-term progress for the local population; to maximise the satisfaction of visitors; to maximise the multiplicative effects and the profitability of local entrepreneurs; to optimise the effects of tourism by ensuring a sustainable balance between the economic benefits and the socio-cultural

and environmentalist expenses. *Destination management* is a continuous process where the tourism industry, the government, the local self-government units and other operators govern the development of the destination with the aim to achieve a common goal and vision. The participation and collaboration of the local community, relevant government authorities and industrial stakeholders is indispensable for the achievement of all planned agreements and goals (Ruhanen, 2007). Quality destination management requires an efficient management of destination resources and the acknowledgement of community interests (Rudančić, 2018). In Croatia, the active participants in the destination management are the public sector (system of tourist boards, local government and self-government units), the private sector (business operators) and the local population of the tourist locations. The complexity of destination management derives from the dire need to ensure sustainable development through the optimal use of resources. It aims to achieve competitiveness in the rapidly changing socio-economic environment (Laesser and Baritelli, 2013). World Tourism Organization (WTO) defines *destination management organisations* as those in charge of the destination management and/or marketing (WTO, 2007). Destination management organisations (DMOs) not only attempt to manage and coordinate stakeholder behaviour at destinations, but they also act as opinion leaders and valuable sources of intelligence for the destination. The present-day role of the DMOs surpasses the mere knowledge of destination management and includes the broader knowledge of economy and socio-environmental effects on the destination system (Bandari, Cooper, Ruhanen, 2014). Important stakeholders in destination management include: local population, public sector government – local and regional self-government units; organisations in charge of tourist management and development (tourist boards, tourist associations, tourist and event organisations and similar entities) (Tomljenović, Živoder and Marušić, 2013). The local self-government plays one of the most important roles in the development planning strategies of tourism and tourist products in a certain area (Dredge and Moore, 1992). The local self-government units are faced with a wide range of challenges connected with a more efficient tourism management within a destination. The greatest challenge is the integration of tourism management with other functions and activities of the local self-government (Chili and Xulu, 2015).

3. Destination branding

Brand is a combination of different factors attributing a certain distinctive identity to the product and/or service (Paliaga, 2007). In addition to products and services, destinations may also be branded. Countries, cities and regions can be branded, too. Tourism is perceived as an activity which terminated the isolation of countries and cities by stimulating large investments of funds in the differentiation of locations with respect to competitive destinations (Gomez, Fernandez, Molina, Aranda, 2016). Branding in tourism is a procedure which distinguishes a certain destination by its characteristics and comparative advantages, thereby creating the destination identity (Bolfek, Jakičić, Lončarić, 2013). Destination image results from the tourist perception and is often not aligned with the desires of the tourism stakeholders and the local population (Šerić, 2012). Tourist destinations as brands should guarantee a certain level of quality and safety, ensure a framework for a positive relationship between the tourist destination and the end users, and define the consumer niche of the end user (tourist) (Krajnović, Bosna, Jašić, 2012). The development of the tourist brand of a certain area requires the collaboration of a wide spectrum of organisations and individuals in the public and the private sector, and activism within the framework of official channels (Warren, Dinnie, 2017). Neglecting the importance of the destination brand and positive image may have negative repercussions on competitiveness (Kesić, Pavlić, 2011). The challenge of destination branding lies in the complexity of the tourists` decision-making process (Liping, 2002). In the process

of destination selection, in the event of comparable prices, a potential tourist`s perception of the destination is the decisive factor in the selection of the vacation location (Pavlić, Kesić, Jakeljić, 2012) A larger product portfolio with a well-established umbrella brand helps the organisation to strengthen the brand position and to increase the marketing efficiency (Perić, Čuić Tanković, Urkin, 2016). From the marketing standpoint, region is perceived as the umbrella brand including a set of various, contrasting and complementary types of services which can provide a wide range of services to the customers. Region is the key functional and geographical unit which requires the branding and the development of marketing and developmental activities. Marketing in tourism is represented as a sum of individual marketing activities of different market participants (Meler, 1998). Even though it has certain similarities with the product branding, destination branding is considerably more complex. It is necessary to achieve an agreement of all interest groups acting in the territory of the region with the aim to determine the vision, objectives and the image of the destination (Pike, 2005). It should be noted that the destination identity includes geographical features, culture, history, tradition, customs, lifestyle and architectural character (Ochkovskaya, Gerasimenko, 2017).

4. Republic of Poljica (Poljica Principality)

Poljica, a landscape of exceptional natural beauty, spiritual and cultural-historical heritage, is situated in the Croatian region of Dalmatia, and geographically delineated by the river of Cetina in the east, the river of Žrnovnica in the west, the Adriatic Sea in the south and the slopes of the Mosor hill in the north. Due to drastic relief changes and climatic specificities covering the surface area of 250 km2, the territory of Poljica is divided into Gornja (Upper/Zagorska), Srednja (Middle/Završka) and Donja (Lower/Primorska) Poljica. As a result of favourable micro-climatic and other natural conditions, Poljica has always been recognised as the area of exceptional appeal in terms of living and housing. This is confirmed by numerous archaeological sites rich in artefacts which are scattered across the mountain heights of Poljica, fertile valleys and the several thousands of years old toponyms which are still used (Kuvačić - Ižepa, 2002).

After the indigenous peoples of unknown etymology, and later the ancient Ilyrian tribes of Dalmatae, Onestinum, Narensi, Pituntium and others, inhabited the territory of Poljica, the Greeks, and later the Romans occupied the area, as evident from the numerous traces of their dwellings and burial sites, ritual piles and megalithic structures, ceramics sites, jewellery, tools and weapons, as well as ancient monuments and countryside villas which, despite their decrepit appearance, still adorn the landscape of Poljica. It is believed that the Roman Emperor Diocletian had a fish pond in the Lišnjak (Srinjine) area in Srednja Poljica, whereas Lucius Artorius Castus, the commander of the Roman legions and the prefect of the Roman fleet who associated with the origin of the historical legend about King Arthur, likely built an impressive estate and the burial plot in the littoral part of Poljica (St.Martin, Podstrana). Poljica abounds with tangible and intangible proof about the early arrival of Slavs, and later Croats, onto this territory. While many toponyms such as Perun, Perunsko, Perunić, Mošnica, Zmijski kamen and other sites situated in the west part of Poljica are audible testimonies of the names of Proto-Slavic deities, the early emergence of Christianity is confirmed by the remains of the grand basilica dating back to the 6th century near the church of St. Cyprian in Gata, and particularly by the pre-Romanesque church of St. Peter on Priko and the Benedictine monastery of St. Peter dating back to the 11th century in Selo (Sumpetar). This place is home to the Sumpetar Cartulary, one of the oldest and most significant preserved written sources of the history of Poljica and Croatia. However, Poljica is undoubtedly renowned as a multi-centennial Old Croatian principality which was, unlike the patrician Dubrovnik Principality, the land of free

peasants referred to as *didići* (who had rights on lands), who descended from the three sons of Miroslav, the assassinated King of Croatia ruling from 945 to 949. According to the oral tradition, they inhabited Poljica at the beginning of the 11th century. After 1357, they were joined in their endeavours to build a harmonious and fair society by the descendants of the noblemen Juraj Rajčić and Dražoje (*ugričići* (noblemen from the areas controlled by Hungary) or *vlasteličići* (noblemen from other parts of the Kingdom of Croatia-Hungary)), who were referred to Poljica by Louis, the King of Croatia and Hungary. The self-government of the people of Poljica lasted for six centuries. Its internal structure was based on the separation of powers into three branches: legislative power was under the competence of the National Assembly or College, whereas the executive and judicial power was performed by the Poljica Table led by the great prince who was elected by 12 princes or village elders from 12 villages of Poljica each year on St. George`s Day [the traditional Poljica villages and associated villages of Gornja Poljica include: Dolac Donji and Gornje Polje (Putišići, Srijani, Trnbusi); of Srednja Poljica: Kostanje (Podgrađe, Seoca, Smolonje), Trviž-Zvečanje, Čišla (Ostrvica), Gata (Zakučac, Naklice), Dubrava (Zastinje, Račnik), Sitno and Srinjine (Osič, Čažin Dolac, Ume); of Donja Poljica: Duće (Truše), Jesenice and Podstrana]. The most important political and cultural achievement of the ancient Republic of Poljica is the famous Poljica Statute written in Bosnian Cyrillic script in Croatian language (in Shtokavian and, in places, Chakavian dialect), whose oldest manuscript conserved in the archives of the Croatian Arts and Sciences Academy in Zagreb dates back to 1440. This common law code is one of the oldest and the most significant Croatian historical and legal documents because it testifies to the particularity of spiritual and social environment of this small rural republic and its democratic achievements which had preserved the faith of its people in the strength of their community for a long time. Even though Poljica established a higher education institution for Glagolitic priests who cared for the spiritual life of the community and literacy of the people as early as in 1750 on Priko, the historical conditions urged them to defend the right to their own way of life in blood. Therefore, the oral tradition still preserves the vivid memory of Mila Gojsalić, the brave heroine of Poljica from the era of the battle against the Ottomans, who personified the heroism of Poljica and the sacrifice for the Poljica sovereignty, hence her character inspired some of the greatest Croatian artists such as Meštrović, Gotovca, Šenoa, Papandopulo, Rački, Ivanišević and others. In the same period, Žarko Dražojević, the prince of Poljica, rose to fame. Since he was considered a hero, the City of Split honoured him by laying him to rest in the Cathedral of St. Domnius in 1508 as the first secular nobleman because he, like many other people from Poljica before and after him, sacrificed his own life to defend Split and Klis from the Ottomans. The heroism exhibited in the battles against the Ottomans raised many other people from Poljica to immortality, such as Bara Lekšić and Mara Žuljević, the priest Jure Pezelj, brothers Janko and Šimun Marjanović, Juraj Roguljić who was the first to raise the flag of freedom at the fortress Kamičak in Sinj in 1686 and Marko Sinovčić, who was crowned with glory in the Cretan War (1645-1699), which earned him the honour of the governor of the capital of Crete. Famous people originating from Poljica in the recent period include the noble historiographer Alfons Pavić Pfauenthal (1839-1919), ethnographer and priest Frane Ivanišević (1863-1947), saint and Presbyterian Leopold Bogdan Mandić (1866-1942), composer Ivo Tijardović (1895-1976), writers Vladimir Nazor (1876-1949), Drago Ivanišević (1907-1981), Jure Kaštelan (1919-1990), Nikola Miličević (1922-1999) and Josip Pupačić (1928-1971). The particularity of the Poljica identity made a lasting impression on many people beyond the borders of Poljica, including the Russian scientist Mihail Pavlovič Alekseev (1896-1971) who wrote about the Slavic (Poljica) sources of Utopia (Louvain, 1516) by Thomas More. In addition, Thomas More (1478-1535) referred to the Glagolitic priests from Poljica as Poly(it)eritu, i.e. those who simultaneously use several scripts (Glagolitic, Cyrillic and Latin). Finally, even the Napoleon`s Marshall Marmont, who was so impressed with Poljica (even

though it was the French who eventually terminated the particularity of Poljica by the military decree of the general governor Vicenzo Dandolo on 11 June 1807), wrote the following in his memoirs: "Everything in this place speaks in its favour, its external appearance and the internal structure of its governance. I have not seen anything more precise and diligent than their land cultivation, anything more decent than their villages and anything more just than their regulations". On 3 January 1912, upon the approval of Vienna, Poljica was reinstated as a unique municipality with the seat on Priko. It existed within its historical boundaries until the WWII, after which it was again divided among the adjacent cities of Omiš, Split and Sinj. In the modern-day Croatia since 1992, the historical area of Poljica has been claimed by the cities of Omiš, Split and Trilj, and the newly-founded municipalities of Dugi Rat, Podstrana, Dugopolje and Šestanovac (Figure 3). Therefore, it should be noted that the territorial integrity of Poljica is still only preserved by the Poljica Deanery founded on 21 September 1957 as a territorial and pastoral entity included in the Split-Dalmatia Archdiocese which contains 19 parishes: Donji Dolac, Dubrava, Duće, Dugi Rat, Gata, Jesenice, Kostanje, Ostrvica, Podgrađe, Podstrana, Priko-Omiš, Donje Sitno, Gornje Sitno, Srijane-Gornji Dolac, Srinjine, Strožanac-Podstrana, Trnbusi, Tugare and Zvečanje (Mekinić, 2011, Pivčević, 1987). Even though it does not exist as a formal and legal entity for decades, Poljica is still very much alive in the hearts of the people of Poljica of all ages, both of those originating from the territory of the ancient principality and those who moved to different Croatian and worldwide territories. Since the cultural-historical and traditional heritage of Poljica and the beauty of its landscape still attracts new inhabitants and numerous tourists, it seems that Poljica remains *terra incognita* only in the eyes of its competent cities and municipalities and their tourist boards, which is an issue to be explored in this paper.

5. Research results

The *first part* of the primary research in this paper was performed by a descriptive analysis based on a structured questionnaire on the sample of 290 respondents. One of the most important control research variables of the sample was to include respondents originating from Poljica and those not originating from Poljica, and the residents (living temporally in Poljica) and non-residents of Poljica. Respondents were able to complete the survey online (the respondents were selected so that the survey was published on social networks in groups affiliated with Poljica) or in print by going to the Poljica area and distributing the survey to the residents.

The *second part* of the primary data collection included the examination of the competent local self-government units (municipalities and cities) and the competent tourist boards in the area of the Republic of Poljica. The research was conducted via in-depth interviews with the competent officials and the analysis of the secondary data (tourism development strategy of certain cities/municipalities in the area of the Republic of Poljica).

The results of the ***first part*** of primary ***population analysis*** show approximately the same number of male (51.8%) and female (48.2%) respondents. The largest number of respondents are aged between 35 and 45 (25.7%), or between 24 and 28 (21.2%). According to the level of education, the largest number of respondents have attained a secondary education level (48.7%) or a university degree (26.1%). The largest number of respondents have a permanent or a part-time employment. The largest number of respondents have a total household income of 7,001-10,000 HRK (21.2%), or 10,001-15,000 HRK (20.4%).

Graph 1: Parentage of respondents (%)
Source: created by the authors based on the research

According to the research results, the majority of respondents originate from Poljica, as evident from the graph above. In addition, a large number of respondents own a house (47.8%) or a land property (40.7%). Out of all the respondents who own any kind of material property in the Poljica area, the largest number of respondents own both a house and a land property. The total of 23% respondents are actively engaged in an association affiliated with Poljica. The total of 39.4% respondents reside in the Poljica area. The largest number of respondents residing outside of the Poljica area live in Split. However, some respondents stated that they did not live in the Poljica area, whereas they listed the locations within the Poljica area as their places of residence. These results showed that there are respondents who are unaware of the fact that they live at the territory of the former Republic of Poljica.

In the follow-up survey, the respondents were able to list their first association with Poljica through an *open-ended question*, so they most frequently listed *soparnik* (baked pastry filled with Swiss chard) (24.8%). Other frequently listed associations include the Poljica Statute (8.4%) and Cetina (7.5%). The rest of the associations had below 5% of occurrences. The replies of the respondents originating from Poljica were compared to the replies of those not originating from Poljica. In both cases, *soparnik* was the most frequently listed association, even though it was less mentioned by the respondents originating from Poljica (19.5%) as compared to those not originating from Poljica (42.3%).

By conducting further research and providing the respondents with various associations related to Poljica (Table 1), it shows that the respondents expressed the strongest association

with Poljica through *soparnik*, the Poljica Statute, the Republic of Poljica (the Poljica Principality), Mila Gojsalić, Mosor, Cetina and Gradac with the church of St. George, which is a valuable input for the future branding of the Republic of Poljica. The least recognised association with Poljica was Lvcivs Artorivs Castvs (the mythical King Arthur) because 25.3% of respondents stated that there are no associations between him and Poljica at all, while 29.1% stated that there are no associations between him and Poljica. Less recognised association, and one of the most important Poljica resources, is the Šćadin rainforest, as 27.4% of respondents stated that there are no associations between the rainforest and Poljica, while 17.3% stated that there are no associations between the rainforest and Poljica at all. Less recognised associations also include the church of St. Peter on Priko, as 41.1% of respondents stated that they there are no associations between the church and Poljica.

Table 1: Associations with Poljica

Association	There are no associations at all	There are no associations	There are some associations	There are associations	There are many associations
Soparnik (baked pastry filled with Swiss chard)	0.4%	1.8%	10.6%	15.5%	71.7%
Republic of Poljica (Poljica Principality)	2.2%	3.1%	11.1%	18.1%	65.5%
Mila Gojsalić	2.7%	2.2%	12.8%	18.6%	63.7%
The Poljica Statute	0.9%	3.1%	11.5%	21.7%	62.4%
Mosor	2.2%	3.1%	19.5%	20.4%	54.9%
Cetina	2.2%	4.4%	19.0%	28.3%	46.0%
Gradac with the church of St. George	6.2%	12.4%	18.6%	21.2%	41.6%
Small fields delineated by dry-stone walls	3.1%	10.2%	23.9%	26.5%	36.3%
The Historical Museum of Poljica	4.4%	10.6%	25.7%	24.3%	35.0%
Glagolitic and Bosnian Cyrillic script (Poljica script)	5.3%	13.7%	23.9%	25.2%	31.9%
Sanctuary of St. Bogdan L. Mandić in Zakučac	10.2%	14.2%	27.0%	21.2%	27.4%
Sea	8.4%	15.5%	29.6%	20.4%	26.1%
Historical seal	5.8%	22.1%	24.3%	24.3%	23.5%
Ilyrian (Glagolitic) Seminary	10.6%	23.0%	21.2%	22.1%	22.6%
Kostanjsko-pograjska ljut entrepreneurial zone	12.4%	20.8%	23.5%	21.7%	21.7%
Church of St. Peter on Priko	16.8%	24.3%	17.7%	21.2%	19.9%
Lvcivs Artorivs Castvs (mythical King Arthur)	25.3%	29.1%	21.5%	11.4%	12.7%
Šćadin rainforest	17.3%	27.4%	27.0%	16.8%	11.5%

Source: prepared by the author based on the conducted research

Table 2 illustrates the attitude of respondents towards the appropriateness of the listed type of tourism in Poljica. The respondents could also propose the activities to be included in the tourist offer of Poljica, so these mostly included sport-related activities (fishing, cycling, tennis courts and golf courses). Other proposed activities included the larger number of cultural events such as theatrical performances and a "Live Museum" where the visitors could see the prince and the Poljica Statute, then glamping, the Poljica Rosary (the route connecting the churches), the

establishment of the nature park (the Šćadin rainforest and the Kostanjsko-pograjska ljut entrepreneurial zone).

The majority of respondents perceive Poljica as a historical region. In addition, the majority of respondents, even though to a lesser extent, believe that Poljica should be officially proclaimed a historical region, as evident from Graph 2.

Table 2: Types of tourism

Types of tourism	It is not appropriate at all	It is not appropriate	It is somewhat appropriate	It is appropriate	It is completely appropriate
Eco-tourism (experiential tourism)	2.2%	5.8%	23.0%	26.5%	42.5%
Rural tourism	1.8%	4.0%	25.7%	27.0%	41.6%
Cultural tourism	3.1%	3.1%	27.0%	28.8%	38.1%
Vacation tourism	3.1%	2.7%	27.0%	29.6%	37.6%
Adventure tourism	3.1%	4.4%	31.4%	27.0%	34.1%
Sports-recreational tourism	3.1%	8.4%	27.4%	29.2%	31.9%
Religious tourism	6.2%	16.8%	28.3%	27.4%	21.2%

Source: prepared by the author based on the conducted research

Graph 2: Poljica as a historical region
Source: created by the author based on the research

The comparison was also made between the replies according to the provenance of the respondents. As many as 92.5% of respondents originating from Poljica believe or completely believe that Poljica is a historical region, while 85.7% of respondents believe that it should be proclaimed a historical region. The total of 65.4% of respondents not originating from Poljica perceive Poljica as a historical region, while 53.9% believe that it should be proclaimed a historical region. The respondents believe that Poljica has the potential to become a sustainable tourist destination. The majority of respondents (62.4%) believe that Poljica should have an appropriate status within the competent local self-government units.

The research has shown that 71.2% of respondents believe that Poljica as a historical region has enough potential to become an independent and sustainable tourist destination. The total of 75.9% of respondents originating from Poljica believe that the area has the potential to

become a sustainable destination, which was supported by 55.8% of respondents not originating from Poljica.

The research has shown that 36.3% of respondents completely believe, 26.1% believe and 26% somewhat believe that Poljica should have an appropriate status within the competent self-government units. It is evident from Graph 3 that the largest number of respondents completely believe (30.5%) or believe (35%) that Poljica should have its own tourist board. The replies of the respondents originating from Poljica were compared to the replies of those not originating from Poljica. Both groups mostly believed that the tourist board of Poljica should be established, even though this was believed to a lesser extent by the respondents not originating from Poljica. In fact, 69% of respondents originating from Poljica completely believe or believe that the tourist board should be established, while the same reply was provided by 53.8% of respondents not originating from Poljica.

Graph 3: Respondents' opinion about starting tourist bord of Poljica

Source: created by the author based on the research

The respondents` attitudes concerning Poljica and the competent authorities are presented in Table 3 (1 – I completely disagree, 2 – I disagree, 3 – I somewhat agree, 4 – I agree, 5 – I completely agree). The table shows that the respondents mostly believe that the preservation of tradition is important for the local community (place, municipality, entire Poljica area). A large number of respondents expressed their desire to learn more about Poljica through organised lectures and workshops, and they mostly want Poljica to achieve a greater degree of cultural and tourist development. It should also be noted that the respondents are not satisfied with the tourist offer of the Poljica area. They believe that the competent self-government units are not sufficiently actively engaged in the preservation and promotion of Poljica and that the competent self-government units could make better use of the historical resources to advance and promote the region. The respondents believe that a better collaboration between the self-government units would contribute to the development of tourism. They believe that a direct collaboration between the public and the private sector and the local population may serve as a foundation for the development of the tourist destination, and that a precisely defined tourism development strategy would lead to the development, increase of competitiveness, larger investments. Finally, the respondents believe that the establishment of a destination management organisation and the inclusion of various sectors would ensure a sustainable long-term development of the Republic of Poljica.

Graph 4 shows that the respondents believe that their local community council is not actively engaged in the cultural and tourist development of Poljica. In addition, the majority of analysed residents of Poljica believe that the local self-government unit (municipality or city) does not work on the promotion or development of Poljica, and neither do the non-competent authorities. The total of 74% of respondents believe that the locals participate in designing the

activities related to the tourist development of Poljica only to a minor or extremely minor extent, while 70% of respondents expressed their interest in participating in the projects related to the tourist and economic development of this area.

Table 3: Respondents` attitudes about Poljica, competent self-government units and collaboration potentials

	1	**2**	**3**	**4**	**5**
a) I have been acquainted with the history and the tradition of the Poljica area.	3.1%	3.5%	36.3%	32.7%	24.3%
b) I want to learn more about Poljica through organised lectures and workshops.	3.5%	4.4%	29.2%	26.1%	36.7%
c) I want Poljica to achieve a larger degree of cultural and tourist development.	1.3%	0%	19.9%	23%	55.8%
d) Preservation of tradition is important for the local community (place, municipality, entire Poljica area).	1.3%	1.3%	14.2%	22.6%	60.6%
e) I am satisfied with the tourist offer of the Poljica area.	13.7%	27.4%	44.2%	11.5%	3.1%
f) I believe that the competent self-government units are actively engaged in the preservation and promotion of Poljica.	19%	26.1%	35.8%	12.4%	6.6%
g) The competent local self-government units can make better use of the historical resources to advance and promote the Poljica region.	0.9%	4%	23.5%	28.8%	42.9%
h) Better collaboration between the local self-government units would contribute to the development of tourism.	2.2%	2.2%	20.8%	27.9%	46.9%
i) Direct collaboration between the public sector, the private sector and the local population represents a foundation for the development of the tourist destination.	1.3%	3.1%	23.9%	28.8%	42.9%

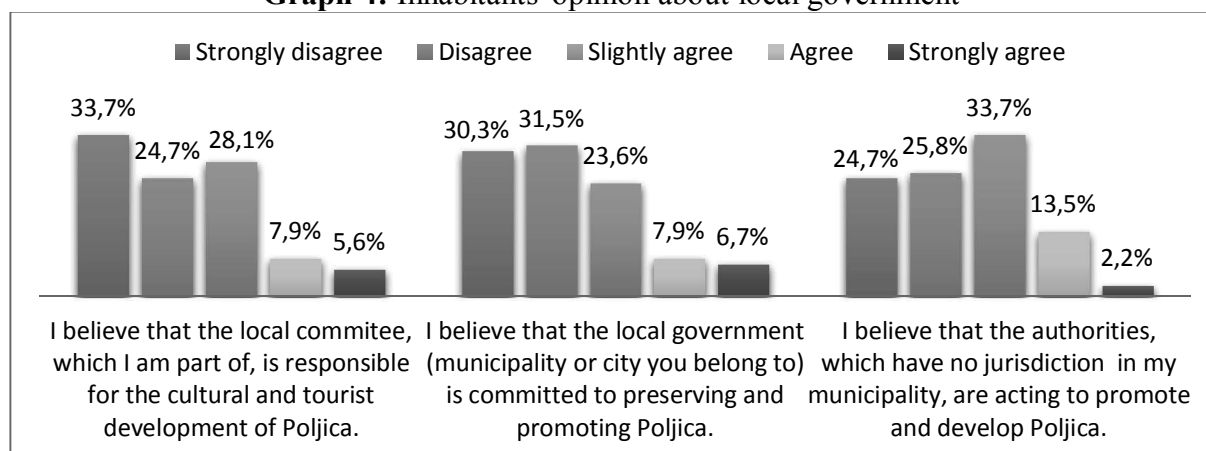
Source: prepared by the author based on the conducted research

Graph 4: Inhabitants' opinion about local government


Source: created by the author based on the research

The *second part of the primary data collection* included five tourist boards in the Poljica area. In-depth interview was used as a research method. The following tourist boards participated in this research: TB of the City of Split, TB of the City of Omiš, TB of the municipality of Dugi Rat, TB of the municipality of Podstrana and TB of the municipality of Dugopolje. All respondents concluded that Poljica has the potential and deserves to be proclaimed a modern Croatian cultural-historical region, and that the development of sustainable tourist offer based on the preservation of the cultural and gastronomic heritage may transform Poljica into a cultural-historical region. They think that Poljica has enough potential to become a sustainable tourist destination and want Poljica to reach a higher level of cultural and tourist development. They also believe that a higher level of cultural and tourist development would contribute to the strengthening of competitiveness of the area and the entire Split-Dalmatia County. The respondents consider that Poljica has the potential to develop as a tourist destination competitive with respect to other destinations, and that cultural tourism, rural tourism and eno-gastro tourism are the most suitable types of tourism for Poljica. According to the respondents, the most important resources that Poljica has are: the cultural-historical heritage, the culture of life and work, and the sea as the foundations for the development of the tourist offer. They conclude that the local self-government units and the tourist boards can make better use of their historical resources for advancing and promoting Poljica. The respondents believe that the developmental and infrastructural projects should be more supported by the regional and local self-government units with the emphasis on the preservation of natural heritage; that the competent tourist boards should provide more support in terms of creating new products; and they also stressed the importance of consultations with the local population regarding the planning of tourist development with the aim to preserve the historical resources. According to the respondents, various activities are conducted by the local self-government units/tourist boards which should promote and develop the Poljica area. The respondents assume that the local community (people) are mostly satisfied by the work of the local self-government units and the tourist boards. They are open to communication with the members of the community and try to accept all suggestions and remarks and respond to them in the optimum manner. All examined tourist boards have evaluated their work on the development of Poljica as a tourist destination as very good. Regarding the establishment of a unique tourist board for the Poljica area, the respondents consider that they should consult other tourist boards in that area and study the legislation. The unique tourist board should be established if it can act as a bearer of development on its own, but there are issues such as funding of the tourist board and its potential projects. Some respondents assume that the existing system can be used to brand Poljica without establishing the tourist board for the area. One respondent proposed the establishment of a special office within the existing competent tourist board which will exclusively handle the promotion and development of tourism in the Poljica area. All respondents agree that a direct collaboration between the public sector (local self-government units, tourist boards) and the private sector (business entities) and the local population may serve as a foundation for the development of the tourist destination. Such collaboration implies the development of the tourist offer and the implementation of certain projects aimed at the comprehensive development of the Poljica area. All entities expressed their satisfaction with the collaboration, but they believe that the collaboration can be further strengthened and improved, especially in terms of the development of new tourist products and experiences, and marketing. The respondents` vision of ideal collaboration is a timely and detailed alignment of activities and projects in collaboration with all competent entities, and regular consultations and meetings between the representatives of local self-government units/tourist boards in the course of planning of the tourism development and the marketing campaign strategies. All respondents agree that a specifically defined strategy of tourism development would lead to the development of the area, increased competitiveness, larger investments. The design and the

implementation of the strategy is indispensable for the quality systematic tourism development management. Every city/municipality has adopted their own tourism development strategy, but there is no unique strategy for the entire Poljica area. For instance, Omiš planned to adopt the comprehensive tourism development strategy in 2019, as a result of joint efforts of the city government and the competent tourist board, which is intended to include the Poljica area. It should be noted that in terms of territorial coverage, Omiš is one of the largest cities in Croatia, and the largest part of its territory is situated precisely in the Poljica area. The previously adopted strategies contain some erroneous claims about Poljica. The tourism development strategy of the municipality of Podstrana states that only part of the municipality belongs to Poljica, whereas in fact the entire area of the municipality of Podstrana belongs to Poljica. Similarly, the development strategy of the City of Split, which includes a large portion of the Poljica area and has competence over several locations in the Poljica area, does not even mention the Poljica area. It can be concluded that the strategies and the presented plans do not reflect the opinions and the intentions of the respondents.

The respondents are acquainted with the concept of destination management. They conclude that a systematic and planned management of all tourist resources is necessary for the purpose of a long-term destination development. They also consider that the establishment of a destination management organisation would ensure a sustainable long-term development, and they emphasise that an active participation of the public and the private sector is necessary within the destination management organisation. There are predispositions for its establishment, but the law has not regulated the functioning of such an organisation. In the current proposal of the new Tourist Board Act, the emphasis is on the destination management organisations which should resolve all pending issues. However, it is unclear as to when the proposal will turn into the final act.Split perceives Poljica as part of Split, and their main connection is the cultural context and the gastronomical heritage. Considering the fact that Poljica gravitates towards the city area and constitutes a part of the Split agglomeration, it is believed that the narrative of the Republic of Poljica can be incorporated into the wider city image through the development of creative cultural guides and routes connecting the historical and the traditional context. This again leads to the detachment and the failure to recognise Poljica as an integral and separate brand destination. The collaboration with other destinations in the Poljica area could contribute to a greater variety of tourist offer of the City of Split, especially in terms of dispersing the tourist activities onto less developed adjacent areas, which would eventually contribute to the uniform development of tourism in the Poljica area. Omiš is currently perceived as a city with a rapidly growing tourism, which is faced with various developmental challenges. Omiš is perceived as part of the Poljica area. The narrative of the Republic of Poljica is mostly incorporated through its history and heritage, and is perceived as rather important. The respondents believe that Omiš would become a more comprehensive destination if they collaborated with other destinations. Podstrana is perceived as part of the Poljica area, and the respondents feel affiliation with the history of Poljica that they try to preserve. The respondents believe that Podstrana would become a more comprehensive destination if they collaborated with other destinations. Dugi Rat is currently perceived as a tourist destination where tourism is considered an everyday activity of the local population. In the future, the perceive themselves as a more developed destination with an optimised tourist offer and a greater level of development of every type of tourism (eco-tourism, rural tourism, cultural tourism and vacation tourism). They perceive Dugi Rat as part of the Poljica area, and the Poljica narrative is incorporated in the image of Dugi Rat through the cultural-historical context. They believe that it would become a more comprehensive destination if they collaborated with other destinations.

A partial *limitation* of this research is the relatively small number of locals and surveyed, so it is recommended that future studies examine a larger number of locals or even generally survey the inhabitants of Croatia. The limitation may be that not all stakeholders involved in the development of the destination and the creation of the brand participated, and thus some future research could question the opinions of the Ministry of Tourism, Administration, Economy, Entrepreneurship and Crafts and such research could be a good basis for the development of the Republic of Poljica. This research may be the basis for *further research* in the Poljica area. It could also serve other similar cultural-historical regions with similar problems to conduct their research that would assist them in their development.

6. Conclusion

Tourist destination is defined as an organised spatial unit recognised on the tourist market which is perceived by the consumers as capable of entirely meeting their leisure-related needs. Since brand design has always been important, the destination branding is becoming more popular in the modern world. According to the local population, the competent local self-government units of Poljica, including municipalities and cities, local community councils and tourist boards, do not invest enough effort into the development of the destination. The proclamation of Poljica as a cultural-historical region would greatly contribute to the brand design. In the branding process, the region is perceived as an umbrella brand which connects various types of products and services whose aim is to stimulate positive experiences of end users which will eventually turn into loyalty. Considering the fact that *soparnik*, the Republic of Poljica (the Poljica Principality), Mila Gojsalić, Mosor and Cetina were listed as the first associations with Poljica by both the respondents originating and those not originating from Poljica, they can serve as the foundation for the brand design. The local population expressed their interest in the participation in projects and activities related to the tourist and economic promotion and development of Poljica. In any case, Poljica has the potential, interest of the local people and the resources for the creation of a strong, recognisable and competitive brand. According to the research results, the local population (both originating and not originating from Poljica) and the tourist boards confirmed that the definition and perception of Poljica as a unique functional unit and a historical region is a prerequisite for the branding of Poljica as a tourist destination. It is assumed that the unique character of Poljica derives from its tangible and intangible cultural heritage, geographical position, nature and other region-specific products, which is considered as a prerequisite for the creation of the tourist offer. The local population expressed their dissatisfaction with the current tourist offer of the area, and the attitudes of the locals affect the level of involvement in the activities related to the development of the region. There is also a rich sacral heritage which may be associated with the consumer`s system of belief. The collaboration between the public and the private sector and the local population is essential for the development of the tourist destination and sustainable destination management. The development of the offer based on the preservation of the cultural heritage would contribute to Poljica becoming a contemporary cultural-historical region. In addition, all respondents believe that Poljica deserves to be proclaimed as such, since it has enough potential to become a sustainable tourist destination. According to some opinions, the local self-government units and tourist boards should prepare a common tourism development strategy of Poljica which will serve as a guideline and foundation for any further activities. However, the research has shown that this has not been the case in the previous periods or in current practice. The respondents believe that the establishment of a destination management organisation would ensure a sustainable long-term development. The proposal of the new Act defines the legal grounds for the restructuring of the tourist boards system according to the model of DMOs. The new Act should contribute to the creation of all necessary prerequisites

for the implementation of destination management operations. The respondents believe that the local self-government units and tourist boards should perceive the cultural-historical attractions and sites as the foundation for creating a quality offer and the development of the destination.

In order to gain a better insight into the current position of Poljica or what is left of Poljica, this once famous historical region should be observed from the perspective of its seven competent local self-government units: the cities of Omiš, Split and Trilj, and the municipalities of Dugi Rat, Podstrana, Dugopolje and Šestanovac. Each of them, except for Dugi Rat and Podstrana which are entirely situated at the territory of Poljica but only as formal parts of Poljica, considers Poljica merely as the most undeveloped part of their area which "seeks so much, but yields so little or nothing at all". As a result, Poljica is not included in the development plans and budgets of above-mentioned local self-government units, other than as a disposal site for unnecessary or disposable products. The inferior status of Poljica is emphasised by the fact that, for decades, Poljica has not been considered a legal entity which may decide about its own fate. As a result, today Poljica is perceived as a dysfunctional spatial and social community of a questionable identity with unclear and non-existent development vision. We should not be deceived by the recently populated littoral part of Poljica (and, to a lesser extent, the middle part), because the largest part of Poljica is a completely desolate area, utterly neglected in terms of its communal and infrastructural facilities, without any essential amenities required for normal life and housing. It is particularly this "unused" historical part of Poljica, in addition to the cultural-historical and traditional heritage of Poljica, that constitutes the greatest element of value of the present-day Poljica. However, the prerequisite for the economic and demographic revival of Poljica is the functional integrity of its territory regardless of the administrative and territorial disintegration into seven local self-government units, and the incorporation of existing cultural-historical attractions and natural resources into common development projects. In order to achieve that, it is mandatory to emphasise at all times and at all levels that Poljica is a naturally, historically, culturally, developmentally and functionally a unique spatial and social unit which deserves much more with respect to its natural and human resources, and in particular its historical merits. It is paradoxical yet true that the current obstructionists of Poljica development would enjoy the greatest benefit from the revival of Poljica, since Poljica does not have its own budget. Therefore, the local population of Poljica should insist on the redefinition of the status of Poljica, especially in the context of the existing relations with the competent local self-government units, whose rational and moral obligation is to perceive Poljica as an equal and worthy partner, and consider each aid and support provided to Poljica as an investment into their own development. Consequently, the stakeholders of the social, political and economic life of Poljica should jointly engage in a unique process of revival of Poljica in order to make it into a brand name which would personify a contemporary historical region and a distinctive and unique tourist destination. Due to that, Poljica should focus on various types of sustainable tourism aimed at the "new kind of tourist", a physically and intellectually active individual who collects life experiences, adventures and stories, characterised by environmental awareness and the desire to participate in travels that would contribute to his/her personal development. Such form of tourism is ideal for the revival of Poljica and the promotion of all other types of entrepreneurship and activities because it allows for the preservation of cultural-historical and traditional heritage of Poljica, and provides new living and employment prospects for the people of Poljica.

In conclusion, the synergy of the systematised cultural-historical and traditional heritage with the natural and human resources in the context of development of sustainable tourism, the associated tertiary services (commerce, transport, services), the healthy food production (possibly organically grown), and the development of renewable energy sources (water, sun,

biomass) would create the prerequisite for the revival of Poljica as a separate and unique tourist destination whose main tourist offer is characterised by a spiritual and adventurous experience, namely the genuine hospitality and the traditional way of life and the lifestyle of Poljica area. In other words, the entire Poljica area could be branded as a large "live" museum, whose exhibits would include the preserved tangible and intangible cultural heritage of Poljica, while the people of Poljica, who genuinely live their traditional heritage in practice, could act as curators. If the local population turned to sustainable tourism based on the cultural-historical, traditional and natural heritage and the pertaining tourist offer, Poljica could be perceived as the "living room" of the central part of the Split-Dalmatia County, and possibly even farther – from Zadar to Dubrovnik. Poljica could develop a special tourist collaboration with Dubrovnik considering the fact that the the Republic of Dubrovnik and the Republic of Poljica are the only two historical Croatian republics in the territory of Dalmatia, and they are currently well-connected with the construction of the A1 Highway. When Poljica is proclaimed a contemporary historical region of Croatia and a separate and unique tourist destination whose main tourist offer is characterised by the multi-centennial way of life and the lifestyle of the Poljica area, Croatia will be honoured to have such a brand which is competitive to other similar foreign role models (Tuscany and Provence) and domestic role models (Istria and Konavle). Poljica will serve as an example of happy living to other parts of our beautiful country and a synonym for success based on the joint efforts of the curators of heritage of Poljica and the stakeholders of this exceptional area.

EXPLORING THE RELATIONSHIP BETWEEN INFORMATION TECHNOLOGY AND PROCESS ORIENTATION: CASE OF CROATIAN COMPANIES

ABSTRACT

Aims: Companies today are moving to more process-based structures. It means that in this global environment business processes represent a core of the functioning of the company because they primarily consist of processes, not products or services. In other words, nowadays, managing a business means managing its processes. The theory and practice claim that information technology (IT) is a critical enabler for the transition to business process orientation (BPO). So, the aim of this paper is to empirically test the relationship between IT and BPO. Methodology: In the theoretical part of this study an overview of process IT is presented and the theoretical background on BPO is explained. The empirical part of the paper examines if there is a statistically significant connection between IT and BPO by using correlation coefficient and regression analysis. Results: The results of the research conducted in small, middle and big Croatian companies in 2018 determined their level of BPO and their use of process IT. It can be concluded that there is a statistically significant connection between IT and BPO and that the calculated correlation is strong. Also, it is proven that the use of IT has positive influence on BPO practice. Furthermore, it is shown that the trend of BPO exists in Croatia, but there is a lot of potential for further development, especially in the field of business process informatization which is still inadequate. So, the discovered knowledge about BPO and process IT can be used as a set of practical guidelines for any Croatian company that strives to achieve more efficient business processes.

Key words: Business processes, business process orientation, information technology, empirical research, Croatian companies.

1. Introduction

Companies are continually under competitive pressure and forced to re-evaluate their business models and underline business processes (Škrinjar, Indihar Štemberger and Hernaus, 2007, 15). Zairi (1997, 73) defines a process as an approach for converting inputs into outputs. It is the way in which all the resources of the company are used in a reliable, repeatable end consistent way to achieve its goals. A business process is a coordinated chain of activities intended to produce a business result or a repeating cycle that reaches a business goal (Pourshahid, 2008, 11). The functional approach creates barriers to achieving customer satisfaction (Zairi, 1997, 74) and that is why today′s companies, in order to stay competitive, become more and more process oriented. The extensive literature and former research

conducted by McCormack and Johnson (2001, 47) and Kohlbacher (2010, 141) suggest that companies can enhance their performance by becoming process oriented. Furthermore, the more business process oriented the company is, the better it performs both from the perspective of the employees as well from an overall perspective. Reijers (2006, 399) interpreted BPO as the organizational effort to make business processes the platform for organizational structure and strategic planning. A process oriented company is according to Hammer (2007, 26) referred as process enterprise or according to Gardner (2004) as process focused company. Although the definitions of the BPO vary, in this paper the McCormack's and Johnson's (2001, 71) definition of process oriented company is adopted: the company that emphasizes processes as opposed to hierarchies with a special emphasis on outcomes and customer satisfaction (McCormack and Johnson, 2001, 82).

The practice shows that bearing in mind the multifaceted nature of business processes, and the relevant requirements of BPO companies, especially as far as information issues are concerned, it can be said that current IT, can be viewed as an enabler for business processes (Chalikias, Valiris and Chytas, 2003, 149). The lack of appropriate IT can hinder a BPO attempt quite significantly; in fact, it would not be an exaggeration to suggest that if IT is not employed in an effective manner, any attempt to embark on implementing business processes would be likely to fail (Darnton et al., 1997, 14). Further from the enabling role of IT for realising business process orientation, it should be mentioned that IT could also have a driving role in the discussed area. IT should exist within a support framework for doing business and business should not be organised according to the occasional availability of technology, but according to planned strategies and pursued goals (Chan, 2000, 231).

Referring to everything stated the goal of this paper is to empirically investigate the relationship between IT and BPO. The first chapter presents an introduction into the topic. The second chapter describes the concept of BPO. The third chapter offers an overview of IT for BPO. The fourth chapter presents empirical study of using process information technology in big, small and middle sized companies in Croatia and explores the relationship between IT and BPO. Also, it gives a discussion and the analysis of obtained results. The final, fifth chapter emphasizes the concluding remarks and the research contribution of this study, but it additionally provides the research limitations and the guidelines for future research.

2. Business process orientation

BPO can slim down operational costs, promote customer relations through satisfying customer needs better and increase employee satisfaction (Škrinjar, Indihar Štemberger and Hernaus, 2007, 13). As this is a complex process done over a long period of time, companies can attain various degrees of BPO acceptance through adjustments of their business processes. As processes mature they move from an internally focused perspective to an externally focused, system perspective. A maturity level represents a threshold, that when reached, will institutionalize a total systems view necessary to achieve a set of process goals (McCormack and Johnson, 2001, 74). Achieving each level of maturity establishes a higher level of process capability for the company. In the current business environment, there is no scarcity of process maturity models (Milanović Glavan, Bosilj Vukšić, Vlahović, 2015, 210). For the purpose of this research, the BPO maturity model and assessment instruments from McCormack (2001, 81) was used as a starting point and adapted as needed for each individual research objective. The McCormack construct (2001, 55) describes a four-step pathway for systematically advancing business processes along the maturity continuum ("AdHoc", "Defined", "Linked" and "Integrated" level). Each step builds on the work of the previous steps to apply improvement strategies that are appropriate to the current maturity

level. The following definitions for the levels that the company goes through when becoming BPO are provided (Lockamy and McCormack, 2004, 276):

(1) AdHoc, the model's first level, is characterized by poorly defined and bad structured practices. Process measurements are not applied. Also, work and organizational structures are not based on the horizontal process. Performance is unpredictable and costs are high. Cross-functional cooperation and client satisfaction levels are low.

(2) At the second level, Defined, basic processes are defined and documented. There is neither work nor organizational structure alteration. However, performance is more predictable. In order to overcome problems in the company, considerable effort is required, and costs remain high. Client satisfaction levels improve but still remain low if compared to levels reached by competitors.

(3) At the third level, Linked, the organizational structures become more horizontally prepared through the creation of authorities that overlooks functional units. Efforts for continuous improvement are made aiming to stop problems in the early phases and thus achieve better performance improvement. Cost efficiency grows and a client starts to get involved directly in the improvement efforts of intra-organizational processes.

(4) At the fourth level, Integrated, the company, its vendors and suppliers, take cooperation to the process level. Organizational structures and jobs are based on processes, and traditional functions begin to be equal to process. Process measures and management systems are deeply imbedded in the company. The company, its suppliers, and clients strategically cooperate. The process improvement objectives are geared towards teams and well reached. Costs are dramatically reduced, and client satisfaction, becomes a competitive advantage.

There are many interpretations of what BPO entails (Davenport, 1993, 14; Hammer and Champy1993, 29; McCormack and Johnson, 2001, 57). While each interpretation stresses several important points it also neglects other ones. Based on our extensive literature review we synthesize different viewpoints of BPO into a comprehensive BPO model that takes into account majority of dimensions, frequently mentioned in literature. In order to analyze and improve BPO companies need to take the following dimensions into account:

1. Strategic view;
2. Process identification and documentation;
3. Process measurement and management;
4. Process oriented organizational structure;
5. Human resources management;
6. Process oriented organizational culture;
7. Market orientation;
8. Supplier perspective;
9. Process oriented information technology.

3. Process oriented information technology

Many authors recognise the benefits of using IT in developing process orientation (Davenport, 1993, 17; Bosilj Vukšić et al., 2008, 94; Kueng and Hagen, 2007, 483). Davenport (1993, 51) writes about the positive effects of applying IT to support business processes realisation. According to him, IT enables: business processes automation, business processes duration reduction, easier collection, storing and delivery of information through forming repositories of business processes, monitoring and surveillance of business processes in real time, timely interventions, analysis of high amount of data and connecting activities in the business process. IT enables better process practice and is an essential and inevitable support to BPO. Processes and IT are strongly interrelated, and process-oriented companies inevitably need tools to manage their business processes in an automated way.

IT oriented towards business processes, i.e. process oriented information technology, includes

(Bosilj Vukšić, Hernaus, Kovačič, 2008, 77):
(1) Business process modelling and analysis tools;
(2) Business process management tools;
(3) Business process management systems.

3.1. Business process modelling and analysis programme tools

Business process modelling and analysis tools are programme solutions used by managers, IT experts, analysts and end users in order to create business process models within the company. From the functionality perspective, these tools enable users to document the existing situation, to model proposals for improvements and to calculate the expected effects of the proposed changes (Bosilj Vukšić et al., 2008, 96). Generally, it can be said that all process modelling and analysis tools generate business process maps that represent events, activities and conditions. Basic functionalities of business process modelling and analysis programme tools include: documentation of business process architecture; a series of methods for business process repository development; business process analysis and process improvement proposals design; creation of the base for information system development. It is important to emphasise that there is no best business process modelling and analysis tool. There are many modelling and analysis tools which are specialised for certain groups of users and business fields. Since so many tools have been available lately, developing a basic tool with a series of additional modules has become a trend (Lončar, 2008, 17). It attempts to meet the needs of all groups within the company in all business fields. Regardless of the growing number of "all-in-one" solutions, a company should choose a tool that corresponds to the company's own, specific needs.

3.2. Business process management suites

A few key technologies enable managers and process owners to directly control and manage the business process execution. These technologies have converged into a group of software tools called Business Process Management Suite. Business process management tools differ in possibilities, reliability and compliance with information standards as well as price. Deciding which one to buy is very difficult because the business process management tools market is relatively young and potential users lack practical experience that could be used as a guideline in choosing appropriate tools. But whichever business process management tool a company chooses, it will equip its managers with a tool for an efficient coordination of resources needed for business process execution. Furthermore, it will contribute to informatization and automatization of activities and increased performance.

3.3. Business process management systems

A business process management system (BPMS) is a platform for connecting a company's architecture, business process models, business flow management systems and information infrastructure in order to support the execution of business processes (Kueng and Hagen, 2007, 483). BPMS is an application solution enabling organisations to realise their process orientation using IT. According to most authors, process orientation implies that the company uses a BPMS to integrate people, systems and data. BPMS is an integrated group of software technologies which enable process transparency while simultaneously improving business processes and current task management.

A significant number of factors influence the success of a BPMS implementation. According to Parkes (2002, 371), process orientation of a company is an important factor influencing BPMS implementation. More precisely, as shown by practice, literature and research, a lack of process orientation causes various problems which influence the speed and costs of implementing BPMS. Since such systems facilitate business processes within an organisation

and interdepartmentally, it is crucial for the organisation to recognise the processes as tools that can be used to increase the organisation's effectiveness. The development of a BPMS is expensive and complex. It sets high demands on project participants, and its success does not depend solely on the chosen it. The support of management to the implementation of the necessary organisational changes also plays an important role (Willaert and Willems, 2006, 17). The application of BPMS overcomes the existing gap between strategic planning, introduction of a new business model and development of business process models in relation to the development of appropriate programme solutions involving IT experts (Bosilj Vukšić, Hernaus, Kovačič, 2008, 88). The aim of BPMS is to enable monitoring of critical business and success indicators in real time so that business performance and the speed of reaction to change could be improved.

4. Empirical research: Investigating the relationship between information technology and business process orientation

The aims of the conducted research were to empirically study the level of process orientation and the practice of using IT for BPO in Croatian companies and to test the relationship between IT and BPO.

4.1. Description on survey, data and methods

In order to carry out the empirical study a questionnaire was developed based on the original research of process orientation conducted by McCormack and Johnson (2001, 62). Even though their original instrument included an overall BPO construct, it was only measured with 3 dimensions. As the goal was to tap deeper into the problem the given construct was enlarged. It contained 60 questions regarding BPO characteristics. The questions were distributed across the 9 domains: Strategic view (5 questions); Process identification and documentation (6 questions); Process measurement and management (10 questions); Process oriented organizational structure (7 questions); Human resources management (5 questions); Process oriented organizational culture (6 questions); Market orientation (7 questions); Supplier perspective (3 questions); Information technology (11 questions). Each question describes a particular BPO characteristic and/or business practice considered important within each domain. The degree of presence of these characteristics in the company was measured on a 7 point Likert scale (1=Strongly disagree, 2=Disagree, 3= Disagree more than agree, 4=Neither agree or disagree, 5=Agree more than disagree, 6=Agree, 7 =Strongly Agree). One of domains of process orientation is IT and it is the important domain for the topic of this paper.

The main source of data about Croatian companies was the database of The Institute for Business Intelligence and the questionnaire was sent randomly to the 1200 companies in 2018. The questionnaire was addressed to the CEOs or the chairpersons of the companies who were instructed to fill out the questionnaire themselves or give it to a competent person within the company. The collected data were processed on a personal computer using Statistical Package for Social Sciences (SPSS). A variety of regularly used statistical approaches, were applied to data analysis: descriptive statistical analysis of collected data, descriptive analysis of mutual relationships among individual variables and the analysis and testing of statistical relationships among selected variables. 127 completed questionnaires were returned, so the final response rate was 10.58%. The selected companies were analysed according to the number of employees. In the resulting data set 40 companies had between 1 and 50 employees, 44 companies had between 50 and 249 employees and 43 companies had 250 or more employees (Graph 1). Approximately the same number of small (31%), medium (35%) and large-sized (34%) Croatian companies participated in the research.

Graph 1: Number of companies in the sample by number of employees
Source: Author's calculation

Companies from all sectors participated in the research, so all business sectors are appropriately captured in the data sample. The most common trade of business in data set was Financial and insurance services (16.53%). It was followed with Manufacturing (15.75%), Trade (11.81%) and Information and communication services (11.09%). 44.82% of the companies in the sample represented other sorts of business. Thus, the sample is an adequate representation of the population of big, small and medium sized Croatian companies from all sectors.

4.2. Results and discussion

Before all, the compound measure of BPO construct was analysed, which revealed the overall state of BPO. This was done by calculating the average grade for each domain of the questionnaire. The compound measure of the BPO in Croatia is 4.84. By using cluster analysis for previously published paper (Milanović Glavan, Bosilj Vukšić and Vlahović, 2015, 213) values were mapped in order to assess the level of BPO for each data set record (Table 1).

Table 1: BPO level mapping

BPO maturity level	Likert scale values
AdHoc	1.0-3.9
Defined	4.0-4.8
Linked	4.9-5.6
Integrated	5.7-7.0

Source: Author's calculation

Based on the compound measure of BPO and calculated values of BPO levels for data from this research it can be concluded that Croatian companies are between the Defined and Linked stage of BPO. Companies with that kind of level of BPO have well defined and documented processes, but don't realize that these business processes are connected.

Furthermore, the analysis has shown that the process information technology with its average grade of 4.18 is the worst rated domain of process orientation (Graph 2). Clearly, improvements are needed in that dimension. The low grade obtained for process information

technology dimension results from the fact that informatization of Croatian companies' business operations is primarily based on business functions, and not business processes. Business operations need to be based on processes if they are to be automatized through information technology.

Graph 2: Average grade for all BPO domains
Table 2: Average grade per each question about process information technology domain

Process information technology	Average grade
Business informatization is based on processes (not on business functions)	4.88
Our information system provides the management with relevant information on business processes effectiveness.	4.88
Our information system is flexible and adjustable to business process change.	4.66
An organization uses special programme solutions for customer relationship management.	4.03
An organization uses some aspect of e-business.	3.86
An organization has document management system.	4.62
An organization uses specialised business process modelling and analysis programme tools.	3.62
An organization uses specialised business process management tools.	3.44
An organization applies business process management system.	3.56
An organization uses business intelligence programme tools for measuring business performance.	3.65
An organization applies an integral system for business process management.	4.25

Detailed results on process information technology (Table 2) show that the weakest points of Croatian companies are: the use of BPMS (3.56) and the implementation of business processes modelling and analysis tools (3.62) which is disappointing. A number of average grades are not logical. For instance, the question on specialised tools for business process modelling and analysis was graded with lower grades than the question on application of an integral BPMS. The assumption is the following: the question was answered by the companies' managers who are not well informed on operative business process modelling and analysis tools (this is also confirmed by many unanswered questions on the issue). In the future, the use of information technology for BPO will need to be intensified. That kind of

technology contributes to the organisation's value by coordinating its processes, and giving managers modes for efficient coordination of all human and technological resources needed for execution of individual business processes.

Among the companies that have business process modelling and documenting tools, only 45.1% use them regularly and 54.9% use them occasionally or rarely. The level of BPMS use is no better. Only 48% of companies use them regularly, and 52% companies use them occasionally or rarely. As far as the business process modelling programme tools are concerned, Croatian companies most often use ARIS Toolset (mentioned in 5 cases), SharePoint (3 cases) and IBM BPM (2 cases). As far as the BPM tools are concerned, Croatian companies most often use ARIS (mentioned in 4 cases), MS Dynamics NAV (3 cases) and IBM WebSphere Business Integration Suite (2 cases).

Everything mentioned above shows that the use of IT must become imperative for Croatian companies. Also, in literature IT is stressed as a factor that enables BPO (Davenport, 1993, 36; Smith and Fingar, 2002, 102) and that is why we wanted to empirically examine the relationship between IT and BPO. For that purpose we have conducted correlation analysis between those two variables (Table 3).

Table 3: Spearman's correlation between IT and BPO

		IT	BPO
IT	Correlation	1	0,702
	p - value		0,000
	N	127	127
BPO	Correlation	0,702	1
	p - value	0,000	
	N	127	127

Source: Author's calculation

The value of Spearman's correlation coefficient is 0.702 with p-value 0.000. So, it can be stated that there is significant and positive connection between IT and BPO and according to Guilford table that kind of correlation is strong (Šošić, 2006, 136).

Empirical analysis showed that there is a strong connection between IT and BPO and that is why additionally we wanted to examine if IT influences BPO of the company. For that test regression analysis was used, where IT presented independent variable, while BPO presented dependent variable (Table 4).

Table 4: Regression analysis

Coefficients[a]							
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95,0% Confidence Interval for B	
	B	Std. Error	Beta			Lower Bound	Upper Bound
1 (Constant)	2,994	,186		16,072	,000	2,625	3,362
IT	,441	,042	,684	10,490	,000	,358	,524

a. Dependent Variable: BPO

Source: Author's calculation

Conducted analysis showed that the value of Durbin-Watson test is 1.852 and that means that the problem of autocorrelation does not exist. IT as an independent variable is significant at 1% level of significance and the estimated parameter is positive with value of 0.441, which means that IT has positive influence on BPO. Or in other words, using IT leads a company to higher levels of BPO.

5. Conclusion

Previous research and literature review have shown that IT is one of the crucial components of BPO implementation and practice. So, the main goal of this study was to examine the state of BPO and the use of process information technology in Croatian companies. The conducted research shows that companies in Croatia are between the Defined and Linked levels of BPO and that IT is the worst rated dimension of process orientation. Also, it shows that there is a strong relationship between IT and BPO and that IT has positive influence on BPO.

The collected data offer important implications for research and practice. Based on given research results conclusion is that companies from the sample could achieve higher levels of process orientation if they use process information technology more. So, discovered knowledge about BPO and process information technology can be used as a set of practical guidelines for any Croatian company that strives to achieve more efficient business processes and the results of the survey presented in this paper could provide a solid basis for further research in the field it addresses.

However, conducted research had some potential limitation. One of the limitations of this research is the fact that small, medium and large-sized companies participated in the research, and it is logical that there are great differences in BPO practice among such companies. Also, another limitation refers to the fact that the use of the questionnaire and the Likert scale lead to certain subjectivity. Furthermore, the inability to verify the truthfulness of replies certainly presents a disadvantage. Sometimes, respondents simply did not understand the questions correctly as they are unfamiliar BPO terminology.

In the future, the conducted research could be expanded by using in-depth interview methods in companies, which would help prevent misunderstandings and subjectivity of respondents during the replying process. Conclusions reached in that way could be even more objective and relevant. Furthermore, this research could encourage other similar research, which would eventually contribute to the development of this field.

STRATEGIC PLANS AND TOURISM DEVELOPMENT IN HALF CENTURY PERIOD: THE CASE OF DUBROVNIK-NERETVA COUNTY

ABSTRACT

The aim of this paper is to examine and compare strategic development plans related to tourism development planning of Dubrovnik-Neretva area from the 1960s to 2022. This study aims to investigate the impact of strategic documents on tourism development in the analysed half-century period. The level of tourism development planning in the observed period, the existence of connection between tourism planning and realised tourist arrivals and the level of implementation of those strategic documents will be analysed. Understanding the importance of planning and monitoring tourism development is essential since the plan as a document is meaningless if there is no implementation.
A desk research method was used to process secondary data, with special emphasis on the historical method. The main Strategic documents relevant for this area have been analysed to find out how tourism development of Dubrovnik-Neretva area was included in documents.
The findings indicate the inexistence of compliance between strategic documents and actual tourism development. The direction of tourism development is not clearly defined. There is connection between current political authority and strategic development plans related to tourism. A state of confusion is reached; the direction being taken is interrupted and gets a new direction resulting in a loss of time, resources and overall quality.

Key words: *strategic plan, tourism development, Project South Adriatic, Dubrovnik – Neretva area, Croatia.*

1. Introduction

This paper deals with strategic documents of tourism planning and development related to Dubrovnik-Neretva area. An initial literature review relates to tourism development planning describing the theoretical determinants. These backgrounds are well supported with corresponding empirical evidences. Since the tourism has become the main driver of Croatian economic development, it should be very carefully planned at national, regional and local levels. Considering that, theaim of this paper is to examine and compare strategic development plans related to tourism development planning of Dubrovnik-Neretva area from the 1960s to 2022s and to emphasize the importance of implementation and evaluation. The main problem was to track the data until the Independence of the Republic of Croatia. The units of local self-

government (counties) were established in 1993 and since then the territorial borders haven't changed.

First section introduce the aim and goes through the literature review of tourism planning and development. Section three is related to tourism planning and development in Dubrovnik-Neretva area in the half-century period. Next section deals with the tourism planning in the period from 1960s to 1990s, and section five considers the actual tourism planning and development from the Independence till 2022s. The last section is conclusion with ends and remarks.

2. Literature review

With the development of civilization, technical and technological breakthroughs, the requirement for planning has become increasingly apparent in everyday development including economic, cultural and social aspects. Different authors have different approaches to the concept of planning. Buble (1990, 16), defines planning as a creative process that determines in advance the direction and action of an enterprise, while Cole (1990, 114) defines planning as an activity that involves decisions related to goals, resources, behavior and results. The most comprehensive definition presents planning as a process of strategic determination of measurable goals and actions that a person, organization, or community would like to meet with a certain given period of time; it involves the formulation of policies, programmes, projects and actions for achieving development objectives (Lifuliro, et.al., 2018, 31). The concept of tourism development planning is an equally complex and complicated process with plenty of definitions. First major works of tourism development planning appeared in 1970s (Gunn, 1972; Getz, 1986; Inskeep, 1987). According to Braddon (1982, 2) tourism development planning is closely linked to development planning in most countries of the world, and many factors need to be considered, from topography to economy, welfare, tourists needs and the needs of the local population. Murphy (1985, 156) claims that tourism development planning is concerned with anticipating and regulating changes in the system, in order to promote development aimed at maximizing the social, economic and environmental benefits of the development process., and Getz (1986, 3) defines it as a process based on research and evaluation, which optimizes the potential contribution of tourism to human well-being and environmental quality while Dulcic and Petric (2001, 349) claim that it is an amalgam of economic, social and spatial consolidations that reflect the diversity of factors affecting tourism development. Few years later, Ketter, Mansfeld and Avraham (2016, 136) explained it as a comprehensive process involving the place's characteristics, development strategy, competitive advantages, resources, tourism performance, stakeholders' interests, target markets, competitors, sustainable development considerations and other external and internal factors. To optimally use, but not overuse existing resources of a destination, tourism planning should be seen as a way to maximize the benefits for a region and to minimize the problems related to tourism development (Heimerl, Peters, 2019, 283).According to Inskeep (1991, 38), basic to understand the planning of tourism development is knowledge of the components of tourism development and their interrelationships, whereas components that should be planned are: tourist attractions and activities, accommodation, other tourist facilities and services, transportation facilities and services, other infrastructure, institutional elements.

Until the second half of the 20th century, tourism development planning was based on a partial planning approach, then begins integrated approach since tourism development planning is complicated and includes physical and institutional elements. Integral tourism planning brings together economic, social, spatial, environmental and infrastructural aspects (Dulčić and Petrić, 2001, 345). Strategic tourism planning is a part of integral planning and is important because it represents a framework designed to provide direction for any tourism organisation or

destination with an emphasis on a quality, efficiency and effectiveness (Edgell et al., 2008, 297). Strategic tourism planning is directly interconnected with sustainable tourism development. Stoddard et al. (2012) suggested that tourism development organizations should obey a triple-bottom-line framework, which includes economic, environmental and social sustainability strategies. To achieve sustainable tourism goals, stakeholders play a significant role in evaluation and at an implementation stage. Nowacki (2018, 564) improved at the example of Poland real problems with implementing the principles of sustainable tourism development and that there should be a partnership between public and private sector. Grytsiuk et al. (2017, 47) emphasized the formulation of an organizational development management mechanism of tourist destinations and the construction of a model of cooperation between government, business and society. In order to develop a sustainable tourism, Mondal (2017, 164) suggested several strategies such as planning for sustainable economic profits, notifying people about sustainable tourism, and the development of the required infrastructure. Feili et al. (2017) used SWOT analysis to define sustainable tourism development strategies in Iran which included planning the progress of transportation in the region, informing people about tourism developers' activities in the media, providing accommodation for overnight and long stays, using professional managers in various tourist places and implementing existing plans. Kişi (2019, 14) in his paper claims that sustainability is meant to consider both the development and preservation of tourism. Because of that, tourism activities need to be planned, managed and monitored carefully using a long term sustainable approach.

3. Tourism planning and development in Dubrovnik-Neretva region in the half-century period

Until 1992 there were no territorial borders or division into counties since Croatia was a part of the former Yugoslavia. After the independence gained in the Homeland War (1992), began the structure of local self-governments finally established in 1993. At that time, with the foundation of 20 units of regional self-governments (counties) plus the city of Zagreb, the Dubrovnik-Neretva County was established with its head office in Dubrovnik. Territorially, the borders haven't changed since then.

Dubrovnik-Neretva County is the southern county in the Republic of Croatia and is territorially divided into 22 units of local government and self-government. It is the farthest from the Zagreb, the capital of the Republic Croatia. Economically important infrastructural facilities are the Dubrovnik airport and the international maritime ports of Dubrovnik and Ploce, the Peljesac Bridge (in the process of building), and the modern roads (still under construction). The economy of the Dubrovnik-Neretva County is predominantly oriented towards hospitality and tourism, less to agriculture that has great potential (Neretva, Ston and Konavle) or shipping (Korcula). Construction has increased considerably, and due that the real estate business has also increased, which is related to tourism growth. However, tourism is not strong enough to launch entirely economy through its multiplier effect.

Considering tourist arrivals and overnights, according the Central Bureau of Statistics, in 2019 were realized 2.285.774 tourist arrivals and 8.974.200 overnights. Analyzing the real situation, tourist traffic has been continuously increasing for the last ten years. The Figure 1 shows the number of arrivals and overnights in the Dubrovnik-Neretva area from 1985 to 2019.

Figure 1: Tourists arrivals and overnights realized in Dubrovnik-Neretva area in period 1985-2017
The analysis refers to a period of 34 years in order to show tourists circulation before, during and after the Homeland War. The number of tourists in 2014 was approximately the same as the number of tourists in the pre-war period (1985-1988). The war caused a drastic fall and decreased the number of domestic and foreign tourists. After 1999 the situation was improving, until 2009 where has been decline in tourism demand. The continuity of growth increased following years with an increase of almost 26% compared to 1985.

Investments have grown, mainly in accommodation capacities, tourist offer and overall quality. The dominant tourist centers are Dubrovnik, Konavle and Orebic – 69.93% of all overnights in Dubrovnik-Neretva area are related to them (www.dzs.hr). The most underdeveloped tourist area are municipalities in the Neretva scope, although the situation is trying to change through the offer of full-day trips.

In terms of accommodation, private accommodation still dominates, although hotels and apartments in the Dubrovnik-Neretva County are above average in relation to the national average (Figure 2).

Figure 2: Accommodation capacities in Dubrovnik-Neretva County in 2018

The share of camps in the total accommodation is 10%. There is lagging behind the offer due to the seasonal nature of the business. There are unused capacities in the County that could take a larger share of the existing structure.

As a part of tourism demand the Figure 3 shows the cruise ship passengers from 2007 to 2019 as well as cruise calls.

Figure 3: The number of cruise passengers and cruise calls in a period from a 2007 – 2019
Source: Dubrovnik Port Authority, http://www.portdubrovnik.hr/statistika/?idKat=8&godina=2019, access: 21 February 2020

The data refers to Port of Dubrovnik as the biggest one in Dubrovnik-Neretva County. Number of cruise calls decreased, but the number of passengers increased as a result of the arrival of larger cruises with more passengers. It is evident that there are some fluctuations in the number of cruise calls and passenger traffic.

Considering the air transportation, Figure below indicates the number of domestic and foreign passengers from 1985 to 2019.

Figure 4: Number of domestic and foreign passengers in Dubrovnik airport from 1985 to 2019.
Source: https://www.airport-dubrovnik.hr/index.php/hr//o-nama/poslovne-informacije/statistika, access: 22 February 2020.

In a view of the complete transport infrastructure and connectivity, it's reasonable to be oriented towards the air transport, although it is necessary to proceed urgently with construction of the Highway to Dubrovnik.

After previous analysis, the question is if there exist a coordination between tourist traffic and existing tourism development documents. Besides, it is important to determine whether such development has occurred autonomously under the impact of changes in tourism demand, or whether there have been impacts of certain tourism development planning documents.

The processed tourism development documents are shown in Table 1 refers to modern tourism up to present.

Table 1: Overview of development documents related to tourism – period from 1960s to 2022s in Dubrovnik-Neretva area

No.	Document's name	Application period	Bearer	Year of origin
1.	Social plans for the development of Kotor and the Dubrovnik economy from 1961 to 1990	1961-1990	The National Board of the Dubrovnik Municipality	1961

Of these, only those directly related to tourism development were analyzed for the Dubrovnik-Neretva area (today's Dubrovnik-Neretva County).

4. Planning in the period from the 1960s to 1990s

4.1. The Southern Adriatic Project

In the former Yugoslavia, there were no development strategies focused on tourism, projections were based on plans and programs made for specific locations and time period. Southern Adriatic Project is the oldest available strategic document related to the Southern Adriatic within which Dubrovnik-Neretva area is located. The emphasis of this analysis is on the area around Dubrovnik in order to visualize the former physical and spatial development. The document specifically analyzes the coastal area and the hinterland. First part of the document refers to natural geographical characteristics *(Regional Spatial Plan of the South Adriatic A, 1.1.4.2.)*, with the emphasis on Dubrovnik that was already highly tourist valorized and recognized as a potential worth of investing and realizing the basic interests of the country. The Ston area was characterized as a transition space from agrarian-livestock to tourist attraction as a brand new tourist area that stumbles upon initial difficulties. With regard to urban planning regulations in 1996 that required detailed information on seismic characteristics of the land, there was an intention to create a seismic map based on geophysical observations and engineering-geological and hydrogeological characteristics of the soil, so that earthquakes could be approached differently during design and construction. It was a good idea whose realization would avoid disaster in the form of economic and financial losses since the extremely strong earthquake in 1996 hit the Ston and the surrounding areas. In a component of agriculture *(Regional Spatial Plan of the South Adriatic A, 1.1.4.3)* it justified the production of the Southern Adriatic characterized by poor development, low labor productivity, fragmentation and generally poor organization. The potential was evident in horticulture, fruit and wine growing, meat, milk and cereals production. In relation to forests, there were many recommendations related to financing the conservation and legal protection in the coastal zone as a natural resource for tourism development. That document represented a certain type of sustainable development that would take care of tourist areas, complete environment and construction of all buildings and types of buildings. According to Maritime Economy *(Regional Spatial Plan of the South Adriatic A, 1.4.6)* the plan was to establish a department for nautical tourism at all tourist instances and organize the reception of large cruise ships in order to harmonize the existing yachts regulations and the regulations of neighboring countries, to stimulate the development of tourism excursions at sea, with nautical tourism in the tourist offer. Comparing with today's nautical tourism development, the situation is not satisfying due to the confusion and inadequate legislation, and the result is annually loss. The laws are incomplete and contradictory, the infrastructure of marinas, dry marinas, nautical ports and needed supporting infrastructure are not at the required level, the standards have been uphold by private firms so far. Lukovic (2017) wrote about disorder on maritime good and nautical tourism in Croatia, directly criticizing the authorities and asking for clarification of certain laws. Conclusions of the basic study Social Standard and Services – Recreation (1968) were related to recreation planning criteria based on the natural conditions. Dubrovnik, followed by Makarska, Hvar, Korcula, Budva and Ulcinj create mutually different tourist centers in the Southern Adriatic. Thus, it is proposed to build a specially equipped marina at Korcula, as well as a Sport Center for various courses, seminars, schools and events. The biggest disadvantage was the lack of planning at micro level. The supply was mostly spontaneous without market research, real needs of the local population and forecasting trends. In case of transport (Regional Spatial Plan of the South Adriatic A, 1.4.9) it implied major investments and coordination of all component authorities and investors, modernization and road constructions. Today in 2020, the highway has reached Ploce and it is unknown when it could reach Dubrovnik, the Peljesac Bridge has begun construction to connect the territory of the Republic Croatia, but the construction of access roads are still underway, the national road is being renewed every year before/during the season. The problems related to transport are investments and the lack of

implementation of the existing Transport strategy. Mentioning the improvement of landscape and nature protection (Regional Spatial Plan of the South Adriatic A, 1.4.11) it was recommended for entire southern Adriatic area to be given the status of complex protection of the entirety of the area with the laws considering spatial planning and land use with the establishment of tourist forests for the purpose of commercialization. Today, there is a high level of construction, floods regularly occur during rainfalls, almost all green areas were concreted, which made it impossible for the ground to naturally absorb excess of water. The coast is devastated and overcrowded. Last afforestation was after the giant fire in Peljesac in 2015, not for the tourist purposes but for significant loss of landscape. Considering the currently available parts of the Southern Adriatic project, a view of the spatial and urban plans and a detailed analysis of the situation in the above mentioned segments were visible, as well as guidelines for further development were quite general. The total value of the project was $ 6.952.000.00 and became only a partial basis for the following development plans, of which unfortunately, little has been realized.

4.2. Tourism Development Program for the Dubrovnik-Area in the period 1986-1990

A document referred to the wider Dubrovnik area with the main goal: reach the level of tourist construction, supply and market position of Dubrovnik and its surroundings. The total space capacities were estimated at approximately 80.000 of which nearly half of them were built by 1986. The document relied on domestic and foreign capital, bank loans, lease funds and private capital. The intention was to accelerate the development of socialist self-governing socio-economic relations, and it should have been realized through tourism system. The comparative advantages of tourism from that time were materially confirmed through significant economic valorization of natural and cultural-historical resources, tourist facilities and attractions with acquired professional experience. According to documents data, there were 905.156 tourists in the Dubrovnik area, with 5.868.240 overnights. 55.3% were in hotel accommodation with 53% overnights. 45.7% tourists were in the complementary accommodation with 47% overnights which means that tourist demand has increased. According to existing projections, the following insights were: in 1990 from 55.309 accommodations, the Dubrovnik area could reach the level of 67.058 accommodations, within which 24.658 beds would apply to hotels. It was thought that the expected increase in tourist demand would result in the occupancy of the total capacities from 106 days to 123 days in year, and hotel ones from 175 to 180 days. The projection was that it would brought nearly 1.33 million visitors, generating 8.26 million overnights. Tourism spending should have been doubled with annual rate growthof 15%, average daily consumption of 7.3%, which meant daily average consumption of $51. The hinterland of the Dubrovnik should have been a potential for excursion through which rural and gastro-tourism would be especially developed. Out of season, the focus was on developing health tourism with spa and recreational facilities. The Medarevo meant to be a New Medical Center, the Dubrovnik Littoral and Cavtat were supposed to offer rheumatic treatment services (medical mud). The potential in the congress tourism was recognized and it was proposed to raise the level of technical equipment of congress facilities. Through the development of nautical tourism, it was intended to increase nautical capacities. A marina with 250 berths should have been built in the port of Gruz, with 300 in Slano, and the existing marina in Komolac should have been expanded by 300 berths while in Korcula there was a possibility for construction of a smaller or medium marina. Smaller ports were provided at Kolocep, Sipan, Mljet, Lopud and Ston. The following problems were identified: human resources in tourism, growth of tourism economic activities - trade, agriculture, fishing and shellfish, municipal organizations, development of social activities, tourism infrastructure - commercial infrastructure, energy, roads, water management, air and maritime transport, PTT transport and

communal infrastructure, organization, self-governing organization, business organization, informatization, tourist propaganda. For each of these problems, a solution was proposed as well as project implementation measures. The entities that should be involved in proposed measures and activities were registered. Some of the projects mentioned above started their realization, the funds were secured. However, there was a period of the Homeland War, which significantly influenced the plans, strategies and development documents. As Croatia became independent, there were changes in the territorial structure, the legislative and development in general. It can be said that this was one of the first documents that can be identified with the content of today's development strategies.

5. Planning from the 1991s to 2022s

5.1. Economic Recovery program of the War-Affected Areas for Dubrovnik-Neretva County

In the Homeland War, the county's economy was degraded, as well as tourism, which is understandable and expected. According to the Law of the Counties, Towns and Municipalities in the Republic of Croatia (NN, 86/06), the structure of the current system of local self-government began in 1992 with the foundation of a basic legislative framework, and was established in 1993 when and Dubrovnik-Neretva County was set up. Due to war and the independence, the whole concept of planned tourism development and economy was automatically changed. Everything was destroyed and the changes were huge because it had to start from the beginning.Therefore, this section at first analyzes the document "Economic Recovery Program for the War-Affected Areas of Dubrovnik-Neretva County", originated from 1996. The areas covered by the document were the City of Dubrovnik, Konavle and Ston Municipalities, which were the worst victims of the Homeland War in County. According to the estimates of the County Commission for the Census and Assessment of the Direct War Damage for Dubrovnik-Neretva County, it amounted to DEM 643.476.000.

Table 2: Assessment of direct war damage in the area of the Dubrovnik-Neretva County in 1996.

Category:	DEM	%
Agriculture and fisheries	24.624.000	3.83
Industry and mining	48.566.000	7.55
Construction	34.413.000	5.35
Traffic and connections	219.583.000	34.12
Trade	28.541.000	4.44
Tourism and hospitality	254.715.000	39.58
Crafts	748.000	0.12
Housing and communal services	26.022.000	4.04
Financial, Technical and Business Services	3.813.000	0.59
Other	2.451.000	0.38
TOTAL:	**643.476.000**	**100.00**

Source: Economic Recovery Program for the War-Affected Areas of Dubrovnik-Neretva County 1996, pp. 6.

During the five-year period (1991-1995), due to armed conflicts and bombing, it was estimated that the County lost over 25 million overnights (if taken as the last successful year in 1990), and at an average daily consumption of €36.29 (Attitudes and Tourism Spending in Croatia, TOMAS, 2001) lost about $912 million in revenue from foreign and domestic tourism (Attitudes and Tourism Spending in Croatia, TOMAS, 1994). The basic objectives of the program were to optimize the use of all available natural, material and demographic resources, demographic revitalization, socially satisfactory population, coordinated and equitable economic activities, equalization of living and working conditions and social standard

throughout the County. It encouraged the use of the new Privatization law, which, unfortunately, was abused for many years due to its incompleteness and "loopholes" whose consequences are present till today. Program confirmed that tourism would continue to play the role of a basic economic system, aware that it should never again have a 70% share in the structure of a social product. The tourist offer should have been based through clusters: Konavle, Cavtat, Molunat, Župa dubrovačka, Dubrovnik Littoral and Elaphite Islands for developing rural tourism, Dubrovnik - cultural and historical with the inner city area as an exclusive tourist destination. The Neretva valley was excluded from this plan in a favour of developing an agricultural cluster which would, in addition to supplying the County's needs, market their products through the Republic of Croatia and neighboring countries. It was proposed to renovate and categorize the hotels according to the prescribed norms and habits of tourists. That was primarily related to the reduction in number of accommodation units, and the increase in recreational, sports, entertainment, cultural and other facilities, creating a comfortable and peaceful atmosphere, improving the quality of the overall tourist service and implementing a marketing business concept. Private accommodation and hospitality would be complied with the standardization of the quality of services, and would have a balanced and well-designed market appearance. Unfortunately, this part has been completely ignored and a contrary has been achieved. The fact is that in the Dubrovnik-Neretva County is the largest share of 5* hotels (31.8%), the number of beds are not reduced and recreational, sports, entertainment and cultural activities could be increased everywhere (https://mint.gov.hr/pristup-informacijama/kategorizacija-11512/arhiva-11516/11516, access: 1 March 2020). There is a lack of facilities designed to expand the offer and to be more competitive with world tourist destinations. When it comes to private accommodation, the absence of legal provisions and sanctions has resulted that each room, adequate or not, redefined the apartments for rent, which significantly affects the quality as well as the tourist offer. There were no restrictions and prohibitions of tourist construction, which resulted in an unplanned and half-wild environment that disturbs the autochthonous and ambient beauty of the environment. The biggest omission is in terms of nautical tourism. Even then, its development was not considered. The program covers only hotels and smaller accommodation facilities, which is only about the reconstruction and adaptation of existing facilities, which means that the real development strategy was absent, although there were data that could have been the basis for the development strategy of the Dubrovnik-Neretva County.

5.2. Development Strategy of Dubrovnik-Neretva County

In 2002, the Faculty of Tourism and Foreign Trade created the Development Strategy of Dubrovnik-Neretva County. The basic objective was to build democracy and economy, which included reaching GDP growth rate of 5% and reaching the level of approximately 40,000 employees by 2010, building a new tourist identity, re-affirming villages with agricultural development, investing in manufacturing and production-oriented entrepreneurship, expanding the urbanization processes from Dubrovnik to Metkovic, Opuzen, Ploce, Peljesac, Korcula and Vela Luka, including the county in the integrated transport and economic system, completing the reconstruction of war-affected areas and setting up an island development agency within the County that would referred to economic, demographic, social and cultural measures. Strategic goals in tourism were summarized in a few points (Dubrovnik-Neretva County Development Strategy, 2002): building a new identity and market repositioning of the County as one of the most important tourist destinations in the Mediterranean, tourism development based on sustainability, products diversification and development of selective tourism forms, improving the quality of overall tourist offer, better valorization and protection of the available resources, stable and long-term development of areas where tourism is one of the few possible

alternatives for economic development and employment. Through these goals, the existing mass strategy from 1980s should be abandoned and hotel facilities meant to be redirected with specialization or focus strategy. What turned out to be wrong was to identify only the hotel and hospitality industry with the financial effects of tourism, they needed to be evaluated through agencies and other activities in which tourism is multiplicatively linked (retail, agriculture, transport and municipal services). It is emphasized preservation of the comparative advantages of the County's hospitality industry, dividing residential, mass tourism into selective types such as congress, health, picnic, rural and urban tourism and development of nautical tourism, which meant great services, free custom zones across the County, not necessarily in the towns, development of various economic activities indirectly related to tourism.

5.3. Tourism Development Strategy for the Dubrovnik-Neretva County 2012 – 2022

A bottom-up cluster analysis was conducted which included several analyzes related to tourism. Key issues were well identified, namely fragmented governance and stakeholder mismatch, especially between the private and public sectors, incompatibility of tourism and development models of different clusters, limited chain value (products and services) for off-peak commercialization, low return on investment in hotel industry, inactive properties in attractive locations and problems related to visitor management and high season in the city of Dubrovnik. To solve the problem, a model of the Azure coastwas proposed which should be followed through positioning the Dubrovnik-Neretva County as a luxury-resort, 8-month destination, summer vacation and second home destination.

As objectives, the following were listed (Dubrovnik-Neretva County Tourism Development Strategy 2012-2022, 2013) and a several questions appear:

- **increase in tourist volume from 60 to 70% -** since the strategy was developed in 2013, and the number of tourist arrivals and overnights in the County (2013) reached 1.241.254 arrivals and 5.618.286 overnights, it is questionable to increase the tourist volume from 60% to 70% because there are no accommodation capacities that would follow a linear increase, and thus at the start destroys the thesis intended to escape from mass tourism. According to the number of inhabitants in Dubrovnik-Neretva County from 2011 there was 122.568 persons (http://www.edubrovnik.org/en/demographic-data/accessed: September 27, 2019), and it is unsustainable to have in a small geographical area over one million tourists without destroying the space and resources. The claims that sustainable tourism should be developed are not realistic because these are contradictory situations.
- **Increase in occupancy by 50%** - it is not clear what accommodation facilities are meant - private, hotel, camping, nautical, etc. It is unknown in which time this goal should be reached, through the year or in particular season(s) and which segment of tourists would be targeted and how.
- **Additional capacity increase of about 10.000 beds** - it is unclear in what types and categories of accommodation facilities the mentioned capacities would increase and the spatial dispersion of these facilities. Has the current status and availability of bearing capacities been analyzed, where to decrease and increase and where is the geographical area of location? There is no statistically regulated data showing the actual number of accommodations in private rental properties, there are still too many facilities that manage (despite controls) to be in "grey" as a result of renting in the sharing economy through Airbnb and similar platforms.
- **Increase in guests' consumption by 50%, increase in business volume of MICE, Rural & gastro and Nautical products based on new investments** – in what way and

by which measures to increase the consumption of tourists and visitors, where to invest, how to insure the capital and who will be in charge of restrictions?

- **Growth of events, touring and short breaks with the professional support of destination management and marketing** - destination management in County doesn't exist, as well as complete analysis of events that should become a standard part of the tourist offer (except for the Dubrovnik Summer Games), and touring in recent years is trying to revive through the various EU projects, but the awareness of local governments and self-governments is still not mature enough to withdraw funding and ensure the development of adequate infrastructure in order to enable different tours. Although according the new Law on Tourist boards, they should take this initiative (NN 52/19). As an example, the cycle path through Dubrovnik Littoral was designed as a part of the tourist offer, however, there is only tourist signage and promotion was made through the tourist fairs, without the construction of a cycling trail or adequate infrastructure that would allow users safety and protection. Tourists take the risk driving across the Napoleon road and Adriatic Highway, where groups of cyclists, buses, trucks and passenger cars travel at the same time.

These strategic goals have left a number of unanswered questions, but when it comes to sub-objectives within the clusters, the situation is different. The strategy presents the Dubrovnik Riviera clusters and individual objectives within, as in the previously mentioned development document related to post-war economic recovery (Dubrovnik-Neretva County Tourism Development Strategy 2012-2022,):

- **Dubrovnik - *Le Chic*** – with the congress center, golf courses in Konavle, and Dubrovnik Littoral, new berths, gradual conversion of cruising products according the homeport model, increasing the prices in hotel accommodation by 50%, establishing an efficient system of strategic and operational tourism management. These objectives are feasible, realistic and measurable. For each of them the financial program, the time of realization and the entities responsible for that, the priority of performance and the proposal of management techniques were presented.

- **Peljesac - Wine Empire** - a gastro-oenological heaven dominated by the first protected wines in Croatia: Dingac and Postup, oysters, mussels and other shellfish, wine cellars and gastronomic offer in Ston. The intention was to build at least one rural hotel, a new green field resort and at least 100 new units in the facilities, introduction of Pelješac culinary brands, labels and quality control, establishment of a unique mechanism for tourism and agriculture management with priority tasks of quality control and labeling. As previously, the objectives were well-defined, however, there are no management mechanisms for implementation.

- **Neretva – The expansion of life** - a combination of Neretva, karst and the sea, which is the unique feature of the County. The goals set included the creation of conditions for raising the quality of coastal accommodation, new accommodation units, camps and marinas as priority projects, ecological conservation as a real attribute and strategic priority, the process of building and protecting the Neretva Tangerine brand, harmonization of development initiatives and spatial planning framework and consensus of interest groups and cluster administrative units on the priority of tourism development.

- **Korcula - Island for life** - tradition and life of the Island through magnificent natural and urban scenery. It was planned to build new hotels, new berths and new units in rural accommodation facilities, to implement key competitiveness programs such as themed beaches, the Wine Museum in Cara, the Marko Polo Project, the Vela Spilja Archaeological Park and the Korcula Islands Olive Oil Roads. Some of the objectives are achieved, but not within the planned deadlines and with EU funds.

- **Mljet - Island Park** - identified by the diversity of natural phenomena and mystical history. It aims at doubling hotel accommodation through a new 4* resort, building new berth marinas, a cluster tourism management system that integrates key interests and is integrated with the county's management system.
- **Lastovo - Hiding place** - the trademark of the intact nature and rich tradition. One of the goals was the construction of a stop-over marina of 150 berths within 5 years, a new hotel project of at least 200 accommodation units, implementation of the diffusion hotels, the stronger integration of island agriculture and rural tourism, the realization of the project of an island multifunctional center, the cycling trails, promenade and beach fitting, managing the development of competitiveness programs and investment projects.

What is missing in the Strategy is the direction in which the County should be profiled in an increasingly demanding and competitive tourism market and the answer how to be distinctive and recognizable. It is positive to be focused on clearly defined clusters, but the question remains how to promote the County as a whole? The direction of Dubrovnik-Neretva County tourism development is not clearly defined. It can be concluded that, in relation to some previous development documents, the Strategy is more structured, but it lacks a general view of the County.

6. Conclusion

This paper analyzes 5 planning documents of Dubrovnik-Neretva County related to tourism development from the 1960s to the 2022s. The documents were made in accordance with the times, regulations and trends. Through the analysis, it is noticeable that documents have never been a problem. It is unreasonable that in times of powerful competition, state and counties don't have a vision of tourism. Strategies at national, regional and local level are not adjusted. If the national strategy is not working and is not right, regional and local strategies cannot be expected to work either.

Considering Dubrovnik-Neretva County, there are several problems that have led to this situation. At first, there is no destination management linking different stakeholders in the County: stakeholders from the public, private sector and local population to work together in order to achieve return on investment, market growth, product quality, destination brand and benefits for all stakeholders. The current strategy didn't mention promotion and it is unclear how to promote the County. However, the solutions should be offered by tourist boards that are supposed to take the role of destination management, although it is not clear how that will be implemented, as a conceptually new Law on Tourist boards provides such a role. The next problem is related to the "usurpation" of tourism. When a government changes, new strategies are made immediately, that leads to a frequent change in vision, mission and goals. A state of confusion is reached, since the direction is interrupted and gets a new way, which results in a loss of time, resources and overall quality. In this way, tourism happens spontaneously, and the achieved results are short-term, unstable and endanger the natural resources. Therefore, it is not a problem in the planning, it exists, the problem is in the implementation and monitoring, although the quality of the existing plans of different sectors could be discussed. Sanctions that would impose a fine on the heads of strategy implementation departments, people in charge of monitoring and rewards for those who works hard and do their jobs properly, would change the attitude towards tourism. It is a national strategy that should be the basis for all other strategies that go down to the regional and local levels and adapt given resources.

According to the goals in the current Strategy, the whole County should be one big construction site that would bring its projects to an end this year and next.The complete vision would change, the nautical and transport infrastructure would be better quality, there would be one

unburdening that would result in the possibility of considering the development of sustainable tourism, and thus, unfortunately, only one big wish remains.

FOREIGN DIRECT INVESTMENT INFLOWS AND ECONOMIC GROWTH IN CENTRAL AND EASTERN EUROPEAN COUNTRIES – HETERODOX APPROACH

ABSTRACT

The aim of this paper is to investigate the relationship between foreign direct investment (FDI) and economic growth. The available empirical research on the subject relationship does not provide a clear answer to the direction and intensity, as well as a sign of mutual influence. Unlike the generally assumed positive effects which FDI inflows have on economic growth, recent empirical studies found negative impact on growth or even not impact at all. On the other hand, FDI inflow benefits, inter alia, depend on the stage of development and the developmental model of the recipient country. By linking FDI inflows and the countries growth model, we obtained Central and Eastern European countries (CEE) as the predominantly demand-led growth model countries.
The study covers 15 CEE countries for the period 1995 - 2016. Initially, the Granger causality test determines the direction of influence of FDI inflows and GDP growth rate, showing that an increase in the GDP growth rate also leads to an increase in total FDI inflows, while the reverse does not hold. In the second step, the panel data analysis tests the impact of the economic growth on FDI inflows, taking selected institutional, monetary and fiscal variables as control variables. The empirical results are elaborated theoretically in the context of a heterodox post-Keynesian paradigm, which assumes that foreign capital in the case of middle-income countries leads to an increase in domestic consumption due to real exchange rate appreciation, an increase in the current account deficit, the creation of macroeconomic imbalances and "negative" reallocation of resources seeing in market seeking FDI strategy.

Key words: FDI inflow, CEE countries, heterodox economics, economic growth, post – Keynesian economic theory.

1. Introduction

The aim of the research is to test theoretically and empirically the interaction of foreign direct investment (FDI) inflows and economic growth in a sample of 15 Central and Eastern European

countries (CEE)[1]. Namely, the research done so far has not provided an unambiguous answer to the question of the direction and intensity of the interaction of FDI inflows and economic growth, which raises the question of an effective FDI attraction policy.

A critical review of the literature has identified various directions of the relationship between these variables and the different significance of the most commonly used control variables. It has been noted that, contrary to the generally accepted view, FDI can have a negative impact on growth or no impact at all.

Furthermore, the insight that the growth rate has a significant effect on inflows opens a discourse on the relationship between the growth model and the type of FDI inflows in these countries (demand-led growth model) and market- seeking FDI strategy. In regard of this, the choice of variables in the empirical model has been expanded. That is why this paper draws on a post-Keynesian theoretical framework, emphasizing the subject relationship as structural phenomenon.

The paper starts from the thesis that most CEE countries belong to countries of a demand-led growth model and which, although scarce with domestic capital, do not necessarily place foreign savings into production (productive) purposes or activities intended for export including FDI. They are usually used to finance domestic consumption, leading to appreciation of the domestic currency and distortions of current account balance with a potentially negative impact on GDP growth (Bresser - Pereira and Gala (2009)). If the recipient country is a middle- income country and there are no investment opportunities for foreign investors, then foreign capital will mainly focus on domestic consumption, i.e., the sector of non-tradable goods. Furthermore, such a sequence will also lead to the deterioration of the current account balance, that is, the creation of its deficit. Consequently, the recipient country thus becomes vulnerable to external shocks (e.g., financial crises) that can curb economic growth that was initially largely created through stimulating domestic consumption (Staehr, 2018).

Further, such a sequence according to the above authors can lead to appreciation pressures resulting in an artificial increase of real wages and further growth of personal consumption promoting market -seeking type of FDI. Therefore, the basic thesis of the paper is that the growth model determines the type of FDI coming to countries and its development potential.

Based on the post-Keynesian theoretical framework, an empirical model is developed in the third part of the paper. The usual control variables are complemented by the variables of the real exchange rate and the current account balance according to post-Keynesian theoretical framework.

The empirical research is organized in three steps. Prior to the panel data analysis, the Granger causality test was conducted, which, in line with the above, showed that FDI inflows do not affect economic growth rate (GDP growth), but GDP growth rate leads to a higher FDI inflows. Instead, it highlights the elaborated post-Keynesian theoretical framework for considering the interrelationship of the variables in question. The subject relationship is also seen in the scatter plot with the estimated regression line. The results of the four tested panel models showed, in line with the research, that the rate of GDP growth has a significant impact on overall FDI inflows in these countries, in the context of a developed institutional framework and a financial system. In addition, the panel data analysis found that there is significant impact of current account balance and real exchange rate on FDI inflows according to post-Keynesian theoretical insights.

2. Literature review and theoretical framework

Due to its characteristics (long-term investment character and lower volatility relative to portfolio and other forms of investment, FDI was considered as the most appropriate form of international capital movement with assumed positive direct and indirect effect (spill over effect) on the economy of the recipient country. In regard of this, most of the research on the relationship between FDI and economic growth has assumed a positive impact of foreign savings on economic growth while the process of European integration has particularly intensified FDI inflows in these countries.

The mainstream approaches on determinants of FDI inflows, in accordance with the neoclassical growth models, have stressed out the variables whose absence could compromise the inflow of FDI as well as its positive effect on growth. In the spirit of neoclassical growth theories, especially Lucas paradox, factors that negatively affect or limit the inflow of FDI have been explored, as is the case with the underdeveloped institutional framework in developing countries that lead to investor´s home bias. These insights explained the limitations of a more significant FDI inflows in these countries than the possible negative impact of FDI on the economic growth in recipient countries. Exactly a number of empirical studies have indicated the negative impact of FDI on growth.

Namely, one of the first papers to question this relationship was Mencinger (2003, 2008), who determines the negative impact of FDI on growth for CEE countries, explaining the FDI inflows mainly in the service sector, i.e. the lack of investment in export-oriented economic sectors. The concentration of investment in only a few service sectors (e.g. financial services, real estate and retail) can lead to a deterioration of the current account balance, i.e., an increase in consumption and imports (and thus an increase in foreign debt) at the expense of the export competitiveness of the recipient economy. The increase in the deficit is especially evident in the sub-account of income, which is generated mainly through the outflow of realized added value, i.e. profit.

Bogdan (2009), on a sample of CEE countries for the period 1990-2005, tests the hypothesis that FDI inflows have a positive effect on the economic growth of the recipient country. The impact of FDI on growth has proven to be negative (implying that foreign capital, which plays a role as a substitute for domestic savings, cannot contribute significantly to economic growth), although not statistically significant.

Pilipović, et.al. (2015) also analyse the relationship between FDI inflows and the impact of macroeconomic stability (primarily through low inflation) and openness on the example of PIGS countries, Baltic and Central and Eastern European countries for the period 1995-2012. Using fixed-effect panel models, the authors find statistically significant and theoretically based econometric analysis results; trade openness, GDP growth and membership in regional integration have a positive effect on FDI inflows.

Alfaro, Chanda, Kalemli-Özcan, and Sayek (2004), on the example of developed and developing countries, have found that FDI does not have a direct impact on economic growth, but this impact is more significant when considering financial development variables. The paper has shown that, although countries can significantly attract FDI through their measures, the weaker development of local financial markets may limit countries' ability to benefit from FDI. The functioning of financial markets is a prerequisite for FDI to drive growth in such an economy. Tang (2017) analyses the impact of the development of the financial system (market)

on FDI inflows in the period 1994-2012 in the sample of CEE countries. The author concludes that in the period 2005-2012 and in the period 1997-2004 both bank lending and the development of the capital market, measured by the size of market capitalization, had a positive effect on foreign investment.

Simionescu (2016), on a sample of 28 EU member states and for the period 2008-2014, analyses the impact of the financial crisis in the EU on the relationship between FDI inflows and economic growth. The author found a reciprocal (reciprocal/bilateral) and positive relationship between FDI inflows and economic growth, although research shows that in some countries, higher FDI inflows do not lead to higher economic growth, and that higher economic growth does not necessarily lead to increased FDI. The econometric analysis found that out of 28 EU member states, 19 had a reciprocal relationship between investment inflows and GDP growth, 7 had a non-negative reciprocal relationship, while two countries showed a specific relationship of variables whereby FDI had a negative effect on GDP growth, while GDP growth had a positive effect on the FDI inflows.

Kornecki and Raghavan (2010) also analyze the impact of FDI inflow (per stock approach) on economic growth. In the case of Poland, Slovakia, Slovenia and the Czech for the period 1990-2006, using the Granger causality test, the authors confirm the existence of impact of FDI inflows to economic growth.

Dornean and Oanea (2013) analyze the impact of the 2008 financial crisis on the relationship between the FDI level (as a percentage of GDP) and GDP growth rate, using the least square method based on an unbalanced panel model. They conclude that there is a statistically significant and positive impact on FDI, while the reverse is not true (interestingly, the level of GDP from the previous year had a positive effect on the FDI level of the current year). In addition, the dummy variable of the financial crisis turned out to be statistically significant, with a negative sign. Nevertheless, the authors cite a relatively small number of annual observations (only 22 observations) as a possible limitation of the research.

Upon completion of the literature review, it is visible
- that there is no clearly defined direction of the impact of FDI inflows on economic growth, with some of the above studies proving the negative impact of FDI inflows, that is, not establishing the significance of the relationship, nor is there any ambiguity in the interpretation of the relationship.
- that the current research on the subject relationship uses trade openness, GDP growth rates, inflation rate, the level of development of the financial system, and the development of the institutional framework used as control variables in our model for the sake of consistency of results. Namely, as the previous research shows, FDI mainly goes to those countries that have a developed financial system, a positive GDP growth rate, a favourable institutional framework and adequate monetary policy management.
- That the impact of the recent crisis in the EU had an influence on the magnitude of the inflow so the crisis variable will be also included in our model
- that most of the conducted research is using panel data models
-to put our research at the forefront of the post-Keynesian theoretical framework and accordingly the choice of variables has been extended to the real effective exchange rate (REER) variable, which greatly increases the explanatory potential of interpreting the relationships between them. It is important to note that only a few papers look at the impact of exchange rate policy elements on FDI inflows (Makhavikova (2015) and Polat (2015)). In

addition, the current account balance is included in the analysis in view of the idea based in the post- Keynesian framework that the growth model influences the developmental effects of FDI.

3. Empirical model

Considering the relationship between the GDP growth rate and FDI inflows, as an introduction to panel analysis and, in line with existing research (e.g. Mencinger, 2003), we will conduct the Granger causality test of FDI inflows and GDP growth rate. For the Granger causality test, it is important to note the following: first, the test does not detect the sign or strength of the relationship of the two variables; and second, if causality tests are performed on panel data then the pooling of data assumes that the causation direction is the same for each variable of each sample state, otherwise the estimates will be inconsistent (Mencinger, 2003). The first causality test shows that with a lag of 1 and 2 periods, GDP growth rates have a statistically significant effect on FDI inflows, at a significance level of 5% and 10%, respectively.

Table 1: Granger causality test

Pairwise Granger Causality Tests
Sample: 1995 2016

GDP_GROWTH__ANNUAL_____N does not Granger Cause FDI_INFLOWGDP		**2.91126**	**0.0560**

Source: E-views 7

Based on the results of the Granger causality test, in continuation we will analyse the impact of GDP growth rate and selected control variables on the total FDI inflows. The theoretical framework used in this paper for the analysis of assumed relationships is based on the principles of post-Keynesian economic theory. Namely, according to neoclassical economic theory, FDI inflows should lead to an increase in GDP growth, assuming that if foreign capital enters the export-oriented sectors, it would lead to higher export and an improvement in the current account balance. Otherwise, as the results of the Granger causality test show, if the causality of the variables does not go from FDI inflows to GDP growth rate, then important preconditions to attract FDI are imposed by macroeconomic conditions in the recipient country (such as the level of development of the recipient as well as the growth model according to the post-Keynesian theoretical framework).

Testing the hypothesis of the relationship between GDP growth rate and FDI inflows, will be carried out, as previously stated, using the panel data models.
Before tabulating the results of the econometric analysis, a scatterplot will be presented below with an estimated regression line between GDP growth rate and FDI inflows (in euros). The figure below shows the almost insignificant (slight positive) impact of FDI inflows on GDP

growth rate. The reason for this can be find in the sectoral structure of foreign direct investment, where most FDI inflows do not go to the manufacturing sector but to the service sector.

Graph 1: Scatterplot with estimated regression line between GDP growth rate and FDI inflows
Source: Stata 11

Further, an econometric panel analysis of the reverse impact - the impact of GDP growth and other control variables on the total FDI inflows will be conducted. Thus, this section of the paper will determine the impact of the macroeconomic environment on the size of total FDI inflows. The estimated model can be represented with the following equation:

$$FDI\_INFLOW_{it} = \alpha_i + \beta_1 GDP\_GROWTH_{it} + \beta_n X_{it} + \varepsilon_{it}$$

where *GDP_GROWTH* is the real GDP growth rate while *FDI_INFLOW* is the total FDI inflows of i unit of observation for the time period t. X_{it} represents the vector of other independent variables of dimensions 1*k in the country and for time period t. The parameter α_i is a constant term different for each unit of observation, $\beta_1,...,\beta_K$ are the parameters to be estimated, while ε_{it} is the estimation error of i unit of observation for time period t and are assumed to be independently and identically distributed random variables across observation units and time, with mean 0 and a variance σ^2.

Three models were tested in total, using trade openness, inflation rate, domestic loans to the private sector, GDP growth rate, and the current account balance (in % of GDP) as control variables. In order to catch the effect of the recent crisis on total FDI inflows we will also include in the model a dummy variable where for the crisis years the variable has a value of 1 (2009-2013), while for the other years the variable has a value of 0. The model also considers the impact of the institutional framework on the total FDI inflows. Using factor analysis (according to Globerman and Shapiro, 2002), the first principal component of the six World Governance Index indicators will be extracted, which then will be used as a proxy variable of the institutional setting in econometric analysis.

Among the control variables the FDI inflows variable (stock approach) will be included in the model as an indicator of agglomeration effect (according to Walsh and Yu, 2010). The variable of total FDI inflows will be used as the dependent variable. For the purposes of panel data analysis, the logarithmic values of the dependent variables will be used. A fixed-effect AR (1) estimator based on Bogdan (2009) was selected to evaluate the parameters based on the Hausman specification test. In the Appendix we also present panel data analysis using PCSE estimator

Table 2: Results of the econometric panel data analysis (impact of GDP growth rate on total FDI inflows)

*, **, *** statistical significance at 10%, 5% and 1%. The standard errors of estimation are in parentheses

As noted above, three models were tested. In all tested models, the variable of GDP growth rate, as expected, showed a statistically significant and positive influence on the dependent variable. Furthermore, the trade openness variable in the tested models also showed a positive influence on the total FDI inflows. The variable of the current account balance (percentage of GDP) in the tested models showed a negative impact on the total FDI inflows, with this effect being statistically significant in two models. According to Staehr (2018), who analyses the relationship between real GDP growth rate and the current account balance on the example of 11 CEE countries for the period 1997–2015, the relationship between the two variables mentioned is inverse; an improvement in GDP, that is, an increase in its growth rate leads to a worsening of the current account balance meaning an increase in its deficit. In the opposite case, as a result of the GDP decline (falling growth rate) there is an improvement in the current account balance - deficit reduction/surplus increase. Considering that the FDI inflows is partly used to finance current account deficit, then their negative relationship suggested by the panel analysis has a logical and economically based explanation; an improvement in the current account balance leads to a reduced need for inflows of various forms of capital (including FDI), while the existence of a negative balance leads to an increase in capital inflows to cover the current account deficit. This may be due to the export orientation of such an investments (and thus to the improvement of foreign trade balance), as opposed to investment in the service sector, which does not necessarily contribute to export growth but to market expansion, i.e., to a greater market share of foreign investor.

The quality of the institutional environment did not prove to be statistically significant, although the improvement of the institutional environment has a positive impact on the total FDI inflows. Also, the financial system development variable, viewed through the indicator of domestic loans to the private sector, showed a slight negative (neutral) impact, which supports the thesis that FDI inflows into the service sector for the purpose of expanding the market and harnessing

the purchasing power of domestic consumers correlate positively with the developed financial market in the recipient country.

In conclusion, from all three models tested, it is possible to confirm the thesis about the existence of basic preconditions (thresholds) that affect the total FDI inflows and which are in accordance with the well-stated post-Keynesian theoretical framework. Namely, a joint analysis of all three tested models can lead to a common conclusion about economic growth as a pull factor.

Further, the impact of the index of real effective exchange rate on the FDI inflows will be also econometrically tested[2]. As the literature review shows, the one of the key exchange variables is the index of the real effective exchange rate (and not the nominal effective exchange rate), so the analysis will be based only on that relationship. Inflation rate, real GDP growth rate and current account balance (in percentage of GDP) were used as control variables in the model. The tested model can be represented by the following equation (Walsh and Yu (2010) and Kinoshita (2011), also analysed the relationship between the real exchange rate index and total FDI inflows):

$$FDI\_INFLOW_{it} = \alpha_i + \beta_1 REER_{it} + \beta_n X_{it} + \varepsilon_{it}$$

where *REER* is the real effective exchange rate while *FDI_INFLOW* is the total FDI inflows of i unit of observation for the time period t. X_{it} represents the vector of other independent variables of dimensions 1*k in the country and for time period t. The parameter α_i is a constant term different for each unit of observation, $\beta_1, ..., \beta_K$ are the parameters to be estimated, while ε_{it} is the estimation error of i unit of observation for time period t and are assumed to be independently and identically distributed random variables across observation units and time, with mean 0 and a variance σ^2.

The econometric analysis will use the Wooldridge test for autocorrelation in panel data. In addition, to avoid heteroscedasticity of residuals, a robust standard estimation error will be used in the model. In the Appendix, we also present panel data analysis using PCSE estimator.

---

[2] Due to lack of real exchange rate observations for four countries this model will be tested on 11 CEE countries. The indices of nominal and real effective exchange rate are calculated on an annual basis as the arithmetic mean of monthly index values, according to the available exchange rate database of the Bank for International Settlements (BIS). The real exchange rate is calculated as the nominal effective exchange rate corrected for relative consumer prices. Increasing the index means appreciation, and its decreasing means depreciation of the real exchange rate.

As it can be seen from the table above, the index of real effective exchange rate (REER) showed a theoretically grounded (in line with the above mentioned studies) and statistically significant influence on the dependent variable. In the first estimated model, where the variable of total FDI inflows was used as a dependent variable, the variable of the real effective exchange rate turned out to be statistically significant at the level of 1% with a positive and relatively strong economic effect. In the first model, the inflation variable, the GDP growth rate variable and current account balance variable were also used as control variables. The inflation variable did not prove to be statistically significant, while the other two control variables showed a positive or negative economic impact, at 10% and 1% significance levels, respectively. The effect of the variable of the real effective exchange rate index on the dependent variable can be interpreted in the way that appreciation of the real exchange rate leads to an increased total FDI inflows, bearing in mind that investment in the service sector prevails in the case of individual sample countries. Furthermore, the GDP growth rate variable expectedly showed a positive impact on total FDI inflows, while the current account balance variable, incidentally as in the previous panel model, showed a negative impact on FDI inflows, showing also in this model that, looking at the sample level, FDI mainly worsens the current account balance, that is, leads to an increase in its deficit.

By linking the above results of econometric analysis with the context of the post-Keynesian theoretical framework, it can be concluded that, given the adopted growth models, GDP growth rates lead to an increase in foreign direct investment inflows (whereby the reverse is not true in the sample of countries from the survey). The analysis can implicitly conclude that the majority of FDI inflows goes to the non-tradable goods sector, which generally does not lead to an increase in the physical capital accumulation in the recipient country and its export orientation, but leads to an increase in domestic consumption by a market-seeking motive of foreign investor. As a result, there is an increase in the current account deficits and appreciation pressures on the real exchange rate (Bresser-Pereira, 2009). The onset of the crisis (a dummy variable in the model) led to a decrease in total FDI inflows and an improvement in the current account balance but also a slowdown in economic growth (Staehr, 2018).

4. Concluding remarks

Survey results from a sample of 15 Central and Eastern European countries confirmed the basic thesis that GDP growth is a factor that influences FDI inflows, while in the context of demand-led growth model, the same effect does not apply *vice versa*. In addition, the panel analysis confirmed the role of the institutional infrastructure and the development of the recipient country's financial system as a pull factor. Using the variable of the real effective exchange rate, which has a positive impact on the total FDI inflows, we expanded the theoretical scope of analyses. Namely, capital inflow leads to real exchange rate appreciation causing current account deficit. The import expanded economy (demand led growth model) influences then the sectoral structure of FDI. The research findings were then explained in the context of heterodox economic theory, highlighting, for this sample of countries, the overwhelming role of FDI in stimulating domestic consumption at the expense of export orientation and the consequent deepening of the country's current account deficit.

Using a post-Keynesian methodology, the transmission from capital inflows and exchange rate appreciation to increased consumption and FDI inflows into non-export sectors are making country vulnerable to shocks and unsustainable economic growth based on increasing indebtedness. In doing so, we have shown that the interaction between economic growth and FDI is primarily a structural phenomenon. The change in this structural relationship must be based on a change in countries investment policy (public as well as private), an increase in GDP based on export, thus in attracting FDI to export branches (changing the sectoral structure of

FDI). FDI is an endogenous variable which inflows structure depends on the country's long-term economic model. The growth model based on domestic savings will attract export oriented FDI inflows. The analysis of sectoral structure of FDI inflows is of the most importance to understand this relationship, but it is beyond the scope of our paper at the moment.

THE LEGAL EFFECTS OF THE *Lex Agrokor* ACT AND ITS SIGNIFICANCE IN REGIONAL AND SECURITY CONTEXT

ABSTRACT

The paper examines the meaning, content and legal effect of the decision of the Constitutional Court of the Republic of Croatia on the conformity of the Act on Extraordinary Administration Procedure in Companies of Systemic Importance for the Republic of Croatia – Lex Agrokor ("Official Gazette" No. 32/17.; hereinafter: the Act) with the Constitution, and its significance in regional and (national) security context. The Act has significantly changed the legal system of the Republic of Croatia, which has hitherto regulated insolvency law, company law and contractual relations, which have been applied in Croatian legal tradition for years, and introduced new standards governing specific situations of corporate insolvency of systemic importance for the Republic of Croatia. Since 2 May 2018, by decision No. U-I-1694/2017 et al., the Constitutional Court established the constitutionality and conformity of the disputed Act with the Constitution by not accepting the proposals of the twelve petitioners for review of its constitutionality. The procedures before the the Constitutional Court were unique in the existing Constitutional Court practice, and the legislative and executive authorities passed the test of justification for the adoption of this Act, therefore undoubtedly contributing to the economic stability of the Act, and consequently (in)directly affecting the regional-demographic phenomenon, and ultimately the protection of national interests and security. Therefore, the authors in this paper (by case study method, normative analyses,) give an overview of the course and characteristics of the Constitutional court procedures, determine under which basic constitutional values and principles (such as: welfare state, social justice, security, the requirement of proportionality, legitimate aim, the rule of law and equality, and due process) the Constitutional Court has classified the petitioners' stated objections, and provide an overview - the connection between the legal effect of the challenged Act for the legislator and its effect in the regional and security context.

Key words*: extraordinary administration, Constitutional Court of the Republic of Croatia, economic system, demographic impact, security aspect.*

1. Introduction

Constitutional Court of the Republic of Croatia (hereinafter: the Constitutional Court) by Decision No. U-I-1694/2017. et al., dated 2 May 2018 (hereinafter: the Decision), did not accept the proposals to initiate the procedure for reviewing the conformity with the Constitution of certain articles of the Act on Extraordinary Administration Procedure in Companies of Systemic Importance for the Republic of Croatia - *Lex Agrokor* ("Official Gazette" No. 32/17, hereinafter: the Act) nor the Act as a whole. The decision was adopted by a majority vote, with separate opinions of three judges forming an integral part of the Decision. This is one of the most significant decisions of the Constitutional Court, since the Act introduced new norms regulating specific situations of insolvency of companies of systemic importance for the Republic of Croatia.

The process for reviewing constitutionality of the Act was initiated by twelve petitioners, and the proposals were gradually submitted in the period from 2017 to 2018. All twelve proposals were consolidated into one constitutional court procedure, which enabled a thorough examination of the Act. Although allowed by the Constitutional Act on the Constitutional Court[1] (Article 38, paragraph 2), the Constitutional Court did not decide on its own initiative on the constitutionality of the provisions of the Act. The ensuing procedure was unique in the constitutional court practice so far. Therefore, the authors of this paper, by analyzing the constitutional court procedure, will try to emphasize the connectivity of the welfare state elements/principles, respect for social justice, security, the requirement of proportionality, the achievement of a legitimate aim, the principle of the rule of law with the very reason for enacting the act in question and empowering it by the Constitutional Court Decision, all with the possible protection of national security elements. This is an extremely important and interesting topic that has not been sufficiently explored in the Croatian or foreign literature. The paper is structured into four chapters using normative analysis and case study methods. After the first, introductory chapter, in the second part of the paper the authors describe the procedure for evaluating the conformity of the Act with the Constitution of the Republic of Croatia, first describing the features of the impugned Act, and then analysing the petitioner's complaints and the evaluation of the Constitutional Court. The third part of the paper analyses the effects of the decision of the Constitutional Court in the service of protection of social, demographic and national security interests of the Republic of Croatia. Finally, in the fourth chapter we bring a conclusion.

2. Procedure for Reviewing the Conformity with the Constitution

A feature of this Act, apart from its significance in the legal order, is the sensitivity of the matter and the nature it regulates. Namely, the Act follows a significantly different approach to dealing with the illiquidity of the company than the approach on which the insolvency legislative framework[2] was built. The situation is particularly complex because the matter it processes is characterized by the protection of the viability of a company, which, together with its subsidiaries and affiliates, affects the overall economic and financial stability in the Republic of Croatia.

---

[1] Constitutional Act on the Constitutional Court of the Republic of Croatia ("Official Gazette" No. 99/99, 29/02 and 49/02 - consolidated text; hereinafter: the Constitutional Act).

[2] Insolvency legislative framework enables agreement on the continuation of the business of an illiquid company, but

its primary purpose is to ensure a fair distribution of the debtor's assets, namely to ensure the highest degree of debt repayment to the creditors in case of liquidation (Dissenting opinion, 2018, 3).

In order to make the best possible decision, the Constitutional Court requested and received extensive documentation from the competent ministries (the Ministry of Finance and the Ministry of Justice), the statements of the Government (5 of them), expert opinion on the submitted proposals by full professor Biljana Kostadinov from the Department of Constitutional Law at the Faculty of Law, University of Zagreb (hereinafter: expert opinion), and also considered the European Commission Recommendation on a new approach to insolvency and insolvency of companies.[3]

In the present case, the Constitutional Court was faced with a great challenge, and in deciding on the constitutionality of the impugned Act, it struggled with extensive and sensitive matter and sought to make the best possible decision. In spite of major problems and public pressure, the Constitutional Court (based on the Article 29 paragraph 1 and Article 43 paragraph 1 and 2, Constitutional Act) issued, in our opinion, a very thorough and quality solution on 2 May 2018.

2.1. Features of the Impugned Act

In its assessment, the Constitutional Court proceeded from the essential features of the impugned Act, which it later examined primarily through the concept of the welfare state and social justice. The first feature of the impugned Act is its aim, which is to protect the sustainability of business activities of companies of systemic importance for the Republic of Croatia, which by their business independently or together with their subsidiaries or affiliates affect the overall economic, social and financial stability in the Republic of Croatia. In order to achieve this aim, the Act establishes a mechanism for restructuring the financing and/or business activities of a company which is, due to its illiquidity, threatened by the collapse of business and possible liquidation in the course of insolvency procedures, which, given its business networking and economic impact, would have extremely grave consequences for the whole economy, which would disrupt market operations, the financial system and the social security system. Another important feature of the Act is the measure (mechanism) of extraordinary administration[4] for companies of systemic importance for the Republic of

---

[3] European Commission adopted the Recommendation on 12 March 2014, based on the Article 292 of the Treaty on the Functioning of the European Union, (hereinafter: TFEU), in order to promote greater consistency between national insolvency frameworks, reduce ineffectiveness and deviations that hinder early restructuring of viable companies in financial difficulties, and provide a second chance to honest entrepreneurs. See: Commission Recommendation 2014/135/EU of 12 March 2014 on a new approach to handling business failure and insolvency, OJ L 74, 14.3.2014, pp. 65–70.

[4] Extraordinary Administration Procedure shall be initiated on the proposal of the debtor who fulfils the conditions of
Article 4 of the Act or the debtor's creditor and/or the debtor's affiliates or subsidiaries, with the consent of the debtor. The proposal is submitted to the Zagreb Commercial Court as the only competent court, which is obliged to inform the Government and the Ministry of Economy, Entrepreneurship and Crafts on the same day. The initiated procedure is urgent and is subject to the rules from a separate Act governing insolvency procedure. During the Extraordinary Administration Procedure, the initiation of procedure for the liquidation of the debtor, pre-insolvency and insolvency procedures is not allowed. No civil, enforcement, or assurance procedures, as well as out-of-court collection enforcement against the debtor and its subsidiaries and affiliates (except those related to labour disputes) are not allowed from the date of the opening of the Extraordinary Administration Procedure, whilst the previous pending procedures are terminated. The governing bodies of the Extraordinary Administration Procedure are the Court, the Extraordinary Commissioner, the Advisory Body and the Creditors' Council. The Court may at any time (during the course of Extraordinary Administration Procedure) at the request of the Extraordinary Commissioner, with prior consent of the Creditors' Council, decide to terminate the Extraordinary Administration Procedure and to open insolvency procedures if it determines that there is no possibility for further establishment of economic balance and the continuation of the debtor's business on a permanent basis. Extraordinary Administration Procedure ends with the validity of the decision on suspension of the Extraordinary Administration Procedure, the execution of the settlement within 15 months from the day of opening the

Croatia, which is carried out in a special procedure regulated by the Act, which specifically elaborates the prerequisites for opening an extraordinary administration procedure, the legal consequences of opening and implementing this procedure. Through the mechanism of extraordinary administration, the legislator tried to provide the conditions for restructuring of a failed company by changing the existing financing conditions of the company or reorganizing its institutional corporate structure and business practices in order to prevent its liquidation and enable the continuation of business. (Solution, 2018, 6-9).

The impetus for the above mentioned to the legislator was also the fact that the mechanism of extraordinary administration which tries to provide a "second chance" to illiquid companies by business restructuring in order to avoid liquidation is also known in market economy companies and their legal systems. Moreover, this is further reinforced by the adoption of Directive (EU) 2019/1023 on preventive restructuring frameworks, discharge of debt and disqualifications, and measures to increase the efficiency of procedures considering restructuring, insolvency and discharge of debt, and amending Directive (EU) 2017/1132 (Directive on Restructuring and Insolvency).[5]

What is important is that such a legislative solution should ultimately lead to the prevention of the economic and social crisis that could have arisen by the overflow of the effects of illiquidity, as well as the consequences of business failure on the creditors of the failed company, its employees and related financial institutions.

3. The Petitioners' Objections and the Constitutional Court's Assessment

The Constitutional Court reduced the petitioners' complaints to two basic objections, namely the complaints aimed at the formal (in)compliance of the Act with the Constitution, and then the complaints aimed at the material incompliance of the Act with the Constitution, namely some of its articles. In relation to complaints of a formal nature, the legislator is allowed to pass an emergency procedure in exceptional situations, when there are justified reasons for this, which must be specifically explained. In this case, the Government justified the adoption of the Act in a valid and sufficient manner based on the extraordinary circumstances of a major and uncontrolled disturbance of the economic system, as well as the insufficient and ineffective legal framework of the pre-insolvency and insolvency procedures, which are considered to be valid reasons. Thus, in this particular case, there was an urgent need to protect an important social interest. In relation to *vacatio legis* (decision on when an Act is going to enter into force), it is pointed out that the Constitution knows and allows an exception in determining a different (shorter) *vacatio legis,* which is read from the second sentence of Article 90 (3) of the Constitution[6], which permits a shorter period for the act may enter into force and is thus allowed to be on the first day after its publication in the Official Gazette. The fact is that the Act was voted by a majority vote of (all) MPs, so it is an organic law, which undeniably speaks of its importance and the constitutional rank it has been given.

In assessing the material compliance of the Act as a whole or of some of its articles with the Constitution, the Constitutional Court started from the concept of welfare state and social

---

Extraordinary Administration Procedure, if no settlement has been concluded within that period. (Article 4, 6, 7, 9, 24, 45 and 45 of the Act).

[5] Directive (EU) 2019/1023 of the European Parliament and Council of 20 June 2019, OJ L 172, 26.6.2019, pp. 18–

55.

[6] Article 90(3) of the Constitution of the Republic of Croatia ("Official Gazette" No. 56/90, 135/97, 113/00, 28/01, 76/10 and 5/14; hereinafter: Constitution) prescribes that the act enters into force no earlier that the eighth day after

its promulgation, unless otherwise defined by the act for justified reasons.

justice and the accepted doctrine of economic neutrality of the Constitution.[7] This is especially so because it has been objected that there is no reason to introduce the law, that it does not have a legitimate aim and that it has encouraged the nationalization of the Agrokor Group.

Article 1 of the Constitution defines the Republic of Croatia as a welfare state, which implies its obligation to promote economic progress and social wellbeing and economic development of all its regions (Article 49), as well as ensuring social justice (Article 3) as the highest values of the constitutional order. From this constitutional framework emerges the leading role and obligation of the state in securing state welfare both in protecting fundamental human rights and freedoms and in undertaking economic and social measures.

The concept of the welfare state has three functions, namely those which enable different forms of positive measures of state and public authorities in the economic field, such as state interventionism and "top-down governance", which obliges the state and public authorities to influence or to interfere with the market function (to ensure the realization of fundamental social rights, to achieve social security and to equalize or reduce extreme social disparities) and those forbidding the dissolution of the basic structures of the welfare state or the radical restriction of recognized social rights (Decision, 2018, 39). All these tasks must be carried out by the state government, respecting the principle of the rule of law, as one of the fundamental values guaranteed by Article 3 of the Constitution. The fundamental component of the welfare state is social justice as one of the highest values of the constitutional order of the Republic of Croatia, whose function (apart from being the basis for interpreting the Constitution) is reflected in the obligation of the state to engage in the legislative plan in establishing and maintaining the social order. Constitutional review of legislative activity within the framework of the principles of the welfare state and social justice is of particular importance in assessing whether the legislator has found the optimal compromise (balance) between the two opposing constitutional values, as in the present case. This refers to the constitutionally guaranteed entrepreneurial and market freedoms on the one hand and the realization of the concept of a welfare state in the framework of which there is no foreign intervention of the state into the private legal field, on the other. The aforementioned intervention is allowed in situations of drastic economic imbalance and economic and social crisis, as in this particular case.[8]

Furthermore, within the concept of the welfare state on the basis of which the state has an obligation to care for a just social order, the Constitutional Court also questioned the freedom of the legislator in economic policy making, or whether it exceeded (violated) it in this particular case. In assessing the above, he emphasizes the importance of the doctrine of economic neutrality of the Constitution (and of constitutional judges) according to economic

---

[7] In the Decision No.: U-IP-3820/2009 et al. of 17 November 2009 ("Official Gazette" No. 143/09) the Constitutional

Court stated its views on the welfare state standards and the social justice principles. Constitutional Court reiterated

them in its later practice (Decision No. U-I-3685/2015 et al. of 4 April 2017).

[8] "*At the time the Report was written, Agrokor had more than 56,000 employees in Croatia and abroad, representing*

4.78% of the total number of persons in paid employment in legal entities in the Republic of Croatia. The size, territorial distribution and the interweaving of the Agrokor Group's business activities with the activities of a large number of entities in the rest of the Croatian economy indicated the danger of overflowing difficulties from the systematically important companies to the rest of the economy. For example, Konzum alone, as one of the constituents of the Agrokor Group, had more than 2,500 suppliers with approximately 150,000 employees (accounting for 12% of employees in legal entities, or 10.9% of the total employees in the Republic of Croatia), and the discontinuity of that constituent alone had the potential to threaten job security in the rest of the economy - which could affect as much as 10.9% of the total employees and their family members throughout the territory of the Republic of Croatia. In addition, the Agrokor Group maintained business relationships with twenty-one (21) credit institutions in the Republic of Croatia, and the exposure of certain credit institutions to Agrokor was at the maximum legal level (approximately 25% of their guarantee fund)." (Decision, 2018, 35).

policies and the freedom to choose a legislator. [9] The aforementioned freedom to choose the economic policy of the legislator (the Croatian Parliament) stems from Article 2, paragraph 4, indent 1 of the Constitution. By applying the aforementioned to the specific case and considering the welfare state principle, the Constitutional Court emphasizes that the state (legislator), in a situation of unfavourable economic and monetary trends (which could have a negative effect on the economy of the Republic of Croatia due to the sudden and uncontrolled breakdown of companies of systemic importance[10]), with an inadequate and ineffective existing legal model to prevent it, had an obligation to take the necessary economic policy measures to eliminate this danger and preserve social rights and social security. The impugned Act therefore satisfies the constitutionally established requirements in the light of the designation of the Republic of Croatia as a welfare state while ensuring social justice and economic neutrality of the Constitution. Considering the above, it follows that the legislator was free to designate such a legislative solution (to ensure the sustainability of business according to certain criteria) as an objective of public interest. Taking into account the detailed and extensive reasons the Government has listed for adopting such a legislative solution, and taking into account all the risks that threatened the entire economy, the Constitutional Court assessed that the Act has a legitimate aim, and that is to protect the sustainability of business activities of companies of systemic importance for the Republic Croatia, in order to prevent the negative effects on the overall economic, social and financial stability of the Republic of Croatia that could arise from the sudden discontinuity and/or dissolution of such companies.

Since the institute of insolvency or pre-insolvency procedures could not ensure the continuity of business activities of a company of systemic importance and prevent the chain of negative effects on the rest of the economy, the impugned measure was necessary, that is, there was no other less restrictive measure, and the Constitutional Court found that the impugned measure (Act) was necessary to achieve the goal. In light of the assessment of whether the Act places an excessive burden on the debtor as an addressee of the Act, it is emphasized that the aim is to enable a sustainable company of systemic importance for the Republic of Croatia, which has run into financial difficulties (the debtor), to continue its business through financial and operational restructuring, and that the Extraordinary Administration Procedure cannot be conducted without the debtor's consent, which implies that a legitimate aim, apart from financial, can be achieved through operational restructuring.[11] Consequently, the impugned

---

[9] *"Croatian Parliament is free to choose economic policy for the positive realization of economic and social rights from the Constitution of the Republic of Croatia. The Constitution of the Republic of Croatia does not guarantee the*
neutrality of the executive and legislative authorities in the field of economic policy, or social market economy which would exclusively be subject to rules that respect market mechanisms. More specifically, the neutrality (tolerance) of the Constitution and constitutional judges towards the economic policies of the legislator, with recognition of parliamentary and governmental responsibility for the economy. The limited constitutional control over the legislator does not reflect the doctrinal attitude of passivity towards parliaments, but it is an expression of an economic constitution that advocates the active role of the state in the economy where the courts believe that the states can pursue very broad goals in the public interest, including the interests of widely understood economic policy." (Decision, 2018, 41).

[10] For example, at the time of the opening of the Extraordinary Administration Procedure against the Agrokor Group,
that is, until 31 March 2017, the total amount of blockages in the accounts of fifteen (15) Agrokor companies amounted to more than 3 billion kuna /HRK 3,030,619,459.00/, of which a total of just over three hundred and twenty one million kuna were repaid /HRK 321,988,729.00/; after the unblocking the total balance in the accounts of these companies was HRK 6.00, the supply of retail companies was extremely difficult or completely stopped, the continuity of livestock and agricultural production was threatened.

[11] In the case of the Agrokor Group, the management of the Agrokor d.d. at the time (in which the proponent Todorić was the president) has brought a decision on 7 April 2017 which initiated Extraordinary Administration Procedure against that company, with its subsidiaries and affiliates. In other words, the Extraordinary Administration Procedure would not have been initiated if the management of Agrokor d.d. at the time did not

measure was found not to be an undue burden on creditors. This is because creditors make a settlement that cannot be concluded without their participation and confirmation; therefore, it depends on them whether the settlement will be concluded[12]. In the Extraordinary Administration Procedure, there can be no question of "expropriation of property" because the Act knows only procedural, but not material (substantive) consolidation. In other words, it is a procedure for settling creditors and restructuring debtors, in which only one single settlement can be proposed.

In conclusion, the Constitutional Court states that placing the Agrokor Group under Extraordinary Administration did not place an additional burden on the State compared to the situation that would arise in the case of applying the usual insolvency rules because the Act allows restructuring without the using public funds. Despite the aforementioned, the Constitutional Court's decision was not adopted unanimously, namely, it was not supported by three judges. In their dissenting opinions, they essentially state that find it problematic that the legitimate aim (which some of them think is absent and not justified) that justifies the adoption of the Act is primarily expressed through the welfare state principle. They believe that the reasons of economic nature just even more convincingly indicate the legislator's interest to introduce such a mechanism into insolvency legislation. They point out the lack of provisions that would enable the implementation of the actions in the EU countries (where the property of the debtor or its affiliates is located). The impugned Act enabled the financial restructuring of the Agrokor Group during the Extraordinary Administration Procedure which resulted in settlement and its successful implementation, namely, on 21 August 2019 the Zagreb Commercial Court rendered a decision declaring that the Extraordinary Administration Procedure against 22 affiliated companies of the Agrokor Group was finalized.

Nevertheless, after the enactment and after the "empowerment" by the Constitutional Court, the impugned Act did not remain "immune" to the criticism of the expert public, which continues to this day. The basic complaint remains that it was designed to "rescue" a private company in Croatia and is still judged to be inconsistent with constitutional principles and existing insolvency legislation.[13]

4. Constitutional Court Decision - *Lex Agrokor* – in the service of protection of social, demographic and national security interests?

In the previous part and chapters of this paper/research we have shown that the Act on Extraordinary Administration Procedure in Companies of Systemic Importance for the Republic of Croatia - *Lex Agrokor* has significantly changed the legal system of the Republic of Croatia, which hitherto regulated bankruptcy law, company law and contractual relations, which have been applied in the Croatian legal tradition for years, and introduced new norms governing specific insolvency situations of companies of systemic importance for the Republic of Croatia. In this part of the paper, due to the complexity and now already "historical legislative precedent", the authors proceed from the legal scope, namely the horizontal and

---

decide so and thereby agreed to the legal consequences that will arise for the Agrokor Group due to the opening of the Extraordinary Administration Procedure.

[12] The Constitutional Court took into account the effects of the Extraordinary Administration Procedure over the Agrokor Group, which shows that small suppliers were fully disbursed, while medium and large suppliers have so far been paid onn average 40% of their debt (including trade credit for the refinanced suppliers), respectively 50% of the debt with the included margin debt (Decision, 2018, 54).

[13] Čulinović-Herc, E., Zubović, A., Braut, M., Filipović, T. (2018): *The preventive restructuring of companies in difficulties – one-size-fits-all or tailor made solutions,* Proceedings of the Faculty of Law, University of Rijeka, Vol. 39, No. 4, 1447-1478.

vertical reasons for adopting Lex Agrokor, as well as its effects. Also, in this part of the paper the authors will try to identify the key reasons for adopting the Constitutional Court Deicison No. U-I-1694/2017. et al., dated 2 May 2018, as well as how the effects of the Act are reflected in its indirect dependence/connection on various phenomena affecting contemporary threats to the functioning and survival of each state.

Defining contemporary security threats, threats to national security, and in the present case, searching for the elements of linking the Constitutional Court Decision, No: UI-1694/2017 et al. of 2 May 2018, which established constitutionality and conformity of the impugned Act with the Constitution, as well as the Act with elements influencing security threats of the Republic of Croatia can be seen through:

- the introductory part of the National Security Strategy of the Republic of Croatia of 19 March 2002, which was still in force at the time of the adoption of Lex Agrokor, stating the following: "National security of the Republic of Croatia implies (3) security institutions, related into an orderly system of relationships. The Republic of Croatia seeks to build a state of national security in which its freedom, sovereignty and territorial integrity will be ensured within the framework of internationally accepted arrangements, human freedom and rights of its citizens, political and social stability of society, stable economic development in the conditions of market and enterprise freedom, functioning of the legal states, internal order and personal security of citizens, and healthy and stable environmental conditions." (Croatian National Security Strategy, 2002)

- the text of the introductory part of the National Security Strategy of the Republic of Croatia of 14 July 2017, stating the following: "The National Security Strategy of the Republic of Croatia (hereinafter: the National Security Strategy) is the starting strategic document that defines the policies and instruments for pursuing the vision and national interests and achieving security conditions that will enable balanced and continuous development of the state and society" (National Security Strategy of the Republic of Croatia, 2017).

It is through a contemporary understanding of the national interests of the Republic of Croatia that derive from national strategic documents that one can read the horizontal legal achievements or legal outcomes of the Act and of the Constitutional Court Decision. Such a fact is a reflection of the legislative procedure of adopting the Act, and therefore in the very procedure of its adoption, the reasons why the procedure of the adoption of the Act started, the Government of the Republic of Croatia in the introductory part of the draft Act explicitly identified the aforementioned security threats that could arise if the Act itself does not take enter into force. Also, the primary reasons for the government's legislative activism in terms of adopting the Act in question are reflected in the totality of economic, social and financial stability of the Republic of Croatia, which are the elements that constitute interrelated phenomena that may affect the totality of national security threats. Therefore the Government in the introductory part of the Act on Extraordinary Administration Procedure in Companies of Systemic Importance for the Republic of Croatia – *Lex Agrokor* names the following reasons for adopting the Act: "*In light of the concept of the Republic of Croatia as a state in which entrepreneurial and market freedom are the basis of the economic organization and the Republic of Croatia as a welfare state, the proposed Act regulates the aforementioned issues with respect to the following relevant constitutional principles, guarantees and the highest values of the constitutional order:- responsibility of the state in promoting economic progress and social well-being of citizens and economic development of all its regions - social justice as one of the highest values of the constitutional order .... Its goal is to protect the sustainability of business activities of companies of systemic importance for the Republic of Croatia that, through their business, independently or together with their subsidiaries or affiliates, affect the overall economic, social and financial stability of the Republic of Croatia. Considering that the state is obliged to ensure economic stability and sustainability of public finances, as well*

as to stimulate economic progress and social well-being of citizens and economic development of all regions, the aforementioned objective is completely legitimate .... The measures and rules prescribed by this Act contribute to the realization of a clearly established legitimate aim and form part of the overall public policy measures of the Government of the Republic of Croatia aimed at: social justice, responsibility and solidarity - the rule of law, legal certainty and respect for legitimate expectations"[14]

The quoted Government's explanation/reason for adopting the law in question, which has been forwarded to the Croatian Parliament for further action, clearly depicts the legal complexity of the Act, namely the horizontal legal effect. The importance of aforementioned reasons for adopting the Act in question will affect the adoption of the draft Act by the Croatian Parliament. In the context of establishing the connection between the Act and the Constitutional Court Decision with the elements and principles of social stability of the society-state (welfare state) and the totality of economic prosperity - economic stability, Grubišić Šeba in her research notes the causal relationship and claims the following: "*Agrokor needed to be rescued as soon as possible to prevent a sequence of bankruptcies in the economy. The media especially highlighted tens of thousands of endangered small suppliers - particularly family farms that are threatened by the collapse and insolvency due to the expected insolvency of Agrokor. It was argued that the existing legal solutions that enabled insolvency and pre-insolvency settlement were not effective enough for business groups and that the slowness of their procedures would cause numerous economic consequences such as jeopardizing employment in Agrokor and threatening business continuity and survival of the entire group. It could then be concluded that Agrokor is too big and too important for the economy to fail.*" (Grubišić Š, 2018, pp. 187).

Following this reasoning and the research of determining the causal relationship between the failure to adopt Lex Agrokor and what consequences it would have on the Croatian economy, the loss of jobs, and anything else that would result from this, perhaps is best reflected through the dispersion of stakeholders who have noticed such connection. In addition to the Government's reasons for adopting the Act, the Domestic Policy and National Security Committee of the Croatian Parliament, by its Conclusion of 27 October 2017, requested the Security Intelligence Agency (SOA) to report on the situation in Agrokor and possible consequences related to the possible threat to national security in the Republic of Croatia.[15]

Following the Conclusion of the Domestic Policy and National Security Committee of the Croatian Parliament, the Security Intelligence Agency submitted the Report to the Committee. Since the Report was EUCI classified/closed to the public, the content of the Report as well as the connectivity between the issue of Agrokor as a company of systemic importance for the Republic of Croatia and the threats to national security can be seen in a later Security and Intelligence Agency Report from 2018, which states the following: "*In the past, SOA has given particular attention to supporting the competent state bodies protecting the economic system of the Republic of Croatia, as was the case with Agrokor. SOA, based on its competence in protecting the economic system of the Republic of Croatia and combating economic crime, reported on the circumstances and possible consequences of the Agrokor case on the national security and economic interests of the Republic of Croatia and Agrokor is legally defined as a*

[14] From the point 1 of the Proposal of the Act on Extraordinary Administration Procedure in Companies of Systemic
Importance for the Republic of Croatia. Fundamental issues that need to be regulated by the Act of 31 March 2017 submitted by the Government of the Republic of Croatia to the President of the Croatian Parliament,

[15] Report of the Domestic Policy and National Security Committee discussing Agrokor (2017): ***Possible undermining of the economic Interests of the Republic of Croatia*** of 27 October 2017. More about the report on the website; https://www.sabor.hr/radna-tijela/odbori-i-povjerenstva/izvjesce-odbora-za-unutarnju-politiku-i-nacionalnu- sigurnost-255, (accessed 27 February 2020)

company of systemic importance for the Republic of Croatia... In addition, at the request of the Domestic Policy and National Security Committee of the Croatian Parliament, SOA produced a report on the state of Agrokor and its possible impact on national security." (Security and Intelligence Agency Report, 2018).

How does the totality of economic activities and the economic situation of a country affect the social dimension in the context of achieving social rights and the fulfilment of the provisions of the Constitution of the Republic of Croatia, and in particular, as stated earlier in the paper, the provisions of Article 1, stating that the Republic of Croatia is a welfare state, as well as the provisions of Article 49, paragraph 3, which stipulates that the state promotes economic progress and social well-being of citizens and takes care of the economic development of all its regions, the evidence of the protection of constitutional provisions through the prism of the Act and the Constitutional Court Decision can also be seen through other relevant parameters. Hence the Report of the Croatian Prime Minister M.sc. Andrej Plenković to the Croatian Parliament on the Government's work in the first year of his term shows the actual situation and the consequences that might have happened if the Act had not been adopted. Therefore, the text of the Report states the following: "... The audited financial statements of Agrokor have shown the gravity of the problems that have existed in the company for years. And all this in a company that employs over 58,000 people, 28,000 of them in Croatia[16], and whose income many citizens depend on, and which hence has a systemic impact on the entire Croatian economy. The uncontrolled insolvency and collapse of Agrokor, which was the only realistic possibility at the time, would have unprecedented consequences on our industry, agriculture, tourism, budget, but above all it would impact tens of thousands of businesses related to Agrokor. Konzum's suppliers alone employ more than 149,000 people." (Annual Report of the Croatian Government, 2018).

The information provided on the number of people (in)directly involved in the work of the Agrokor Group, which the Government mentioned in its Annual Report, should be linked to two key points/principles which they undoubtedly influenced or still influence: 1.) the social justice/welfare state principle and the fulfilment of constitutional provisions, referred to in the Constitutional Court Decision, because the preservation of jobs and payment of regular monthly benefits to employees, as well as the fulfilment of obligations towards suppliers by the Group affect the social stability of the society and the fulfilment of social needs of those who are (in)directly related to the Group, while also taking care of the economic stability of the Republic of Croatia; 2.) in the regional context, if we just look at the figures in the three most important combines in Slavonia, Baranja and West Srijem, Belje, PIK Vinkovci and Vupik (presentation of business income, number of employees, average monthly salary (proof: diagrams 1 to 9), we can say that regional development and development of all parts of the Republic of Croatia were also taken care of, which is one of the primary interests in the context of national security protection in accordance with the text of the National Security Strategy of the Republic of Croatia from 2017.

The listed facts on the number of employees and total revenues in the listed companies from the Agrokor Group in the Eastern Croatia clearly depict the importance of the stability of the work and the survival of these companies, which may arise from the Government measure of the Act in question, as well as the Constitutional Court Decision, which regulates the protection of the principles of the welfare state and the economic stability in the Republic of Croatia. From the figures (diagrams) it can be concluded that there were no general negative trends in business and economic "strikes" on business during the crisis in the Group. Also, the diagrams

demonstrate that the Act and the Constitutional Court Decision have further confirmed the stability of business activities of these companies (Belje d.d., PIK Vinkovci d.d., Vupik d.d.). The indicators of business security, regular payments of monthly workers' salaries and job retention can rightly be said to be the initiators of measures of human resources retention in the area of Slavonia and Baranja and West Srijem. In a broader sense, it could ultimately be concluded that the aforementioned indicators of business activity of the companies from the Agrokor Group are simultaneously indicators of demographic measures. Furthermore, confirmation of the thesis of this paper/research, considering the significance of the number of employees of the three companies in the Agrokor Group, the job losses in the companies, as well as the blockage of business at the time of passing the Act in question, can be seen through appeals in the media such as "Slavonia and Baranja will be hurt again", in which the example of Slavonia and Baranja was taken in the context of a possible job threat at the moment of the crisis in the Agrokor Group. Such messages, even if transmitted by "spiritual authority" could undoubtedly have influenced the totality of judgment and were significant in passing the said Act, as well as the Constitutional Court Decision.[17]

This Act is of strategic importance for the totality of economic and social stability of the Republic of Croatia, which is evident in the press statement by the President of the Constitutional Court Miroslav Šeparović; "If the Government did not adopt Lex Agrokor, it would violate the provisions of the Constitution on the welfare state"[18], and in the broad interpretation, we may notice the provisions of strategic documents of the Government of the Republic of Croatia, in particular the Program of the Government of the Republic of Croatia for the term 2016-2020 in the part referring to equal development of all parts of Croatia[19], the provisions of the Regional Development Strategy of the Republic of Croatia for the period up to the end of 2020[20], in the part dealing with the equitable economic development of all parts of the Republic of Croatia, and in particular the National Security Strategy, which states the following: "The Republic of Croatia will create conditions for the dislocation of certain industrial activities from major industrial centres towards less developed and populated areas by policies and measures of stimulating industrial and food production, which will have a positive effect on demographic revitalization and more equitable economic development, and will encourage the maintenance and improvement of agriculture." (National Security Strategy, 2017).

Following the presented strategic documents, and determining the substantive reasons for the adoption of the Act and the Constitutional Court Decision, a clear link is made between reciprocity and dependence between the Act, the Decision and its possible influence in the regional sense, with respect to implementation of the elements of the welfare state, social justice, security, the pursuit of a legitimate aim and the rule of law. Ultimately, all this influences the protection of national security elements that affect the legal, economic and social viability of each country.

[20] "Official Gazette" No. 75/17.

5. Conclusion

In this paper, the authors have considered the decision of the Constitutional Court of the Republic of Croatia in the case called "*Lex Agrokor*". The impugned Act regulates the specific insolvency situations of the companies that are of systemic importance for the Republic of Croatia, and it enabled the financial restructuring of the Agrokor Group. The Constitutional Court divided all the petitioner's complaints into: a) formal agreement complaints and b) formal disagreement complaints and examined them in detail. Despite the fact that the Constitutional Court Decision is subject to numerous objections by the specialised public, we believe that the Constitutional Court issued a very thorough and high-quality solution based on the concept of the welfare state and social justice. The authors of the paper went a step further and analyzed *Lex Agrokor* in the service of protection of social, demographic and national security interests and came to the conclusion that the adoption of *Lex Agrokor* covered development of all parts of the Republic of Croatia, which is one of the primary interests in the context of national security protection, in accordance with the National Security Strategy of the Republic of Croatia from 2017. Stability of business and survival of particular companies such as Belje d.d., PIK Vinkovci d.d., Vupik d.d. is extremely important for the Eastern Croatia, the region most affected by population displacement. Cessation of business of the above companies and the loss of jobs would further cause displacement of the population. Considering the aforementioned, we conclude that *Lex Agrokor* was adopted in the service of protection of social, demographic and national security interests, and the Constitutional Court confirmed and further justified it.

ECONOMIC CONSEQUENCES OF CORRUPTION IN CROATIA

ABSTRACT

The phenomenon of the corruption has been, so far, observed through its penal aspect, although lately more authors researched its effects to certain national economies, but such researches are still insufficient, especially in Croatia. We have conducted our research of the corruption and its economic consequences in Croatia, during last 20 years, under its specific circumstances, in a mature phase of the transition of the Croatian economy. In our article we have set the goal to research the connection and influence of the corruption to the important economic indicators, such as government net lending/borrowing, unemployment, current account balance, etc. Basic hypothesis of the conducted research was that the higher corruption rate in Croatia has worsened the above-mentioned macroeconomic indicators, and that stronger social efforts are necessary in its suppression. Thorough analysis of the available data, their statistic processing and testing of the set basic hypothesis, have brought us to the conclusion that the higher level of the corruption has a negative effect on net lending/borrowing, and at the same time it increases unemployment and negative current account balance, and other macroeconomic indicators. The reform of the institutional form of the suppression of the corruption in Croatia, as well as changes of the legislative frame, have led to certain positive movements in the revealing of the corruptive activities, but it is still significantly present. We can also still notice positive movements on the suppression of the corruption in 5 counties in Slavonia, whereas the most of the corruptive actions were disclosed in Osijek-Baranya and Vukovar-Srijem County. The structure of the disclosed corruptive actions shows insufficient number of submitted reports for bribery, caused by difficulties in obtaining of the relevant evidence. Suppression of the corruption in Croatia is especially important in order to make easier achievement of certain macroeconomic goals.

Key words: *corruption, net lending/borrowing, unemployment, current account balance, GDP per capita.*

1. Introduction

Corruption is without doubt taken as a negative activity, whereas its consequences can be limited, but they also can affect the whole society. Modern definition of the corruption can arise from its dominantly moral, legal, administrative, economic, sociologic or some other conception. For most of the times, corruption is understood as an immoral act through criminal-justice frame, while the perpetrators are punished, as their corruptive activities endanger social moral of the community. However, corruption has multidimensional effects and it is connected to many other social phenomena. Many of contemporary authors research economic phenomenon of the corruption, as well as cause-and-effect relations with other macroeconomic values, such as: level of GDP and its growth rate, inflation, quality of the infrastructure, allocation of the public spending, total investments, direct foreign investments, etc. In countries

with high level of corruption, their citizens have high lack of confidence in the institutions, and at the same time very low or none whatsoever expectation that their civil rights or business activities would be realized in an honest and legal way. In the societies with high level of the corruption, citizens often try to realize their rights by more efficient corruptive means within or outside of the corruptive institutions, whereas they become corrupted themselves. Such an economic system assumes totally distorted economic courses, where significant financial funds are distributed into wrong and socially non-profitable businesses. Moreover, budgets financial funds are spent in a socially unjustified way and needs of the citizens are not satisfied, which increases the price of the necessary services. Highly corruptive countries have mostly lower rate of the economic growth, and above-mentioned occurrences are often correlated. Also, high level of the corruption is, in its basis, contrary to fair business, because market courses are totally diverted and there is no fair market play. Corruption often results in higher stratification of the citizens' standard, decrease of the middle class of the citizens and significant increase of the poverty. In highly corruptive countries there are often higher rates of un-employment and lower rates of employment, emigration of the population in other, more developed countries, etc. Because of everything aforementioned, this research will show that Croatia is not immune to such negative effects of the corruption to certain important macroeconomic indicators.

2. Short overview of the past researches of the influence of the corruption to the economy

One of the contemporary social phenomena that have interested several authors to research its influence to the economy, is definitely „rent-seeking". Baumol (1990) has proved, by using historic sequence of evidence, that „rent-seeking" has a negative influence to the entrepreneurship and economic growth, whereas the structure of the rewarding is directed against production and entrepreneurship. On the other hand, Murpyh et al. (1991) have updated Baumol's research, and came to the conclusion that „rent-seeking" has negative influence to the economic growth. Acemoglu (1995) and Mauro (1995) have also showed that the corruption and „rent-seeking" have influence to movement of certain economic resources towards nonproduction activities, whereas existing income of the „rent-seeking" is protected by corrupted civil servants.

Brumm (1999) has established that „rent-seeking" has a negative influence to the economic growth, by using data on employment, lobbying, for certain federal states of the USA. Barro (1991) have concluded that there is a negative influence of the „rent-seeking" to the economic growth and public expenditure. Cole and Chawdhry (2002), in their researches, used data on the number of registered interest organizations for lobbying in legislative body of a state and density of the interest organization compared to the size of the national economy, whereas they used similar approach to the measurement of the „rent-seeking" as Brumm, and came to the same conclusion, but additionally have concluded that there were indirect negative effects of the „rent-seeking" to public investment and public services. On the other hand, Tanzi and Davoodi (1997), have among other things in their research established that high corruption is connected to high public expenditures of the capital. Bandeira et. al. (2001) have established that the level of the institutional development can affect factor productivity, whereas corruption decreases the productivity of the capital, productivity of the effective human capital and total factor productivity. Several authors have in their researches established negative influence of the corruption to the economic growth, such as Knack and Keefer (1995), Sachs and Warner (1997), Pellegrini and Gerlagh (2004). Aidt et. al. (2008) have concluded that corruption has a strong negative influence on economic growth in the countries with high quality of the institutional system, and vice versa, i.e. economic growth influences reduction of the corruption. Mauro (1995) was researching data of the corruption level height etc. for a total of

68 countries between 1980 and 1983, and concluded that corruption and other factors had negative influence to the investments and economic growth, and especially to the growth of the GDP per capita.

Several authors have established that corruption has a negative influence to the economic growth: Brunetti (1997), Poirson (1998), Li et al. (2000), Mo (2001), Abet and Davoodi (2002), Leite and Weidmann (1999) and Gyimah-Brempong (2002). Meon and Sekkat (2005) have concluded that corruption have significantly negative influence to the growth of the GDP per capita, while interaction of the corruption and bad jurisdiction, as well as interaction of the corruption and government inefficiency have significantly negative influence to the economic growth rate. On the other hand, some authors like Ehrlich and Lui (1999), Kaufmann et al. (1999), Neeman et al. (2004) and Welsch (2004) have concluded that corruption have negative impact to the economic growth. Aizenman and Glick (2003) have calculated, that if the corruption is lowered for one index point, then GDP would increase for 0,5%, while Gyimah-Brempong's calculation have showed growth of 0,39-0,41%. Guetat (2006) was researching determinants of the economic growth in 90 countries in the period of 1960-2000, whereas he especially concentrated on the influence of the corruption through investments and human capital in the countries of Middle East and Northern Africa, and he had established significant negative influence of their respective bad institutional system to the economic growth.

Rock and Bonnett (2004) have established one peculiarity of the newly developed East Asian countries, where economic growth is at a high level despite high levels of corruption. Such occurrence is specially recognized as „East Asian Paradox", and the authors explain its existence by specific patrimonial relations in the sense of protective-clientelist network that exists along with the structure of power between governmental patrons and participants of the civil society. Rose-Ackerman (1978), as well as Becker (1968) have researched corruption of the control, market structure and data. Correlation of the corruption and market structure have been researched, but with different conclusion, by some other authors, such as Bliss and Di Tella (1997), Weinschelbaum (1999), Svensson (1999), Ades and Di Tella (1997, 1999), as well as Laffont and N'Guessan (1999). Shleifer and Vishny (1993), have considered that the corruption has negative influence to the social investments and at the same time to the economic growth and development, which they have particularly analysed at the examples of the transitioning Russia, Philippines and some African countries. The authors have concluded that discretionary dark side of the corruption results in public investments to be diverted from high value projects towards the ones that have no socially useful value. Mauro (1996), Brunetti et al. (1998), Mo (2001), Lambsdorff (2003), Pellegrini and Gerlagh (2004), have concluded that the countries with higher level of corruption have significantly lower investments rate. Campos et al. (1999) have concluded that high level of corruption delays investment, but that such a negative influence after all decreases with higher level of its predictability. Wei (1999), as well as Smarzynska and Wei (2000) have concluded that corruption has the same effect as the tax that discourages direct foreign investments. Authors, such as Abed and Davoodi (2002) have similar conclusion; they have included transitioning countries into their researches, and have considered corruption to significantly decrease direct foreign investments. Nevertheless, some other authors, like Pellegrini and Gerlagh (2004) came to the conclusion in their researches that there was no direct influence of the corruption to the economic growth, i.e. that this influence is indirect. They have considered that corruption has a negative influence to the investment, education, business policy and political stability, which can influence economic growth indirectly. Lambsdorf (1998) has analysed macroeconomic data among several countries and has established that exporters from the countries that have lower level of corruption face problems when importing countries have high level of the corruption.

Rose-Ackerman (1997) has established that corruption on microeconomic level can indeed bring benefits to an economic subject, but at macroeconomic level it creates significant economic loss by creating uneven economic conditions. It is interesting that Alesina and Weder (2002) in their researches have among other things concluded that certain number of corruptive elements have positive relation to the inflow of subventions per capita. Tanzi and Davoodi (2002) have researched influence of the corruption to the quality of the public infrastructure and have established that corruption influences decreasing of the road quality and increases number of cut-outs of the electric power. Friedman et al. (2000) have analysed portion of tax incomes within GDP and have established that corruption influences increasing of the grey economy. Johnson et al. (1997) have similar conclusions when researching 49 Latin America countries, as well as OECD countries and some East Europe countries, and they have established that countries with higher level of corruption have bigger grey economy. Mauro (1998) has concluded that corruption influences reduction of state expenditure for education. Gupta et al. (2001) have established that corruption government tends to increasing of military expenditures. Mo (2001) concluded that countries with higher level of corruption have lower annual average of its citizens' education. It is interesting that such results have not been confirmed by researches of Pellegrini and Gerlagh. Bai and Wei (2000), Dreher and Siemers (2003) have established that corruption influences more limits at the capital account.

Some authors, like Gupta et al. (2002), directed their researches to the influence of the corruption to increasing of poverty in the society and income inequality, i.e. they have concluded that corruption strongly influences income inequality in the society. On the other hand, Foellmi and Oechslin (2003) have considered corruption to influences increasing of the share of the richer part of the society in the total income. However, some other authors, such as Li et al. (2000) have concluded that initial increasing of the income inequality caused by corruption, later can be significantly reduced. Rahmani and Yousefi (2009) have concluded that corruption positively influence the inflation, even when the rate of the growth of the money supply is included in the regression analysis. Al-Marhubi (2000) has established that reducing of the corruption for one point at the same time reduces the logarithm of the average annual inflation for 0,17-0,26%. Abed and Davoodi (2002) have, at an example of the transition countries, have concluded that corruption have positive effect to the inflation, but with realization of the structural reforms, it has no more such positive influence. Honlonkou (2003) has also established in his research that corruption strongly affects changing of the consumers' prices. Bahmani-Oskooee and Nasir (2002) have shown, at a sample of 65 countries, that the higher level of the corruption influences depreciation of the home currency towards foreign ones, which consequently could affect international trade. Piplica (2011) has concluded that corruption has positive influence to the inflation in the transition countries EU members, but that their correlation is of weaker intensity. Nevertheless, by researching correlation of the corruption and economic growth in Croatia and transition countries EU-members, Piplica and Čovo (2011) have established that reduction of the corruption influences increasing of the economic growth.

3. Comprehension and measuring of the corruption

The word corruption has etymological roots in latin „corruptionem", whereas a corrupted person could be someone whose acting results in a certain „failure or some kind of destruction", i.e. such person could be characterized as a „depraved or destructive". However, comprehension of the corruption is not totally without ambiguity, and today there are various evaluations of the term. Definition of the corruption is important for its very comprehension, but also for

pragmatic reasons, in order to enable its adequate reduction, to determine legislative frame, measure its distribution, establish the damage to the society, etc.

However, modern definitions of the corruption are not integral in determining the phenomenon, and they are more or less exposed to some criticism, as they grasp either too little or too much of its comprehension. The Strategy of the Reduction of the Corruption, presented by Croatian National Parliament at the 19th June 2008 session (NN 75/08, dd 01st July 2008), it is stated that „the corruption is harmful social occurrence that damages basic social values.” It is historical, psychological, sociological, economic, political and legal phenomenon. In a larger sense it is every abuse of public authorities for gaining private benefits. In narrower sense, corruption can be defined as an act of prohibited exchange between public servant and some other person, in order to gain personal benefits. It is every act by which, to the contrary of the public interest, without doubt moral and legal norms are breached and basis of the justice are violated. This strategy has had somewhat larger comprehension of the corruption, which is partly understandable, since its narrower comprehension was comprised through separate paragraphs of the Criminal code. In the National programme of the campaign against corruption Croatian ministry of interior, it is stated that „in the largest sense corruption is every form of abuse of public authorities for gaining personal or group benefits, whether it is public or private sector.” In the Article 2. of the Civil Convention of the European Council on corruption (NN 6/03, dd 14th March 2003), it is defined as „asking for, offering, giving or receiving, directly or indirectly, of the bribe or any other illegal benefit or a possibility of gaining such a benefit that violates regular conduction of any duty, or behaviour requested from the receiver of the bribe, illegal benefit or possibility of gaining such benefit.“ We can say that the prevailing comprehension of the corruption is abuse of the public authorities or breaching certain rules for personal benefit.

Considering that the corruption activities are conducted secretly, and very often in one-on-one talks, measuring of the corruption is very difficult, because of its no transparency. Therefore, it is a justified question what model of measuring the corruption could be the most objective and express its real size in a society. Reports against certain persons for corruptive penalties, as well as proceedings and sentences could not be adequate measurement of the distribution of the corruption in a society, because they are mostly related to disclosure activities of the state bodies in corruption reduction. The most common measuring of the corruption in certain social systems are based on the perception of the certain category of the citizens of its distribution. Definitely, the most common is Corruption perception index (CPI), which is in use since 1995, and today is used for measuring corruption worldwide. Index valuates corruption in a country in the range of 0 points, that would mean the most corrupted country, up to 100 points (it used to be up to 10 points, before), that would mean that this is a country without corruption. CPI measures the level of the perception of the corruption related to public servants and politicians, and basis for measuring are perceptions, researches and estimations through polls with questions relate to bribing of the public servants, corruption in public procurement, embezzlement of public funds, etc. It also researches determination and efficiency of certain state bodies and social community in reduction of the corruption. The problems in using this index can arise because of non-standardized system of points from every source, so certain procedures of standardization are implemented, by using certain technics. In using the mentioned index Transparency International uses several researches and estimations of different institutions, such as African Development Bank, Bertelsmann Foundation, Economist Intelligence Unit, Freedom House, Global Insight, International Institute for Management Development, Political and Economic Risk Consultancy, The PRS Group, Inc., World Economic Forum, World Bank, World Justice Project i etc. Considering the aforesaid, we will use CPI in our research as the most suitable

index for measuring the corruption. Apart from CPI, today there is also Global Corruption Barometer (GCB), which is also used by Transparency International, which measures the size of the corruption by using direct public opinion research. Furthermore, in its activity, Transparency International uses also Index of readiness to receive bribe, which establishes readiness of certain companies in a country to accept corruptive business practises, where entrepreneurs in a country comment corruptive business action.

4. The impact of corruption on certain macroeconomic indicators in Croatia

In our research for measuring corruption in Croatia, we will use Corruption perception index, and we will put it into correlation with 5 macroeconomic values, as follows: Current account balance, General government net lending/borrowing, GDP per capita, Inflation and Unemployment rate. Our research of the influence of the corruption to certain macroeconomic values was made for the period of 1999 – 2018, when Croatia has entered more mature period of its transition. Previous data for the corruption level were not available, since Transparency International did not publish data for the period. These data let us look at table no. 1.

Table 1: Corruption and certain macroeconomic indicators in Croatia, 1999-2018

A	B	C	D	E	F	G
1999	27	-6,4	-7,2	54431	3,8	18,6
2000	37	-2,2	-5,6	58701	5,4	20,6
2001	39	-2,9	-5,9	61800	2,5	21,5
2002	38	-7,1	-3,5	65047	1,8	21,8
2003	37	-5,9	-4,7	68661	1,7	19,1
2004	35	-4,1	-5,2	69211	2,8	17,8
2005	34	-5,2	-3,9	72007	3,6	17,6
2006	34	-6,5	-3,4	75546	2,1	16,5
2007	41	-7,1	-2,4	79609	5,8	14,7
2008	44	-8,8	-2,8	81266	2,9	13,0
2009	41	-5,1	-6,0	75426	1,9	14,5
2010	41	-1,1	-6,3	74500	1,8	17,2
2011	40	-0,7	-7,9	76622	2,1	17,4
2012	46	-0,1	-5,3	75088	4,6	18,6
2013	48	0,9	-5,3	74930	0,3	19,8
2014	48	2,0	-5,1	75182	-0,5	19,3
2015	51	4,6	-3,2	77609	-0,6	17,1
2016	49	2,5	-1,0	80931	0,2	15,0
2017	49	3,5	0,8	84285	1,2	12,4
2018	48	2,5	0,2	87263	0,9	9,9

A -Year, B – Corruption CPI, C – Current account balance /Percent of GDP, D - General government net lending/borrowing, Percent of GDP, E - GDP per capita, constant prices National currency (kuna), F - Inflation, end of period, consumer price, G - Unemployment rate Percent of total labour force

Source: Transparency International, WEO data

Average value of the corruption in the observed period of 1999-2018, calculated by CPI method, amounts 41,35, which means that average level of the corruption in Croatia is not satisfactory in comparison to the other countries EU members. Variation coefficient amount 15,52, so we can consider that the distribution is relatively homogeneous. It is also obvious that average Current account balance/Percent of GDP amounts -2,63%, which is especially negatively affected by unfavourable balance of trade. Average deviation of the average for

Current account balance/Percent of GDP amounts 4,1067. The worst ration of the indicator was in 2008, -8,8%, but last years it has fairly improved and in 2015 it amounted 4,6%. Furthermore, average General government net lending/borrowing, percent of GDP amounts 4,18%. Average GDP per capita, constant prices amounts 73405,75 kunas, which puts Croatia at the bottom of the scale of EU countries. The lowest GDP per capita was in 1999, and it amounted 54431 kunas, and the highest was in 2018, and it amounted 87263 kunas. It is an increase of about 60%, which is not enough for the period of 20 years. Average inflation rate is 2,21% which can be considered satisfactory and it fulfils Maastricht criteria. Average rate of unemployment percent of total labour force amounts 17,12% and it is definitely not satisfactory. However, in recent years the mentioned rate has been significantly reduced, but partly due to migration of young work force from Croatia. The regression results of our study are presented in table no. 2.

Source: Author´s calculation

Corruption correlation coefficient measured by the perception corruption index and general government net lending/borrowing as a percent of GDP was positive and it amounted 0,510, which means that they are largely correlated. Efficient actions in reducing the level of the corruption in Croatia has resulted in positive influence on the rate of general government net lending/borrowing. If we consider standard error of estimate of 2,0433, we can conclude that its level signifies similar trend of the correlation of the corruption and general government net lending/borrowing in near future. Positive ration of this indicator in 2017 and 2018 contributes to macroeconomic stability of Croatia. The correlation between corruption and general government net lending / borrowing in Croatia is clear from graph no. 1.

Graph 1: Corruption and General government net lending/borrowing in Croatia 1999-2018

Corruption and General government net lending/borrowing
Percent of GDP
$Y = 47,2722 + 1,4151 \cdot x$
Source: Author's calculation

Furthermore, it is also obvious that reducing of the corruption level has a negative effect to the level of the unemployment rate, but this correlation is weak. It is possible that such an influence would be higher, if some other factors, like migrating of work force abroad, would not influence the level of unemployment. Similar trend of the mentioned ration is to be expected in near future as well. The relationship between corruption and unemployment is obvious in graph no. 2.

Graph 2: Corruption and Unemployment rate/percent of total labour force in Croatia 1999-2018

Corruption and Unemployment rate / Percent of total labor force
$Y = 54,9139 - 0,7923 \cdot x$
Source: Author's calculation

Reducing corruption has a strong impact on improving the current account balance, so their correlation is high at 0,754. In the period of 2013-2019 Croatia have had surplus of current account balance, arising mainly from increased incomes from tourism and growth of private remittances from abroad, despite lower Croatian international trade. Although the appropriate economy policy measures stimulating the export, always make effect to the international trade, the low corruption in the country also influences the foreign economy subjects to participate in international trade with Croatia. Therefore, the effective suppressing of corruption proves to be important precondition for normal international trade. The positive relationship between CPI and the current account balance is visible in graph no. 3.

Graph 3: Corruption and Current account balance /percent of GDP in Croatia 1999-2018

Corruption and Current account balance / Percent of GDP
Y = 44,132+1,1788*x
Source: Author´s calculation

Our research proved also that the lower corruption level in Croatia (higher CPI) has relatively strong influence on lowering the inflation as well (let's look at graph no. 4), where the correlation coefficient is negative and amounts -0,57. For the calculation, as a measure of inflation, consumer price index was used for end of period 2014 and 2015. Croatia had even negative inflation rate what, of course, was not good for macroeconomic stability of the country. During the researched period Croatian Central Bank in its monetary policy realized the stability of prices as its main aim. Nevertheless, by the research carried out we have shown that it is not only monetary manipulation that influences the inflation, but also some other phenomena like corruption, what can accelerate or obstruct the implementation of healthy monetary policy.

Graph 4: Corruption and Inflation in Croatia 1999-2018

Corruption and Inflation
Y= 45,9064-2,0571*x
Source: Author´s calculation

Furthermore, lower corruption level (higher CPI) is strongly positively correlated to the growth of GDP per capita, where the stated correlation coefficient in the researched period was 0,733. Although Croatian GDP per capita should have to grow up stronger as to get connected to the average one of EU, it is of high importance the corruption level to be lowered in order to enable the most capable economic subjects and the highest quality employees to realize their abilities on a fair play market. It is to be expected the similar trend of corruption and GDP correlation per capita in the future, what means that the Governmental Bodies competent for corruption suppression, as well as the public, should pay additional efforts to suppress the corruption as

one of preconditions for the growth of Croatian citizens' welfare. Let's look at the relationship between corruption and GDP per capita in Croatia in graph no. 5.

Graph 5: Corruption and GDP per capita in Croatia 1999-2018

5. Suppression of corruption in Croatia

Economic reforms and the transition to the market economy after independency of the Republic of Croatia, required the crucial changes in suppression of corruption activities which got different appearance forms. The transition of social to private ownership rendered the opportunity of unlawful acquiring of immense wealth and the possibility of managing the financial courses of great number of companies. Inefficiency of penalty persecution of corruptive penalty actors resulted with the need for reforms of governmental bodies competent for crime persecution. Therefore, the Ministry of Internal Affairs, State Attorney's Office and Courts, Tax and Customs Authorities and others, had to realize the inevitable organizational and personnel reforms. In the course of realizing the reforms of Governmental Bodies it was not rare that there happened certain organizational inconsistences, improper distinguishing of the respective competences of the Governmental Bodies, lack of criteria for positioning of head persons in the said bodies, etc.

Certain step ahead in combatting the corruption was made by making National program for combating corruption and Plan of action for combating corruption (National Gazette 34/02), what resulted in establishing State Prosecutor's Office for the Suppression of Organized Crime and Corruption (USKOK) as a body attached to the State's Attorney Office, situated in regional centres of Zagreb, Split, Rijeka and Osijek. Establishing of new organisational bodies attached to State's Attorney Office, Police, Tax Authority etc. strictly specialized for prosecuting corruption crime actors or for respective support to such prosecution, the investigation of bigger corruptive scandals took place, what resulted in processing high governmental officials, where the damages caused was measured in tens of millions Euros.

The Criminal Law retained the conception of corruptive crimes like receiving the bribe, giving the bribe, abuse of one's position and authority, abuse of one's authority in doing economy transactions (business), and similar, but new crimes have been also established like hiding of illegally acquired money, abuse of authority in bankruptcy procedure, abuse of authority in public services etc, which were more appropriate to the illegal activities in market economy. Particularly important changes have been made in Crime Process Law which provided for certain authorities and legal means for more efficient prosecution of corruptive crime actors. State Prosecutor's Office got in its competency the investigational actions which were in investigating judge's competence so far. The whole legislative frame is updated by more laws such as the Law on State Prosecutor's Office for the suppression of Corruption and Organized Crime, Law on responsibility of legal entities for criminal acts, Law on protection of witnesses, Law on preventing of Money Laundering, Law on the procedure of depriving of property benefits resulted from a crime or violation, Law on International legal help in Criminal matters, Law on right to approach to information and others. Furthermore, Croatia accepted the Penalty law Convention on Corruption, the Civil Law Convention on Corruption as well as the UN Convention on Corruption. Despite to certain improvements in corruption suppression in Croatia, evidently corruption is still high, what can be proven through Croatian citizens' perception on its broadness. Certain awareness on suppression of corruption are evident from the list of reported corruptive crimes within last ten years. This is just the period, since which the specialised Governmental bodies on suppression of corruption have started their respective activities, as USKOK and PNUSKOK. Let's look at the statistics of corruption offenses in Croatia in table number 4.

Table 4: Corruption crime in Croatia in the period 2008 – 2018

Source Ministry of Interior, statistic bulletin

Explanation A-Years, B – reported economy crimes in Croatia, C - corruption crimes reported in Croatia, D – entering into harmful contract, E – receiving and giving the bribe in bankruptcy process, H – Abuse of position and authority – done by officials, I – abuse of performing governmental service, J – illegal favouring, K – illegal intermediation, L – receiving bribe, M – giving bribe, N – revealing of official (classified) secret, O – trading of influence, P – giving bribe for influence trading.

It is obvious that positive movement of Croatia on the scale of measuring the corruption is slow. According to Transparency International CPI, in 1999. Croatia was on 74 position in the world, in 2005 it was on 70 position of the rank, while in 2008 on 62, and in 2015 Croatia came on 50 position. But then certain backward movement happened, so that in 2016 Croatia takes 55 position, in 2017 is on 57 position and in 2018 on 60 position.

Analysing the reported corruption crimes, the greatest part of them refers to abuse of the position and authority. Corruption actors usually leave some traces in the respective business documentation and elsewhere, what helps in their revealing. Some forms of such crimes may be very sophisticated what supposes a detailed analysis and comparing of different business documentation, while the others are simpler and very often prove arrogancy of a person that got opportunity to serve on a responsible public duty. It appears that in 2014. among 920 reported corruption crimes even 758 referred to abuse of the position and authority, what means even 82,4 percent; in 2015. among 759 reported corruption crimes 674 was of the same kind, or 88,8 percent and among 515 as reported corruption crimes in 2018, it was even 470 due to abuse of the position and authority, i.e. 91,3 percent. At the same time such data show how difficult the corruptive crimes can be revealed as they happen in one-to-one action, not being documented. Just due to it „real" corruptive crimes such as receiving the bribe and giving the bribe are less in number. Nevertheless, in the period between 2011 and 2013 there is higher number of such crimes reported, among which, in 2013 there are even 455crimes of receiving the bribe and 522 giving the bribe, what means 977 reported crimes, what represents higher number than 890 reported crimes the same year of abuse of the position and authority. Bigger number of the reported crimes of receiving and giving the bribe followed as a consequence of a wide activity on undertaking and accomplishing of anti-corruption processes relative to the higher number of actors. This fact should be taken with certain reserve because very often when reporting the crime of giving the bribe, the receiver of the bribe is already known, who is then reported for the crime of receiving the bribe. USKOK has rejected great number of such crimes reported by the citizens caused by their dissatisfaction with the system activity, while the reports given by PNUSKOK as a specialized operational body for prosecution of such crimes are rejected in significantly lower number. Let's look at the graph of corruption offenses in 3 Slavonian counties.

Graph 6: Corruption in Croatia, Osijek-Baranya and Vukovar - Srijem counties

Corruptive Offenses

- Corruptive Offenses in Croatia
- Corruptive Offenses in Osijek-Baranya County
- Corruptive Offenses in Vukovar-Srijem County
Source: Ministry of Interior

In 2018 in five Slavonian counties there have been reported only 5,6% corruptive crimes, in 2017 have been reported 24,6% and in 2016 have been reported 36,2%. The largest part of the prosecutive activities of the corruptive crimes were in Osijek-Baranya and Vukovar-Srijem Counties. Prosecutive activities of the corruptive crimes in the two afore mentioned counties were especially large in the period of 2014-2016. Namely, in 2014 it amounted 30,76% of all the disclosed corruptive crimes in Croatia, and in 2015 it has increased to 34,26% of all the disclosed corruptive crimes in Croatia, while in 2016 it has been 30,39% of the total in Croatia. When we consider that Osijek-Baranya and Vukovar-Srijem Counties together participate in less than 8% in the total GDP of the Croatia, than such a suppression of the corruption is very significant. At the same time, it means that the corruption suppression in some other counties is by far of weaker intensity. The reason for the increased number of the prosecuting activities lays in the realization of the undertaken anti-corruption actions of the state bodies, where such actions comprised higher number of the corruptive crimes. It is obvious that the larger number of the reported corruptive penalties related to the corruption of the position and authority, whereas the actors of such deeds leave traces in business documents, which facilitates their disclosure. It is important to emphasize that such actions do not comprise only the participants of the so called „street-corruption" but also certain persons that are higher in the social scale. However, it is worrying that in 2018 the number of disclosed corruptive penalties in Osijek-Baranya and Vukovar-Srijem Counties counted only 0,3% of all the disclosed corruptive crimes in Croatia, which is a significant fall down of prosecuting activities of all the services in charge of prosecuting corruptive crimes.

6. Conclusion

Economic consequences of the corruption are becoming a matter of researches of many authors. Transition of the Croatian economy from socialistic economy to modern market economy has opened an opportunity for certain persons to gain significant personal wealth through corruptive actions and to the loss of most of the Croatian citizens. Our research has proven that suppression of the corruption has not only important moral dimension, but that corruption is at the same time, more or less, significantly correlated with certain important macroeconomic indicators. By our research we have confirmed our basic hypothesis that, during 20 years of the more mature phase of the transition in Croatia, lower level of the corruption had relatively strong

positive effect to general government net lending/borrowing, and negative to the unemployment rate, but this effect was weaker. We have also confirmed hypothesis that lower level of the corruption is correlated with lower level of the inflation, where this correlation was significant. The confirmation of our basic hypothesis was particularly obvious in realizing that the lower level of the corruption is most strongly positively correlated to surplus in current account balance, as well as the growth of GDP per capita of the Croatian citizens.

We have established that, during the observed period, the reform of the institutional form and changes of the legislative determinants have brought some positive movements in suppression of the corruption in Croatia, however not nearly enough, which reflects in citizens' perception of the extent of the corruption's distribution. According to the structure of the disclosed corruptive crimes, positive movements in suppression of the corruption in Slavonia are mostly visible in Osijek-Baranya and Vukovar-Srijem Counties. Although a certain improvement in disclosing crimes of giving and receiving bribe has been achieved, it is significantly limited by the difficulties in obtaining of the proper evidence. The suppression of the corruption in Croatia is therefore especially important in order to gain certain macroeconomic goals and improve efficiency of the applied instruments of the economic policy.

DETERMINANTS OF FIRM PROFITABILITY IN EASTERN CROATIA[1]

ABSTRACT

The aim of this paper is to analyze the determinants of firm profitability in Eastern Croatia (namely County of Virovitica-Podravina, County of Požega-Slavonia, County of Brod-Posavina, County of Osijek-Baranja, and County of Vukovar-Srijem) and to determine if they differ significantly from firm profitability determinants in the rest of Croatia. In the analysis data from the Amadeus database on medium, large, and very large active companies is used, in the biggest four sectors of activity in Eastern Croatia: agriculture (A), manufacturing(C), construction (F), and trade (G). After statistical rejection of lagged profits as determinants of current profits, a fixed effects model using Driscoll-Kraay standard errors is applied, and positive effects of market share (in sectors C and G), labor productivity (C and G), capital productivity (C and G), liquidity (C and G), export intensity (C) and negative effects of insolvency (C and G), indebtedness (G), export intensity (G), capital intensity (C and G), taxes (A and G) and labor costs (C and G) are found. The analysis also shows that when comparing Eastern Croatia to the rest of the country, there is significantly greater positive impact of export intensity (in sectors A and C) and labor productivity (G) in Eastern Croatia. On the other hand, there is significantly greater negative impact of taxes (A and G) and export intensity (G), but also a less negative impact of labor costs (C and G) and insolvency (G) in Eastern Croatia compared to the rest of the country. The analysis revealed no robust statistically significant profitability determinants for the construction sector and also no robust differences in profitability determinants of this sector. These results offer clear directions for assisting development of Eastern Croatian entrepreneurship, both in general and sector-specific.

Key words: *firm profitability, eastern Croatia, fixed effects.*

1. Introduction

The region of Eastern Croatia encompasses five Croatian counties, namely Virovitica-Podravina, Požega-Slavonia, Brod-Posavina, Osijek-Baranja, and Vukovar-Srijem County

---

(Tax Administration, 2019). The Eastern Croatia distinguishes itself economically from the other parts of Croatia in many aspects, making it an interesting and important area to study. Namely, in 2018 development index and economic indicators of Eastern Croatia were below the Croatian average. Consequently, it has extremely high risk of poverty (Marošević, 2018). According to the Croatian Bureau of Statistics (2011) poverty risk rate measured using the expenditure method in Croatia equals 17.1%. The lowest rates of poverty risk are recorded in Zagreb (5.9%), and the highest in Brod-Posavina County (33.9%). In all five counties of Eastern Croatia risk of poverty is over 30%. The Croatian government recognizes this problem and states that Eastern Croatia should intensify efforts to fight poverty and social exclusion (Vlada RH, 2020). This high risk of poverty is related to the fact that its regional index of competitiveness is below the Croatian average. Apart from Osijek-Baranja County, all the other Eastern Croatian counties occupy the bottom positions. Vukovar-Srijem County has the lowest quality of the business environment (which includes demographics, health and culture, education, basic infrastructure and the public sector indicators) and Brod-Posavina County the lowest quality of the business sector (which includes investment and entrepreneurial dynamics, entrepreneurship development and economic results) (Slipčević, Dikonić, Lakoš, 2019). Eastern Croatia is also characterized by the lowest level of entrepreneurial activity and the lowest motivational index, which includes perception of opportunities and intentions of launching a business venture (Slipčević, Dikonić, Lakoš, 2019). Kovačević, Kovačević and Kršul (2014) find that the entrepreneurs from that region generate the lowest revenue and profit of all Croatian regions, and with the exception of Osijek-Baranja County, other counties of Eastern Croatia are entrepreneurially underdeveloped. Finally, this area is characterized by the lowest level of political accountability and the lowest budget outcomes (Ott, Mačkić, Prijaković, 2019).

Having in mind this entrepreneurial underdevelopment of Eastern Croatia, questions arise – what are the determinants of profitability of Eastern Croatian companies and do they differ significantly from the profitability determinants in the rest of Croatia? These are the questions that this paper aims to answer.

The determinants of Croatian companies' profitability have been studied so far for the small and medium sized companies (SMEs) (Harc, 2014), for the companies listed at the Zagreb Stock Exchange (Pervan, Pervan and Todorić, 2012) and for the companies of the different sectors of activity: manufacturing sector (Škuflić, Mlinarić and Družić (2016), Anić, Rajh and Teodorović (2009), Pervan and Višić (2012), Pervan, Pervan and Ćurak (2019)), food and beverage manufacturing sector (Pervan, Pervan andĆurak (2017), Pervan and Mlikota (2013), Muminović and AljinovićBarać (2015)), construction sector (Škuflić, Mlinarić and Družić, 2018), insurance sector (PavićKramarić, Miletić and Pavić, 2017), banking sector (Pervan, Pelivan and Arnerić, 2015), hotel companies (Dimitrić, Tomas Živković and ArbulaBlechich (2019), Škuflić and Mlinarić (2015)) and software companies (Korent and Orsag, 2018). However, the analysis of the regional specifics of firm profitability in Croatia has been scarce and only partial. Letinić, Budimir and Župan (2019) analyze the correlation between profitability and the tax breaks in the area of special national status from 2005 to 2013 and find a positive relationship. Kovačević, Kovačević and Kršul (2014) analyze profitability in Eastern Croatia and other Croatian regions using correlation coefficients and find negative correlation between profitability and share of total debt in total assets, share of short-term debt in total assets and the share of debt in capital structure. This paper, on the other hand, conducts a comprehensive empirical panel analysis of the profitability determinants of Eastern Croatian companies from 2008 to 2017, and statistically tests the hypothesis that there is no difference between these profitability determinants in Eastern Croatia compared to the rest of the country. Additionally, the analysis is conducted for the four most important sectors of activity in Eastern Croatia, namely agriculture (A), manufacturing (C), construction (F), and trade (G). The results

of this comprehensive analysis bridge the gap in the existing empirical literature and offer insights for the economic policy.

The paper is organized as follows. First, a brief theoretical background and explanation of the most commonly assumed determinants of firm profitability is provided. Next, an explanation is provided of the data and methodology used in the paper. This is followed by the empirical analysis and the results. The last section concludes.

2. Theoretical background and variables

Identifying the determinants of firm profitability is an important theme in economics, strategic management, accounting and finance research and their approaches to the subject differ. For example, the industrial economics focuses on industry characteristics that determine profitability, such as concentration, economies of scale and entry and exit barriers (Bain, 1956; Slater and Olson, 2002). Within it, the persistence of profit approach focuses on the time-series behavior of profitability. The strategic management approach, on the other hand, views internal resources specific to the firm as determinants of profitability (Teece, 1981; Barney, 1991, 2001). Resource-based view states that organizational structures and management practices are the main determinants. Internal resources, which can be tangible (financial and physical factors of production) or intangible (technology, reputation, architecture), reflect the firm's core and distinctive capabilities (Prahalad and Hamel, 1990). The accounting and finance approach represents a separate but related strand of research concerning the usefulness of the random walk model as a descriptor of time series movements in profitability. Little (1962), Little and Rayner (1966), Ball and Watts (1972), Watts and Leftwich (1977), Callen et al. (1993) and Chan et al. (2003) present evidence in support of the random walk hypothesis. Other studies (Lev(1983), Penman (1991), Lipe and Kormendi (1994), Callen(2001)), which analyze profitability measures such as return on equity (ROE), assets or sales, report findings similar to those of the persistence of profit literature in industrial economics: there is serial correlation in profit rates, which tend to converge towards firm-specific long run average values (Goddard, Tavakoli and Wilson, 2005).

Škuflić and Mlinarić (2015) divide all of the firm profitability determinants into global (such as global trends on commodity, input and output markets), national (e.g. the economic growth, domestic demand, education, labor and financial market characteristics, tax system, infrastructure and institutions, exchange rate, etc.), industry-level (e.g. industry size, market concentration, barriers to entry, strategic interconnectedness, mergers and acquisitions, etc.) and firm-level determinants (size, productivity, previous year's profits, liquidity, solvency, leverage, research, investment, etc.). This classification regarding industry-level and firm-level determinants is followed throughout this paper.

3. Data and methodology

3.1. Data

In the empirical analysis the data from Amadeus database on 9108 medium, large, and very large active companies is used, in the biggest four sectors of activity in Croatia: agriculture (A), manufacturing(C), construction (F), and trade (G). Amadeus classifies companies based on size by the following criteria. A firm is considered to be "very large" if it satisfies one of the following criteria: operating revenue above 100 mil EUR, total assets above 200 mil EUR, or more than 1000 employees. "Large" firms criteria are: operating revenue above 10 mil EUR, total assets above 20 mil EUR or more than 150 employees. And finally, "medium" firms' criteria are: operating revenue above 1 mil EUR, total assets above 2 mil EUR, or more than 15

employees. The period of analysis is from 2008 to 2017. The variables used in the analysis were constructed from basic variables available in the Amadeus database, and are presented in Table 1 together with the calculation method used to obtain them. The last column shows the papers that used the listed variables in their firm profitability analysis on Croatian data. Independent variables from Table 1 are additionally modified by multiplying them with a dummy variable which takes the value 1 if the firm operates in East Croatia, and 0 otherwise. Those variables are listed with a suffix „_east".

Table 1: Description of variables

Variable name	Symbol	Calculation method/source	Croatian literature
EBITDA margin	EBITDA_m	(EBITDA/turnover)*100	Pervan, Pervan and Ćurak (2017), Pervan and Višić (2012)
Profit margin	Profit_m	(Profit/turnover)*100;	Pervan and Višić (2012)
Return on assets	ROA	Net profit before tax plus interest (EBIT)/total assets;	Anić, Rajh and Teodorović (2009), Korent and Orsag (2018), Muminović and AljinovićBarać (2015), PavićKramarić, Miletić and Pavić (2017), Pervan, Pelivan and Arnerić, (2015), Pervan, Pervan and Ćurak (2019), Pervan, Pervan and Todorić (2012), Pervan and Višić (2012),
Market share	market_share2ln	Natural logarithm of company's market power defined as the percentage of its turnoverin totalindustry turnover;	Korent and Orsag (2018)
Labor productivity	productivity1ln	Natural logarithm of the ratio of turnover to employment;	Dimitrić, Tomas Živković and ArbulaBlechich (2019)
Capital productivity	c_productivityln	Natural logarithm of the ratio of turnover to capital;	-
Liquidity	liquidityln	Natural logarithm of [(current assets-stock)/current liabilities];	Pervan, Pervan and Ćurak (2017)
Solvency	debt_ratio100	Total debt/total assets;	Anić, Rajh and Teodorović (2009), Pervan and Višić (2012)
Indebtedness	debt_m2	Debt/EBITDA;	Škuflić, Mlinarić and Družić (2016)
Growth of company	firm_growth	Annual changes in revenue - operating turnover percentage change;	Korent and Orsag (2018)
Export intensity	export_intensity2ln	Ratio of export to sales;	Anić, Rajh and Teodorović (2009)
Capital intensity	capital_intensity1ln	Fixed assets per employee;	Anić, Rajh and Teodorović (2009)
Taxes	e_tax1	Tax/Profit;	-
Labor cost	labor_costln	(Employees cost/turnover)*100;	Pervan, Pervan and Ćurak (2019)

Source: Authors

EBITDA margin, profit margin and return on assets (ROA) are in the analysis used as dependent variables, i.e. indicators of firm profitability. The rest of the variables from Table 1 are explanatory variables, assumed to impact firm profitability.

Most of the independent variables are self-explanatory, however in the case of "market share" two problems arose which warrant further elaboration. First, it is necessary to define what is meant by "industry". Here, the approach of Goddard, Tavakoli and Wilson (2005) is followed who define an industry by its two-digit NACE rev.2 classification. The second problem is more nuanced, and has to do with data quality. The Amadeus database is constructed in such a way so that every firm in the database in our 10year timeframe (2008-2017) is represented in each year regardless of how many years it was active. In the case that the firm did not yet exist (or closed) during this period its values are reported as missing. In addition, there are some gaps in the database, where key variables (such as turnover or number of employees) are not reported in certain years (even in some cases for very large firms), and are therefore also reported as missing. These two facts constitute a problem for market share calculations, since it becomes a non-trivial problem to determine whether a firm in a given year has not yet begun/ceased to exist, or alternatively is simply missing data for that year. By taking samples of the data it was determined that cases exist where very large firms have instances of missing data, which result in extreme variations of market share values in corresponding industries. To address this problem an additional turnover variable was created in which all missing data was filled with the closest available values, and then used to calculate market share values. This came at a cost however, in the form of ignoring the fact that some firms might not have existed or closed down during the analyzed period. It was felt that this is the "lesser of the two evils", since market share values are less likely to be significantly affected by firm entry and exit (which in a ten year timeframe is predominantly small firm behavior) than by missing values of key market players in certain years.

As far as the expected coefficient signs of independent variables are concerned, they are relatively straightforward. Market share is expected to be positively correlated with firm profitability, since firms with market power tend to have anti-competitive strategies that enable them to earn abnormal profit. Alternatively, firms with a large market share may have acquired it by being more innovative or efficient in the past (Goddard, Tavakoli and Wilson, 2005). Firm growth and market share can be considered to be somewhat linked, as both measure a firms "staying power", i.e. the degree to which a firm has adapted to the market successfully. Additionally, the size of market share is expected to be especially relevant in this case, since three out of the four analyzed industries (agriculture, manufacturing, and construction) traditionally exhibit strong economies of scale.

Labor and capital productivity constitute productivity measures, both of which are expected to have a positive impact on profitability. Similar measures include capital intensity, which under the assumption that more capital per worker implies higher worker productivity is also expected to have a positive impact on our dependent variables. In some sense it can be argued that the "labor cost" variable constitutes the opposite of labor productivity, measuring how much is spent on labor for every additional unit of turnover, which means the expected coefficient sign is negative.

Solvency and indebtedness are closely tied together as measures of how much the firm is saddled with debt, the amount of debt usually being negatively correlated with profitability. On the other hand, liquidity captures a similar concept but the other way around: the ratio of assets to liabilities which is expected to have a positive impact on profitability the higher it goes, as a proxy measure of less indebtedness. Namely, liquidity indicates the speed at which a firm can react to sudden changes in its environment and holding a high proportion of assets in liquid form makes it less exposed to risk. However, a too high proportion of assets in liquid form may constrain its ability to exploit profitable long-term investment opportunities (Goddard, Tavakoli and Wilson, 2005).

The "etax1" variable is designed to capture the amount of tax burden in the economy, which is expected to have a negative impact on profitability due to overly burdened and complex Croatian tax system.

The final independent variable is export intensity. Generally, some evidence suggests that export intensity is an important driver of firms' performance since it may help firms improve the utilization of production capacity, develop superior management capabilities and enhance innovation in products and processes (Anić, Rajh and Teodorović, 2009),

3.2. Methodology

As the data consists of few time periods (10 years, from 2008 to 2017) and many individuals (9108 firms), it is a short panel. Considering that most authors (Goddard, Tavakoli and Wilson (2005), Škuflić, Mlinarić and Družić (2016), Škuflić, Mlinarić and Družić (2018), Pervan, Pervan and Todorić (2012), Pervan, Pervan, Ćurak (2017), Škuflić and Mlinarić (2015), Pervan, Pervan and Ćurak (2019), Dimitrić, Tomas Živković and Arbula Blechich (2019), etc.) have found dynamic relationship between firm profitability measures and their determinants, a dynamic analysis is conducted in this paper. Arellano–Bond (Arellano and Bond 1991) and Arellano–Bover/Blundell–Bond (Arellano and Bover 1995; Blundell and Bond 1998) dynamic panel estimators are appropriate for situations with few time periods and many individuals; a linear functional relationship; dynamic dependent variable; independent variables that are not strictly exogenous; fixed individual effects; and heteroskedasticity and autocorrelation within individuals but not across them (Roodman, 2009). Since the Sargan statistic is not robust to heteroskedasticity or autocorrelation, Hansen (1982) J statistic is used, which is the minimized value of the two-step generalized method of moments criterion function, and is robust. Hansen test did not confirm the validity of instruments used in the analysis[2]. Therefore, a static panel model was applied in this paper.

In microeconometric analysis of panel data there are two basic models, fixed effects (FE), and random effects (RE) (Cameron and Trivedi, 2010). The decision between FE and RE in this paper is based upon the results of the Hausman test and modified Hausman test (Hausman, 1978; Hoechle, 2007). The results of these tests confirm the use of FE model (which corresponds to some empirical literature on firm profitability in Croatia such as Pervan and Višić (2012)).

The FE model equation (1) is shown below:

$$Y_{it} = \beta_k X_{it} + \alpha_i + u_{it} \tag{1}$$

where α_i is the constant term for every group, Y_{it} the vector of dependent variables in time t, and group i, X_{it} vector of independent variables, and u_{it} is the error term. Driscoll and Kraay (1998) standard errors are used since they are robust to general forms of cross-sectional dependence, but also autocorrelation and heteroskedasticity.

4. Empirical analysis

A unit root test is conducted for all variables in the analysis on a balanced panel subsample and indicated stationarity of all variables. On the grounds of the (modified) Hausman test results, it

---

[2]Results available on request.

was decided to conduct a panel model with fixed effects.[3] The analysis is divided into two parts. First, the determinants of firm profitability in Eastern Croatia are analyzed on the subsample of only Eastern Croatian firms. Second, the hypothesis that the profitability determinants in Eastern Croatia do not differ significantly from the profitability determinants in the rest of the Croatia is tested. This second part of the analysis is conducted on the full sample of all Croatian firms in the four analyzed sectors.

4.1. Profitability determinants in Eastern Croatia

Firm profitability determinants in Eastern Croatia are first analyzed for the four biggest sectors in Eastern Croatia jointly. Next, specific sectors are analyzed individually, namely sectors A (agriculture), C (manufacturing), G (construction), and F (trade). The relationships between profitability measures EBITDA margin (Model 1), ROA (Model 2), and profit margin (Model 3) and previously stated independent variables are shown in Tables2 –6. Table 2 shows the models 1 – 3 for all four sectors together; Table 3 depicts the results for sector A; Table 4 for sector C; Table 5 sector F; and Table 6 sector G. The analysis of three profitability indicators offers an insight into the robustness of the obtained results.

The joint results for the firms in the four biggest sectors of activity in Eastern Croatia show that market share, labor and capital productivity display robustly positive and labor cost robustly negative influence on profitability (Table 2). Firm growth appears also with a robustly negative coefficient although the coefficient value is negligible. Additionally, for the two out of three profitability measures insolvency and higher capital intensity appear to exert negative impact on firm profitability.

Table 3 analyses sector A in more detail. The results show that the only fairly robust determinant of profitability in agricultural firms in Eastern Croatia are taxes with their negative impact, as anticipated. Liquidity, firm growth, export intensity and capital intensity might have a positive impact on profitability and insolvency negative, but these results are not robust.

Table 4 displays results for the manufacturing sector. There appears to be a robustly positive impact of market share, labor and capital productivity, liquidity and export intensity on firm profitability in this sector. Insolvency, capital intensity and labor cost show robustly negative impact on profitability of manufacturing firms.

Table 5 displays the analysis of the construction sector. It shows that there is no robust firm profitability determinant in this sector. Individual models indicate that labor productivity, firm growth, export intensity but also taxes might have positive impact and insolvency and labor costs negative impact on firm profitability in the construction sector of Eastern Croatia, but these results are not robust.

Table 6 displays the results for the trade sector. It shows that market share, labor and capital productivity and liquidity have a robust positive impact on firm profitability in this sector, while insolvency, indebtedness, export intensity, capital intensity, taxes and labor costs represent negative determinants of firm profitability in East Croatia's trade sector.

4.2. Profitability determinants in Eastern Croatia compared to the rest of Croatia

This chapter contains the models analyzed on the complete sample of 9108 Croatian firms in sectors A, C, F, and G (Tables 7 - 11). The models contain, in addition to previously employed independent variables, the variables derived by their multiplication with the dummy variable for Eastern Croatian companies. This enables testing of the null hypothesis of no difference between the impact of specific determinant on profitability in Eastern Croatia compared to the rest of the country. Statistically significant coefficients next to the variables with the extension "_east" in their names, signify that Eastern Croatia differs from the rest of the country regarding the impact that that specific determinant has on firm profitability.

By inspecting the coefficients and their significance of the variables with the extension "_east" in their names in Table 7 it is evident that export intensity has a more positive, i.e. labor cost less negative impact on profitability in Eastern Croatia compared to the rest of the country. Taxes on the other hand have more pronounced negative impact on profitability in these four sectors of activity in Eastern Croatia.

The analysis of the agricultural sector shows that export intensity has a robustly and significantly greater contribution to firm profitability in Eastern Croatia compared to the rest of the country. Market share, labor productivity and taxes on the other hand display robustly less

positive i.e. more negative impact on agricultural firm profitability in this region compared to the rest of the Croatia (Table 8).

Table 9 shows that in manufacturing sector of Eastern Croatia the profitability determinants do not differ (robustly) as much as in other sectors. It appears that the export intensity has a more beneficial effect, and labor cost less detrimental effect on manufacturing firm profitability in Eastern Croatia compared to the rest of the country.

Table 11 displays the results for the trade sector. Labor productivity appears to impact firm profitability more beneficially and insolvency and labor cost less adversely in the Eastern Croatia compared to the rest. Additionally, export intensity has a less beneficial effect and taxes more negative effect on the profitability of trade companies in the Eastern Croatia compared to the rest of the country.

5. Conclusion

The aim of this paper was to analyze the determinants of firm profitability in Eastern Croatia, and to determine if those determinants differ significantly from the rest of Croatian firm's profitability determinants in the corresponding sectors. The five Eastern Croatian counties that the analysis focuses on are Virovitica-Podravina, Požega-Slavonia, Brod-Posavina, Osijek-Baranja, and Vukovar-Srijem County. The Croatian firm data are obtained for the period from 2008 to 2017 from the Amadeus database on 9108 medium, large, and very large active companies in the four most important sectors of activity in Eastern Croatia, namely agriculture (A), manufacturing(C), construction (F), and trade (G). The methodology used in the analysis is the fixed effects panel model with Driscoll and Kraay (1998) standard errors since they are robust to general forms of cross-sectional dependence, but also autocorrelation and heteroskedasticity.

The results of this comprehensive study enable precise pinpointing of the most important profitability determinants in four sectors of activity in Eastern Croatia, and a determination of whether they are statistically significantly different from the rest of the country. This in turn can direct regional-specific policies to boost profitability and the catch-up process of this region. The obtained results can be summarized as follows.

The analysis of agricultural sector showed robust negative impact of taxes on profitability and this negative impact is significantly greater in the Eastern Croatia compared to the rest of the country. This is an interesting finding for the policy makers wishing to stimulate entrepreneurial activity in this region via tax reduction for producers of agricultural goods. There are several ways of stimulating entrepreneurial activity, as reducing income tax in agriculture, profit tax or introducing grace periods for starting a business in agricultural sector. Export intensity also stands out as a possible great contributor to profitability of agricultural firms, even greater than in the agricultural sector of the other parts of Croatia. It should be noted however that the lack of small firms is the main limitation of the study of agricultural sector in Eastern Croatia since this sector predominantly consists of precisely small family firms. The conclusions of this study hence do not necessarily apply to them.

The firm profitability of the manufacturing sector is positively impacted by the market share, labor productivity, capital productivity, liquidity and export intensity and negatively by insolvency, capital intensity and labor cost. Compared to the rest of the country only the export intensity has a more beneficial effect in this region, just like in the agricultural sector, and labor costs have less detrimental effect on manufacturing firm profitability in Eastern Croatia.

The analysis of the construction sector showed that none of the assumed profitability determinants are robustly statistically significant and also that there are no robust differences in profitability determinants of this sector in Eastern Croatia compared to the rest of the country. This sector, hence, warrants some further analysis.

The trade sector firm profitability is positively determined by the market share, labor and capital productivity and liquidity. At the same time, it is negatively impacted by the insolvency, indebtedness, export intensity, capital intensity, taxes and labor costs. Additionally, the analysis showed that productivity impacts firm profitability more beneficially and insolvency and labor costs less adversely in the Eastern Croatia compared to the rest of the country. Interestingly, export intensity and taxes appear to have more negative effect on the profitability of trade companies in the Eastern Croatia compared to the rest of the country.

In general, the firms in the four biggest sectors of activity in Eastern Croatia benefit from the higher market share, labor productivity and capital productivity. On the other hand, the profitability is negatively impacted by labor costs, insolvency and higher capital intensity. Also, export intensity has on average more beneficial effect on profitability in this region, labor costs are less constraining and taxes have more pronounced negative impact on profitability of in these four sectors of activity in Eastern Croatia.

These results offer clear directions for assisting development of Eastern Croatian entrepreneurship, both in general and sector-specific. Focusing on export-oriented activities in this region, decreasing the tax burden or investing in labor productivity measures are just a few approaches that could help Eastern Croatian catch-up process to the Croatian average. Although labor costs stand out with their negative impact on profitability, this impact is significantly less negative than in the rest of the country, probably because these costs are much lower in Eastern Croatia already. That is why decreasing labor costs would not be one of our main recommendations for stimulating growth of this region, unless it is done through tax cuts.

The main limitations of this study are the absence of small companies in the analysis and the possible errors in the market share calculation (as was explained in the Data section). However, since the analyses of the regional specifics of firm profitability in Croatia have been scarce and only partial, this paper, with its comprehensive empirical panel analysis of the profitability determinants of Eastern Croatia companies from 2008 to 2017, and statistical testing of the differences between these determinants in Eastern Croatia compared to the rest of the country, contributes significantly to the scientific economic literature. Additionally, the robust conclusions of the study have important significance for the economic policy which can tailor the entrepreneurial support according to the needs of specific sectors.

EXPLORATION AND EXPLOITATION OF MINERAL RESOURCES IN ENVIRONMENTAL PROTECTION

ABSTRACT

Environmental protection ensures the complete preservation of environmental quality by individual environmental components (soil, water, air, nature) and the preservation of natural resources and their rational use as a basic condition for sustainable development. Croatia is not particularly rich in mineral resources, but exploration and exploitation, as a primary activity in each country's economy, is of great importance. The exploitation of mineral resources is one of the activities that significantly affect the soil, relief, flora and fauna and partially or completely alter the original complete and recognizable image of the landscape. The purpose of this paper is to identify and analyse anthropogenic agents and the environmental impact of the exploration and exploitation of mineral resources in order to raise awareness of how important our role in environmental protection is. It is important to emphasize that the implementation of existing laws and regulations related to the preservation of environmental quality and environmental components will preserve the existing state of the environment and reduce the adverse impact of the exploitation of mineral resources. The research methodology in this paper was based on theoretical research, which was based on the analysis of data obtained from the competent and public government bodies, as well as inductive - deductive data analysis in order to show the existing state of mineral resources in the Republic of Croatia and its environmental impact.
Predictions and rapid depletion of solid minerals have not materialized (this does not apply to oil and gas whose estimated reserves are limited), so mining will be able to meet the energy sector's needs for mineral resources in the future, with a strong emphasis on environmental protection. Environmental protection has become a strong limiting factor in the excavation of mineral resources.

Key words: *air, water, soil, wildlife, mineral resources.*

1. Introduction

With his very existence, man began to shape the environment and adapt it to his needs. In the initial stages of its development, it slightly disrupted the natural balance in the environment. The natural environment inhabited by man provides with the basic necessities of life and is therefore irreplaceable. At the same time, all those needs, desires, habits and interests of man

that nature cannot directly satisfy, are constantly growing in quantity and quality. Therefore, by using natural resources (air, water, soil, plants, animals) and cultivating them in different ways, man shapes his own environment, different from the natural one. The natural environment is in a multiple crisis today. For this reason, every modern society is necessarily oriented towards setting and adhering to ecological criteria of development, ie concrete ecological standards in all dimensions of life, especially in the fields of production, labour, transport, consumption and leisure, culture and politics (Omejec et al. 2003, 7). With the development of technology and the increased demands to meet their needs, man today has a significant impact on the natural balance and threatens many ecological systems. Over time, great conflicts have arisen in the interrelationship of the natural and human systems, since man has fulfilled his needs and desires without regard to the capabilities and endurance of the natural system. Neglecting, endangering or completely destroying the elements of the primary system, man has caused an increasing shortage of raw materials and the emergence of the first ecological disasters. This led to a gradual change in the relation of man to nature. People began to realize that nature is not an inexhaustible well and that it has limited resources. Awareness of resource constraints arose from people's practical experience. Man's attitude to progress and the environment that surrounds him has produced an ecological crisis, that is, he has changed the state of the natural environment so much that it goes beyond the renewable possibilities of nature (Črnjar, 2002, 15).

Intensive industrial development causes an increased need for mineral exploration, and every type of industry poses a threat to the preservation of environmental quality. Therefore, the exploitation and transportation of mineral resources must take place under controlled conditions. Degradation, or rather environmental damage, means any damage caused to protected plant or animal species and their habitats and landscape structures under a special regulation, which has a significant adverse effect on the maintenance of a favourable condition of a species or habitat type and quality of the landscape (Law on environmental protection NN 80/13, 153/13, 78/15, 12/18 and 118/18). Human relations to the environment, which for almost two centuries has been based on anthropocentrism, have led to a number of global, regional and local environmental problems, culminating in an unfortunate ecological crisis (Afrić, 2002, 578).

At the beginning of a new era, it took 600 years for our planet's population to double, and by the early 19th century. the population has doubled in 80 years, and today it has doubled in 35 years. It only took 12 years for the population to increase by one billion, the shortest period to date. The environmental impact of such a population explosion can be illustrated by the fact that in the early 20th century there is hardly any talk of environmental problems, and today there is talk of an ecological crisis of global proportions (Črnjar, 1997, 28).

In the description of the current state and intensive industrial development in this case of mineral exploitation in this paper, based on the analysis of statistical data, using the theoretical, methodological and empirical literature, the existing state of mineral resources in the Republic of Croatia and its environmental impact are presented. Previous research has stated that climate change, ozone depletion, droughts, forest destruction, threats to the conservation of biological species are all important problems affecting the state of the environment. However, again, without the exploitation of mineral resources, it is impossible to imagine the sustainable development of civilization. Therefore, the aim of this paper is to point out the problems that impose a completely new approach in all industries, including mining. This approach basically involves the direct inclusion of environmental protection and conservation in the development plans of all activities, including the exploitation of mineral resources.

2. Mineral resources and the environment

According to the Croatian Mining Act, mineral resources (mineral resources) are considered to be all organic and inorganic mineral resources that are in solid, liquid or gaseous state in the original deposit, deposits, tailings, smelting or natural solutions. Mineral raw materials within the meaning of the Act are: energy mineral raw materials, mineral raw materials for industrial processing, mineral raw materials for the production of building materials, architectural stone, mineral raw materials of metals Mining Act (NN 56/13, 14/14, 98/19).

Mineral resources are non-renewable natural resources of interest to the Republic of Croatia and are owned by the Republic of Croatia. The very terminology of the word non-renewable natural resource means that it is a source of energy that cannot be regenerated or produced again, therefore it is of interest to the Republic of Croatia and as such defined by the Constitution and applicable Mining Act.

The main feature of non-renewable resources is that their quantities are of a given and constant nature, so the concept of sustainable use of resources as for renewable resources is not applicable to them, but the rate of disappearance and the total amount of resources is important. Calculating and predicting the present and future availability of these resources is very complex. In simple and economic considerations, the rarity of those resources is reflected in the costs and prices. In order to calculate and predict the present and future availability and scarcity of resources, it is necessary to use combined methods of natural and social sciences. Balancing potential stocks of non-renewable resources (related to population growth, technical progress, social and economic expectations, etc.) is a precarious job. Therefore, "debates on resource scarcity" will continue to remain partly within the sphere of "environmental ideology" technocentric and ecocentric views (Črnjar, 2009, 211).

Unlike non-renewable energy sources, which are in limited quantities and pollute the environment, renewable or alternative energy sources can be practically used indefinitely and do not pollute the environment to such an extent as non-renewable energy sources. In addition to geothermal energy, the most significant renewable energy sources are: water energy, bioenergy, wind energy and solar energy. Tidal and wave energy are less significant renewables.

In addition to water energy, the main problems with renewables are cost and low volume of the energy obtained. Renewable energy potential is enormous, but current technological development is not at a level that would allow their exclusive use. In the future it is expected a strong development for several reasons: renewables play a very important role in reducing carbon dioxide emissions into the atmosphere; increasing the share of renewable energy sources increases the sustainability of energy systems and also helps to improve the security of energy delivery by reducing the dependence on imports of energy raw materials and electricity; it is expected that renewables will become economically competitive with conventional energy sources in the near future (Nakić, 2010, 97-98).

According to the Mining Act, mineral exploration involves works and tests that determine their existence, quality, quantity and possible conditions of exploitation, and exploitation is considered to be extraction from the reservoir and breeding. The basic document that defines the management of mineral resources and plans for mining at the national level is the Strategy for the Management of Mineral Resources (drafted in 2008 for a period of 30 years). According to the said Law, the units of regional self-government are obliged to prepare mining-geological studies for their areas as a basis for planning the needs and ways of supply of mineral resources in the development documents of the regional and local level. Based on these studies, after harmonization of all spatial, natural, environmental and other requirements and restrictions, in accordance with laws and regulations, it is decided to open new ones to rationalize the use of

existing exploitation fields. Strategic planning and decision-making on the management of mineral resources should integrate knowledge of geological potentials (with the valorisation of exploitation fields based on the occurrence of mineral resources, geological structure and existing exploitation), spatial-planning conditions and restrictions related to the environment, protection of nature, water, soil, landscape and cultural good.

Mineral resources can be exploited after the authorization issued by the competent authorities have been collected, and this authorization determines the area where the activity can be performed (Law on Physical Planning NN 153/13, 65/17, 114/18, 39/19, 98/19). The mining project serves as the basis for the exploitation of mineral resources and construction of mining facilities. Large-scale mining operations, primarily surface mines, often radically alter the landscape and leave consequences in the natural environment. For the sake of sustainable development of the living world and for aesthetic reasons, it is necessary to re-cultivate the area after the exploitation of the stone raw material. In terms of environmental protection, the obligation of the contractor to preserve the devastated area during the execution and after the exploitation of the raw materials is prescribed. This condition of rehabilitation in the area is conditioned by a location permit (Tušar, 2002, 358).

According to the Environmental Protection Act (NN 80/13, 153/13, 78/15, 12/18,118/18), the environment is the natural and any other environment of organisms and their communities, including man, which enables their existence and their further development: air, sea, water, soil, earth's crust, energy and material goods, cultural heritage as well as part of the environment created by man; all in their diversity and totality of interaction. The environment is still understood as a mere subject of human regulation. In doing so, the protection of the environment or nature is not directed against progress, but rather the fight against natural and unplanned development that is contrary to environmental and human laws (Cifrić, 1989, 29). Damage to the environment due to human economic and other activities is actually a disturbance to the state of natural systems and talks about changes occurring in the physical environment. It is these changes that have a negative impact on life that should be described as an environmental problem, and people who accelerate this phenomenon should be considered one of its causes. As all changes in the physical environment are not environmental problems (e.g. natural phenomena), environmental changes should be considered only those environmental changes that have occurred and are caused by human activity and have a negative impact on life on Earth (Glasbergen, 1995, 39). Awareness of the need to address environmental issues emerged in the late 1960s and early 1970s.

In 1972, a team of American scientists, led by Jay Forrester, published a work called "Limits of Growth," outlining a model of linear exploitation of the economic order that warned that the existing economic system was threatening the Earth's ecological system. It was the first global approach to environmental protection that led to a comparison of economic growth and environmental degradation. At the same time, it emphasizes the reciprocity of the relationship between man and nature, and provides a kind of synthesis of the basic factors that influenced the environmental problems of today (Cifrić, 1989, 7). Initially, environmental policy was oriented towards local problems, but since environmental destruction was a cause for general concern, it soon spread beyond national borders. International environmental law is part of international law that evolved systematically only in the 20th century, following the UN Conference on the Human Environment, held in Stockholm in 1972, although the first international treaties on environmental protection were concluded as early as the 19th century. (Mesec, 2009, 218).

At the UN Conference on Environment and Development in Rio de Janeiro in 1992, the attention of the world public was focused on growing problems related to the issue of development and environment at the local and global level. The Declaration and Action

Program for the 21st Century (Agenda 21), adopted at the Conference, strongly support the principle of sustainable development (Ministry of Foreign and European Affairs, Sustainable Development, 2019). Agenda 21 is the document by which the international community agreed on the program and established priorities for the conservation and management of development resources in the 21st century.

After the Rio Conference, there were a number of worldwide environmental conferences (Johannesburg, Helsinki, Kyoto). The conferences mentioned resulted in the signing of a series of environmental protocols. Scientist Jay Forrester made it in 1972. model of linear exploitation of the world economic order and published his research in the work "Limits of growth" in which he warned that the existing economic system threatens the Earth's ecological system. It is considered to be the first global approach to environmental protection that has led to a comparison of economic growth and environmental degradation (Boulding, 1970, 125). Man's environmental impact, his limited knowledge of nature, but also his lack of knowledge about the potential consequences of environmental impact, have led to the need to control and reduce this adverse environmental impact through the implementation of environmental policies. Today environmental policy is understood as public environmental management, as a common good, and includes the prevention of further spread of environmental degradation and all types of pollution, public control of all sources of pollution, rational utilization of existing natural resources and directing production processes, transport and various services to clean and harmless technologies (Čizmić, 2005, 62).

Environmental legislation in the Republic of Croatia is made up of international treaties (conventions and protocols) laws and their implementing regulations approved by the Croatian Parliament. The umbrella law on environmental protection in the Republic of Croatia is the Environmental Protection Act. This law provides the basis for the adoption of a series of implementing acts that fully harmonize the legislation of the Republic of Croatia with the European legislation. In the coming period, Croatia faces the challenge of effectively implementing transposed directives and policies that will contribute to the fulfilment of environmental obligations assumed by Croatia's full EU membership. The basic strategic documents are the "National Environmental Strategy" and the "National Environmental Action Plan" of 2002. The objectives and measures for the protection of individual environmental components are defined within the sectoral strategic documents. The description of the current situation in the national strategy states, inter alia: "The exploitation of mineral resources in Croatia includes surface exploitation, exploitation from the bottom of watercourses and stagnant waters, exploitation from the seabed, exploitation from the underground and exploitation from seawater. Particularly negative impact, primarily on the landscape, is the exploitation of surface mines. The main problems are: low environmental priority due to lack of awareness of sustainable development and low economic power, air, water and soil pollution, inadequate production structure of the industry, outdated technology and outdated industrial equipment, poor location of production facilities (noise, landscape), lack of financial resources for industrial investment, restructuring, the introduction of clean technologies (National Environmental Strategy and National Environmental Action Plan NN 46/02). The main factors that influenced the development of the EU's environmental policy are issues related to transboundary pollution, establishing conditions for fair and free trade and developing efficient and sustainable economic growth (Kersan-Škabić, 2015, 437). The basic documents dealing with environmental policy in the EU are environmental action programs. They set out the principles and objectives of the environmental policy for a particular period. Horizontal environmental legislation in the European Union is made up of directives governing the environmental field and other related areas. By their nature, these directives are more procedural than technical. They prescribe procedures and mechanisms aimed at integrating

environmental care into decisions taken in both the public and private sectors, particularly related to land use and the management of natural resources.

According to the current legislation in the Republic of Croatia, surface, underground and underwater mining facilities are a subject to environmental activities for which an environmental impact assessment or study is required. Environmental Impact Assessment (EIA) is a process of assessing the acceptability of an intended intervention with respect to the environmental acceptability of a particular area and determining the necessary environmental measures, in order to minimize the impacts and achieve the highest environmental quality possible (Assessment Regulation environmental impact of the project NN 6/14, 3/17). The study must evaluate the environmental impact of the intervention based on the factors that depend on the type of intervention and the environmental characteristics. The study must determine the extent, magnitude and duration of the impact, such as meteorological, climatological, hydrological, hydrogeological, geological, geotechnical, seismological, pedological, bioecological, landscape, health, sociological, rural, urban, traffic (Mesec, 2009, 22).

3. Annual balance sheets of mineral resources reserves

The significant growth of the construction industry, as well as the slight recovery of the manufacturing industry (with the introduction of new environmentally friendly technologies), which has been happening in Croatia in recent years, also requires an adequate exploitation of mineral resources that are the basis of construction as well as raw materials for industrial processing.

According to data from the Ministry of Economy of the Mining Directorate from 2013, there are 759 exploitation fields in the Republic of Croatia (Mining - Geological Study of the County of Varaždin "Official Gazette of the County of Varaždin" 29/16). According to the type of raw material being excavated or to be excavated on the basis of confirmed exploitation reserves, the approved exploitation fields shown in Table 1.

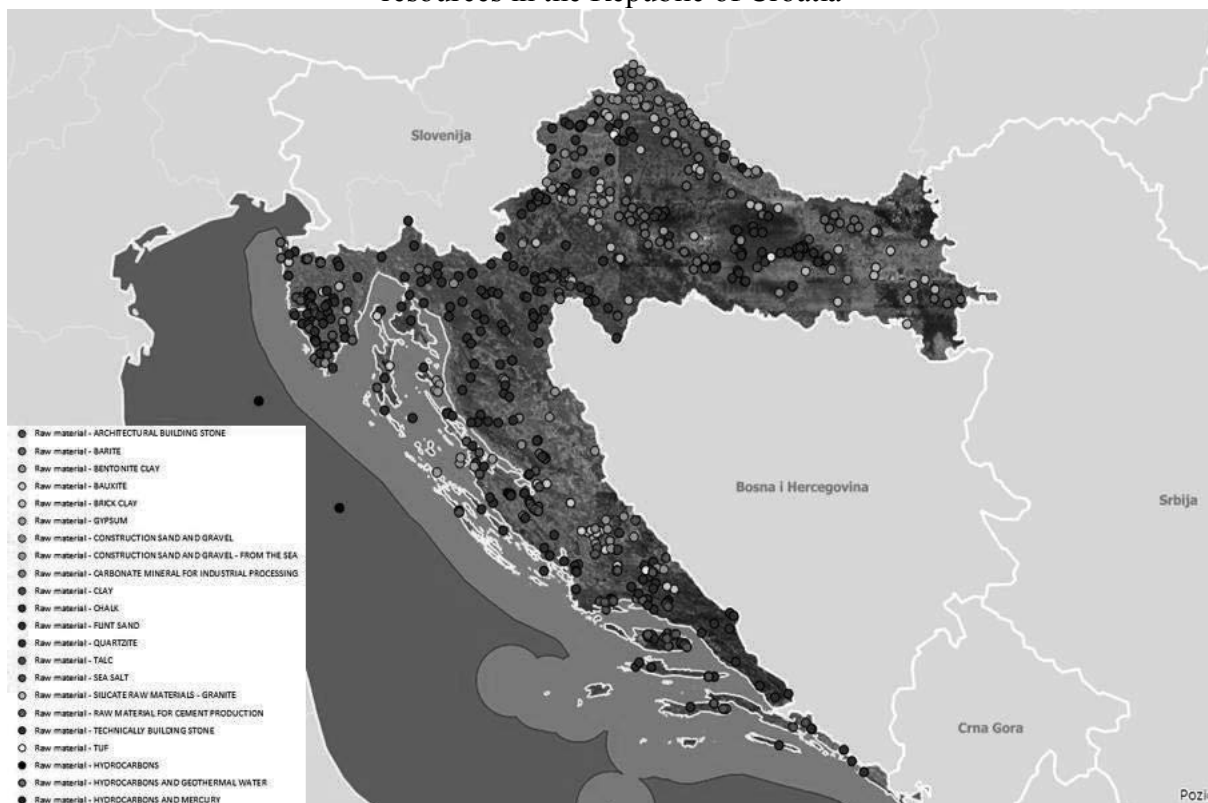
Table 1: Mineral exploration in the Republic of Croatia

TYPE OF MINERAL RAW MATERIAL	NUMBER OF OPERATING FIELDS
Architectural building stone	128 exploitation fields
Asphalt	1 exploitation fields
Barite	9 exploitation fields
Bentonite clay	1 exploitation fields
Bauxite	26 exploitation fields
Clay brick	36 exploitation fields
Geothermal water	5 exploitation fields
Gypsum	13 exploitation fields
Construction sand and gravel	134 exploitation fields
Construction sand and gravel	14 exploitation fields
Ceramic and refractory clays	12 exploitation fields
Flint sand	19 exploitation fields
Milovka	1 exploitation fields

TYPE OF MINERAL RAW MATERIAL	NUMBER OF OPERATING FIELDS
Mineral raw material for cement	11 exploitation fields
Sea salt	4 exploitation fields
Silicate raw material for industrial processing	1 exploitation fields
Technical building stone	271 exploitation fields
Tuf	4 exploitation fields
Coal	9 exploitation fields
Hydrocarbons (petroleum)	60 exploitation fields
Total: 759	**759 exploitation fields**

Source: Mining-geological study of Varaždin County, June 2016

Within the Department for Sector Pressure Monitoring, a database was created with a GIS software showing the exploitation and exploration fields of mineral resources in the Republic of Croatia. What it looks like is shown in Figure 1. The database was created according to the data of the Ministry of Economy, Entrepreneurship and Crafts, Mining Sector, and covers the period until 30.1.2016 (Ministry of Economy, Labour and Entrepreneurship, https://www.mingo.hr/public/documents/107-vodic-zastita-okolisa-lowresfinalweb.pdf).

Figure 1: GIS software representation of exploitation and exploration fields of mineral resources in the Republic of Croatia


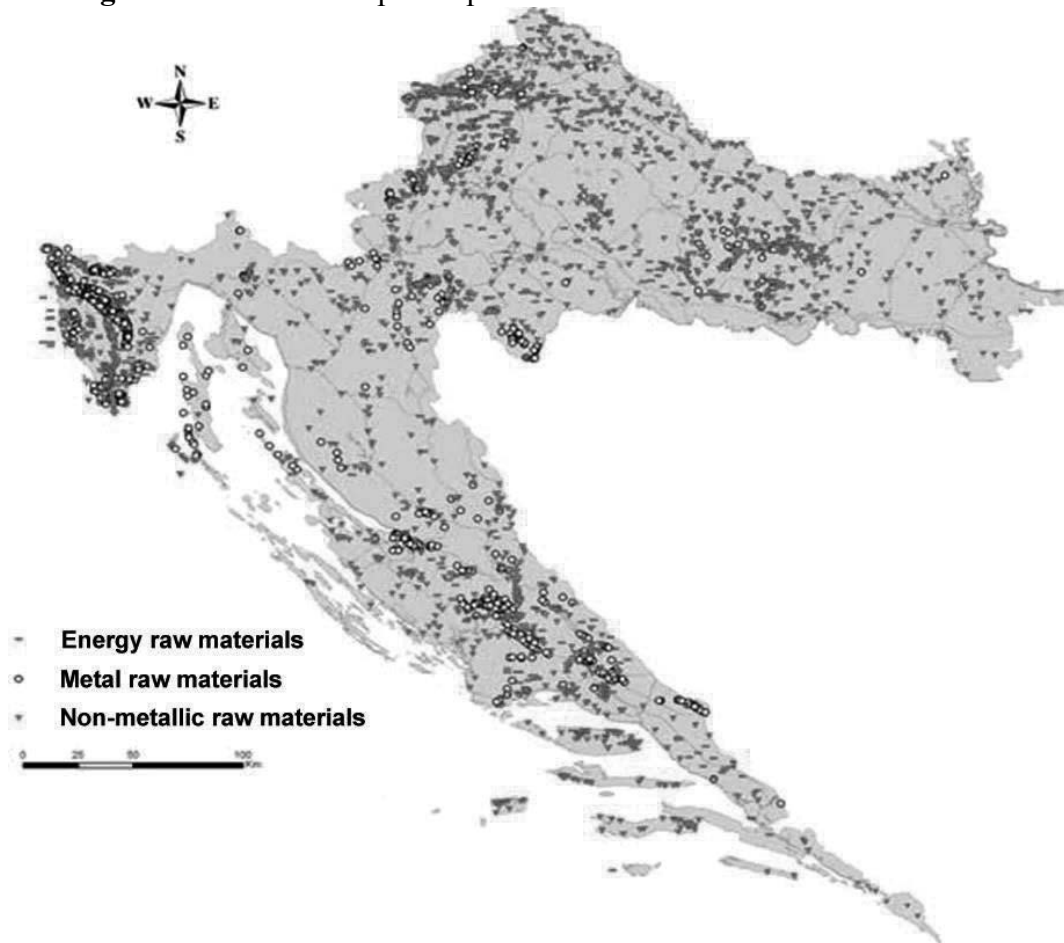
Source: Croatian Agency for the Environment and Nature, 2016

Among the non-energy raw materials for the Republic of Croatia, of particular economic importance are: architectural - building stone, technical building stone, construction gravel and

sand. Technically building stone is mostly found in the Dinarides - from Istria to the southernmost parts of Dalmatia. Architectural - building stone is restricted to tectonically less disturbed rocks, and deposits of building gravel and sand are mostly in areas along river courses. According to the results of more recent exploratory work, in 2012, larger quantities of exploitation reserves of most non-energy mineral resources were recorded compared to the 1997 data. During this period, the utilization of registered exploitation reserves decreased by more than 50%, which opened the space for increasing economic activities for the exploitation and processing of certain raw materials. The most significant positive differences of the established exploitation reserves are: architectural and building stone, bauxite, gypsum, gravel and sand, carbonate raw material for industrial processing, silica sand, silicate raw materials for industrial processing, raw materials for cement production, technical building stone and mercury (Spatial Development Strategy of the Republic of Croatia NN 106/17).

The basis for the economic development of a country and its social standard is based on a sufficient amount of energy as well as security of energy supply. With the increase of energy consumption, the need for energy minerals and their exploitation and processing increased. The energy needs in Croatia are largely met by the use of energy minerals - coal, oil, natural gas and radioactive minerals. In Croatia, reserves of coal, oil, natural gas and geothermal water have been established, and reserves of radioactive mineral resources have not been established.

In 2015, the share of natural gas in primary energy production was 27%, crude oil 12.5%, and the share of thermal energy was almost negligible and amounted to about 0.2% (Ministry of Environment and Energy, Annual energy review - Energy in Croatia 2015). Exploitation reserves of all energy mineral resources decreased from 1997 to 2012, with natural gas exploitation increasing, geothermal water exploitation stagnating, and condensate and oil exploitation decreased. Coal has not been exploited in the Republic of Croatia since 1994 (Spatial Development Strategy of the Republic of Croatia (NN 106/17). Unlike other types of economic development activities, mineral resources can be exploited only at places where their deposits have been established. Taking up space for the exploitation of mineral resources basically related to the location predisposition of a particular mineral resource. Acceptance of a certain space as a possibility for exploitation depends on a number of factors (economic, spatial, ecological, etc.). Figure 2. shows a map of the locations and the occurrence of mineral resources.

Figure 2: Overview map of deposits and occurrence of mineral resources


Source: Map of mineral resources, project code 181-1811096-1104, Croatian Geological Institute

It is clear that the exploitation of mineral resources is, by its nature, likely to cause a number of environmental impacts. However, it should be emphasized that these impacts remain largely localized and do not have far-reaching effects outside the immediate vicinity of the site of exploitation.

It should be pointed out that ores are a national treasure and a non-renewable resource, and mining is a comprehensive and complete branch of technology, without which the survival of civilization is unthinkable. Therefore, intensive industrial development, which entails increasing needs for the exploitation of mineral resources, especially energy, imposes the necessity of a balanced approach in meeting the social and economic needs for environmental protection, which is also the definition of the concept of sustainable development. The development of mining in the future will depend to a large extent on further population growth on Earth, related demand for energy and mineral resources, realistic estimates of existing ore reserves, assumptions about the economic growth of individual regions and the state of the environment.

Given that the exploitation of mineral resources has a significant impact on the area (landscape, environment), i.e. significantly changes the landscape image and the state of the environment, it would be necessary to determine the future use of the space to be established after the exploitation already before the beginning, or possibly in the initial stages of exploitation. , in order to adapt the exploitation as necessary to its future purpose, i.e. to enable the intended purpose after the exploitation has been completed. Spatial planning documents generally plan

other future uses of the space in principle, but given the relatively long time period of performing mineral exploration activities, the realization of the planned final purpose is problematic, especially finding investors who would be interested in realizing the final second purpose of the exploitation field after completed exploits. The restoration of the space to its original state, which is often referred to in the spatial planning documents as a future final purpose is almost never possible (especially in the case of the exploitation of technical building stone).

4. Conclusion

The exploitation of mineral resources is one of the activities that significantly affect the soil, relief, flora and fauna and partially or completely alter the original complete and recognizable image of the landscape. The exploitation of mineral resources by surface mining takes up larger areas and has many more direct effects on space and the environment. Given the environmental sensitivity, environmental research has become a powerful control mechanism in the exploration and exploitation of mineral resources. In addition to the physical devastation of the area, in terms of relief change, landslide occurrence, loss of vegetation, soil subsidence (due to underground work and the detrimental effects of blasting), etc., qualitative devastation is possible as a result of various contaminants (soil, water, air), changes microclimates (due to removal of larger forest areas, creation of artificial lakes), ecosystem change (logging and dust, exploitation process). The major risk of space degradation due to large-scale pollution is the area of exploration, exploitation and transportation of oil (especially marine corridors). It is very important to carefully plan locations and boundaries of new exploitation fields in relation to distances from existing buildings, boundaries of construction areas of settlements, tourist zones, economic zones, recreational and special purpose zones and established infrastructure corridors, taking into account the type of mineral raw materials and how they are obtained.

WOMEN'S POLITICAL REPRESENTATION AND BUDGET TRANSPARENCY IN CITIES AND MUNICIPALITIES OF EASTERN CROATIA[1]

ABSTRACT

Although the role of women in the politics is a topic of growing interest, the relationship between the number of women in governments' representative bodies and budget transparency has not been explored sufficiently, especially at the local government level. The main objective of this article is to identify the link between the level of local government unit (LGU) budget transparency and women's political representation in LGU representative bodies (local councils) in Eastern Croatia. Firstly, based on a descriptive analysis, observations are made for 555 Croatian LGUs (municipalities and cities, excluding City of Zagreb) about where women are more represented: i) in municipalities or cities; ii) in larger or smaller LGUs; iii) in poorer or richer LGUs; and iv) in which of the five regions (as classified by the Tax Administration). Then, a cluster analysis is conducted for all 127 Eastern Croatia LGUs for the period 2014-2018, controlling for several variables. The results are presented for all cities and municipalities in Eastern Croatia together and then separately for municipalities and separately for cities. A strong link is established between a larger number of women in local councils and higher budget transparency, particularly in cities. This relationship is accompanied by higher fiscal capacity and internet access, and a lower unemployment rate and voter turnout.

Key words: *gender, budget transparency, Croatia, Eastern Croatia, cluster analysis.*

1. Introduction

The role of women and their representation in political and public life is one of the leading topics relating to the global challenges of gender equality. Women are still under-represented

---

when it comes to decision-making and leadership positions at all levels of government. The OECD (2014) points out that greater equality in gender representation in political spheres can have a positive impact on economic and social outcomes including contributing to enhanced citizen trust in government and reinforcing inclusive and participatory policies. The European Commission (2013) also encourages private and public organizations to promote gender diversity in leadership positions. It is argued that female political representatives achieve better communication with citizens and are generally more inclusive when it comes to decision-making than men (Fox & Schuhmann, 1999). Furthermore Gilligan (1982) argues that while men are more self-reliant and rule-bound, women are more flexible, open to other opinions and ideas and the expression of interconnectedness. Eagly & Karau (2002) add that women are more communicative, open to cooperation and empathetic, which may lead to an increase of citizens' trust in government.

Very little research has been done relating to the political representation of women at the local government level, but authors like De Araújo & Tejedo-Romero (2018) show how, given their more open and inclusive leadership style, a greater representation of women councillors and executives contributes to more transparent governance. De Araújo & Tejedo-Romero (2016) argue that gender equality is crucial for local government representative democracy, which links local budgets to the needs of ordinary citizens, and that for ordinary citizens LGU budgets are very important because numerous key public services are provided from these budgets. They also argue that the problems of budget transparency might be more important at the local government level since local government officials have more discretion in making budget decisions than officials at the national level and this is one of the reasons this analysis is focused at the local government level.

Our previous research has identified resident's income, LGU fiscal capacity and administrative capacity (Mourao, Bronić & Stanić, 2020; Ott, Mačkić, Bronić & Stanić, 2019); political ideology and political competition (Ott, Mačkić & Bronić, 2019, 2018) as important determinants of local budget transparency. This paper aims to explore whether there is any relationship between female political representation and budget transparency at the local government level. Using data on local election results, this paper firstly identifies the women councillors and mayors/municipality heads in 555 Croatian municipalities and cities.[2] Using this information, it is possible to analyse in which of them women's political representation is higher (cities or municipalities, in larger or smaller LGUs, poorer or richer, etc.). Secondly, based on theoretical and empirical underpinnings, cluster analysis is conducted for 127 Eastern Croatian LGUs for the period 2014-2018 to demonstrate a possible link between women's political representation (WPR) and local budget transparency levels. Local budget transparency is measured by timely publication of five key budget documents (budget proposal, enacted budget, citizens' guide, mid-year and year-end reports) on the LGUs' websites (Ott, Bronić, Petrušić, Stanić & Prijaković, 2019). The paper seeks to contribute to the growing literature on the importance of promoting gender diversity in local political spheres, thus establishing the relationship between WPR and local political accountability, proxied by an LGU's budget transparency levels.

The rest of the paper presents the theoretical background, the data and their descriptive analysis, the methodology and results of the cluster analysis, ending with results, conclusions, limitations and suggestions for future research.

---

[2] Zagreb is not included because of the comparability of the data and because it has the status of both city and county.

2. Theoretical background

In line with the settings of social role theory and status characteristics theory, it is argued that women and men have certain characteristics that direct them towards particularly different types of roles and standards of behaviour (Birgit, 2007). One of the first social science studies on women, their individuality and integrity was presented by Gilligan (1982). She pointed out that women and men have different moral commitments, different perceptions and understandings of reality conditioned by social norms, which is why they express different systems of values and behaviour. Thus, women tend to be more compassionate, more concerned with the needs and wishes of others, and at the same time less commanding and self-confident than men (Eagly & Steffen, 1984). Several authors have highlighted the fact that women tend to have a strong sense of equity and community (Hamidullah, Riccucci & Pandey, 2015); different ways of communicating, approaching and influencing others (Merchant, 2012) and are more willing to cooperate and more egalitarian (Eagly & Johannesen-Schmidt, 2001).

The literature shows that due to the mentioned female characteristics the style of women's leadership and communication is more open, inclusive, approachable and transparent; and that women are closer to the idea of disclosing budget information, fostering greater budget transparency and are more likely to involve traditionally excluded and vulnerable groups in budgetary processes (Beck, 2001; Fox & Schuhmann, 1999). Thus, women's leadership styles could improve the public administration governance (del Sol, 2013). Increasing budget transparency contributes to reducing information asymmetry between citizens and government, i.e. greater budget transparency can solve the agency problem by increasing the ability of citizens to monitor the activities of elected representatives and scrutinize published budgetary information over all stages of the budget process (Laswad, Fisher & Oyelere, 2005). Women are more likely to resolve the agency dilemma and information asymmetry, since they are more willing to have their actions monitored and controlled, to cooperate and be readier for compromise, which enables them to resolve conflict situations faster than their male counterparts (Rosenthal, 2000). These typical characteristics of women help them embrace higher transparency levels, increasing legitimacy of their actions and the actions of their LGUs, encouraging cooperation, which helps them gain more citizen trust.

In the last decade, there has been a growing interest in research on WPR and its links to the turnaround in government activities, changes in decision-making, and especially in the allocation of budgetary resources (e.g. De Araújo & Tejedo-Romero, 2016). Representative democracies are investing more effort into various activities that support more opportunities for women leaders, that is, their greater political representation. Accordingly, a greater number of female political representatives and a theoretical background on the different social roles between the sexes have contributed to the rise in research on the link between WPR and governance styles and mechanisms, especially budget transparency.

Several studies have explored this relationship at the local government level, employing a dummy variable if the mayor / municipality head was female, and exploring its impact on the LGU budget transparency. De Araújo & Tejedo-Romero (2018) conducted a panel data analysis on a sample of Spanish municipalities, concluding that greater representation of women's executives has a positive impact on local budget transparency. Similarly, Tavares & da Cruz (2017), based on OLS estimates, found that male mayors show lower levels of budget transparency than their female counterparts. On the other hand, on a sample of Italian and Spanish municipalities and using Tobit regression analysis, Gesuele, Metallo & Longobardi (2018) indicated a negative relationship between women mayors and LGU budget transparency.

However, a negative relationship was significant only in one of the three models presented. De Araújo & Tejedo-Romero (2016) enriched the analysis including an additional indicator - the proportion of women councillors in the local council. In this way, their WPR in a particular LGU consisted of two variables: (1) a dummy, if the woman was the mayor and (2) the proportion of women councillors. They found that in Spanish municipalities, a greater representation of women in local political life contributes to greater local budget transparency and, consequently, a reduction in information-asymmetry in the principal-agent relationship.

Accordingly, this paper, presents the state of WPR in Croatian local councils and local executives, hypothesizing that greater WPR is positively associated with higher levels of budget transparency.

3. Data and descriptive analysis

This section presents a descriptive analysis and offers observations on WPR for 555 Croatian LGUs (municipalities and cities).

3.1. WPR in Croatian 555 cities and municipalities

Graph 1 shows the average representation of women in local councils and local executive from the 2013 and 2017 local elections. Compared to 2013, the 2017 average WPR in both local councils and local executives increased. This increase is higher in municipalities, especially when it comes to councils. If 555 LGUs (cities and municipalities) are considered, in 2017, average WPR in local councils was more than 45% higher than in 2013 (Graph 1).

Graph 1: Average women's political representation, 2013 and 2017 local elections, in %
Source: Authors based on State Electoral Commission (2019).

3.2. Population and WPR

Although women executives won only in 6% of all LGUs (cities and municipalities) in the 2013 local elections, some features can be highlighted: 75% of LGUs with a woman as the head of the executive had a small population of less than 5,000 and only 5 had a population of more than 10,000 (Pleternica, Knin, Viškovo, Koprivnica, Sisak). In the 2017 local elections, the number of women executives increased slightly, but to only 9% of the total number of LGUs.

These are again almost all small municipalities and cities with fewer than 10,000 inhabitants, and only three - Viškovo, Sinj and Sisak - with more than 10,000 inhabitants.

When it comes to local councils, in the 2013 local elections, 17 LGUs with the largest WPR in local councils were again small ones with fewer than 4,000 inhabitants - almost all were municipalities except for two cities – Novigrad (Istria) and Vis. In almost 14% of LGUs women were not given any seats in local councils. These are mostly LGUs with fewer than 5,000 inhabitants (95%), and only 4 LGUs with more than 5,000 inhabitants - Klinča Sela, Nuštar, Križ and Matulji. A similar pattern was repeated in the 2017 local elections, where the 15 LGUs with the largest WPR in local councils were all small municipalities with fewer than 4,000 inhabitants, and only one city - Biograd na Moru - with 5,800 inhabitants. In 4% of LGUs women did not have a single seat in local councils; these are mainly small municipalities with populations of less than 5,000 with the exception of two cities - Nin and Opuzen.

3.3. Fiscal capacity (as a proxy for LGUs' wealth) and WPR

After the 2013 local elections, in the period 2014-2016, the average fiscal capacity per capita[3] of LGUs with a female executive is greater than the fiscal capacity of LGUs with a male executive (HRK 3,005 vs. HRK 2,698). In the 20 municipalities and cities with the most women in local councils, the average fiscal capacity per capita is HRK 3,824.[4]

However, after the 2017 elections, in the period 2017-2018, the average fiscal capacity of LGUs with a female executive is lower than that of a male executive (HRK 2,802 vs. HRK 3,157). For the 20 LGUs with the most women in local councils, the average fiscal capacity is the same as for the male executive (HRK 3,158).[5]

3.4. Tax Administration regions and WPR

WPR in local councils is higher than in local executives. WPR in local executives is lowest in Northern Croatia and highest in Central Croatia, while in local councils it is lowest in Dalmatia and Eastern Croatia and highest in North-Adriatic Croatia (Graph 2).

---

[3] Fiscal capacity can be defined as the ability of an LGU to raise revenues for public spending on its territory (Martinez-Vazquez & Timofeev, 2008). For the 2013 local elections, the average fiscal capacity per capita in the period 2014-16 is used; for the 2017 local elections, the average fiscal capacity per capita in the period 2017-18 is used.

[4] Of the 77 LGUs that have no women in the local council, 67% have a fiscal capacity per capita of less than HRK 2,000.

[5] Of the 20 LGUs with no women in the local council, 63% have a fiscal capacity per capita of less than HRK 2,500.

Graph 2: Women's political representation in five regions* (in %, average values)
*Regions according to Tax Administration classification.
Source: Authors' calculations based on State Electoral Commission (2019).

Prior to the cluster analysis, a measure of local budget transparency in the 2014-2018 period is presented, by regions as classified by the Tax Administration (Graph 3). LGUs' budget transparency is measured annually by the Open Local Budget Index (OLBI), which is represented by the timely availability of five key budget documents (budget proposal, enacted budget, year-end report, mid-year report, and citizens budget), published on websites of municipalities and cities (Ott et al., 2019).

Graph 3: Budget transparency score for Croatian regions* (average values)
*Regions according to Tax Administration classification
Source: Authors' calculations based on Ott et al. (2019)

Graph 3 shows that in the observed period the average annual budget transparency of municipalities and cities has increased in all regions, the lowest being in Dalmatia and Eastern Croatia, and the highest in North-Adriatic Croatia.

4. Cluster analysis

The following cluster analysis was carried out on three separate samples: (i) all municipalities and cities in Eastern Croatia (127); (ii) all municipalities in Eastern Croatia (105); (iii) all cities

in Eastern Croatia (22). In addition to the WPR in local councils and local government budget transparency, four control variables have been added - LGUs' fiscal capacity per capita (pc), unemployment rate, voter turnout, and internet access[6] (Table 1). Unfortunately, the variable 'gender of the executive' is not included in the analysis because it does not contribute to clustering, given the low level of representation of women local executive positions (in the elections of 2013 slightly more than 5% and in those of 2017 fewer than 8% of mayoral contests were won by women).

Table 1: Definition of variables

Variable	Description	Source
women_council	Share of females in local councils; local elections 2013 and 2017 (in %).	State Electoral Commission (2019)
OLBI	Open Local Budget Index measured as the annual availability of five key local budget documents (budget proposal, enacted budget, year-end report, mid-year report, and citizens budget) on websites of cities and municipalities, ranging from 0 to 5.	Ott et al. (2019)
fiscal_cap_pc	Fiscal capacity pc, i.e. LGUs' own revenues pc, calculated as operating revenues minus all grants.	Ministry of Finance (2019). Pc values are based on population estimates from CBS (2020).
unempl_rate	Unemployment rate – Croatian Employment Service data on registered unemployed persons by LGU (in %).	Obtained on request from the Ministry of Regional Development and EU Funds (2019)
vot_turn	Percentage of voters in local elections 2013 and 2017.	State Electoral Commission (2019)
int_acc	Percentage of households with broadband internet access (data transmission speeds of 2 Mbit/s and more).	Croatian Regulatory Authority for Network Industries (2019)

In the 2013 local elections, in 20 LGUs women did not take a single seat, while in the 2017 elections the same happened with 4 municipalities - Bilje, Bizovac, Nova Kapela and Voćin (State Electoral Commission, 2019). Table 2 presents summary statistics for municipalities and cities of Eastern Croatia in the period 2014-2018. The municipality of Slavonski Šamac has the highest share of women in the local council (almost 50%). When it comes to budget transparency, the municipalities of Punitovci and Gorjani published no key budget documents in 2014-2018 period. Only two cities, Slavonski Brod and Osijek, published all five key budget documents. Although the mean of the variable *unempl_rate* is high; the lowest unemployment rate is in Klakar municipality (below 14%), and the highest is in Jagodnjak municipality (around 45%).

Table 2: Summary statistics – cities and municipalities

	women_council	OLBI	fiscal_cap_pc	unempl_rate	vot_turn	int_acc
Mean	17.91	2.67	1,647	24.15	52.08	36.69
Median	18.33	2.80	1,503	23.17	51.15	36.14
Min.	0.00	0.00	905	13.82	38.34	18.82
Max.	49.09	5.00	3,620	45.20	70.97	64.87

Note: Average values 2014-2018, except for the *women_council* and *vot_turn* variables for which average values are calculated based on the 2013 and 2017 local elections. *Source: Authors' calculation*

---

[6] Fiscal capacity per capita was chosen because it reflects the financial strength of the LGU, the so-called supply factor, and voter turnout because it proxies the political engagement of the local population (demand factor). The unemployment rate reflects the general local economic situation and internet access is included because it is *online* local budgetary transparency that is measured.

If observed separately, cities are on average more transparent than municipalities with a higher proportion of women in local councils, higher fiscal capacity and internet access, and lower unemployment rate and voter turnout.[7]

Before performing the cluster analysis, it is necessary to standardize the values of the variables by using the z-score normalization of the original values of the variables, applying the following calculation for each variable:

$$z = \frac{x - \mu}{\sigma} \tag{1}$$

where:

z = standardized value

x = original value of the variable

μ = mean value

σ = standard deviation.

This paper applies K-means clustering, according to which n observations (127 LGUs of Eastern Croatia) are divided into k clusters, and each observation belongs to the cluster with the closest mean. Accordingly, this technique suggests a division into 3 clusters (Table 3).

Table 3: Cluster means, original values

	women_council	OLBI	fiscal_cap_pc	unempl_rate	vot_turn	int_acc
1	15.87 (-0.25)	1.91 (-0.73)	1,616.34 (-0.06)	30.39 (0.88)	54.94 (0.41)	31.01 (-0.78)
2	17.17 (-0.09)	2.97 (0.29)	1,381.87 (-0.51)	20.63 (-0.49)	51.15 (-0.13)	38.59 (0.26)
3	23.82 (0.71)	3.38 (0.68)	2,385.75 (1.43)	20.93 (-0.45)	48.86 (-0.46)	42.95 (0.86)

Note: standardized values in parentheses
Source: Authors' calculation

The mean values of the variables reported in Table 3 clearly indicate the association between women's political representation in local council and budget transparency in Eastern Croatia's LGUs. Three clusters are singled out:

- Cluster 1 indicates that the representation of women in the local council is lowest in LGUs with the lowest budget transparency. This relationship is accompanied by the highest unemployment rate, the lowest internet access, relatively low fiscal capacity per capita and the highest voter turnout.
- Cluster 3 shows that the highest budget transparency is in LGUs that have the highest number of women in the local council. The same LGUs also show the highest fiscal capacity per capita, lower unemployment rates, highest internet access and lowest voter turnout.
- Cluster 2 also follows the pattern of movement of the variables established in the previous clusters, i.e. the 'in between' values of the variables *women_council* and *OLBI*. Accordingly, interpretation of the results and conclusions can be drawn on the basis of all three established clusters.

Table 4: Cluster means municipalities

	women_council	OLBI	fiscal_cap_pc	unempl_rate	vot_turn	int_acc
1	15.76 (-0.13)	1.75 (-0.83)	1,456 (-0.19)	30.54 (0.75)	55.22 (0.33)	31.19 (-0.66)
2	17.39 (0.06)	3.02 (0.41)	1,353 (-0.41)	20.67 (-0.61)	51.31 (-0.24)	38.72 (0.54)
3	17.90 (0.12)	3.20 (0.59)	2,489 (1.92)	27.13 (0.28)	53.11 (0.02)	33.47 (-0.29)

Note: standardized values in parentheses
Source: Authors' calculation

---

[7] Summary statistics for municipalities and cities separately are available upon request.

Results of the cluster analysis for 105 Eastern Croatia municipalities are shown in Table 4. Three clusters are suggested. Cluster 1 contains municipalities with the lowest representation of women in the municipal council and the lowest budget transparency. This relationship is accompanied by the lowest internet access, highest unemployment rate, relatively low fiscal capacity per capita and relatively high voter turnout. Cluster 3 consists of municipalities with the highest representation of women in the municipal council and highest budget transparency. This relationship is accompanied by highest fiscal capacity per capita, voter turnout, relatively low unemployment rate and relatively high internet access.

Table 5: Cluster means cities

	women_council	OLBI	fiscal_cap_pc	unempl_rate	vot_turn	int_acc
1	20.36 (-0.49)	2.47 (-0.48)	2,012 (-0.22)	20.80 (0.26)	50.84 (0.52)	38.60 (-0.56)
2	25.76 (0.59)	3.64 (0.57)	2,208 (0.26)	18.46 (-0.31)	44.49 (-0.63)	48.89 (0.68)

Note: standardized values in parentheses
Source: Authors' calculation

Table 5 shows cluster analysis for 25 Eastern Croatia cities with two clusters obtained. Cluster 1 singles out cities with the lowest representation of women in the city council and the lowest budget transparency. This relationship is accompanied by the lowest fiscal capacity per capita and internet access, as well as the highest unemployment rate and voter turnout. Cluster 2 contains cities with the highest representation of women in the city council and highest budget transparency. This relationship is accompanied by the highest fiscal capacity per capita and internet access, as well as the lowest voter turnout and unemployment rate.

The results suggest that greater women's representation in municipal and city councils is connected with higher LGU budget transparency. As argued by Beck (2001) and Fox & Schuhmann (1999), it seems that women bring a new perspective to political processes, putting more pressure on disclosing budget information (greater budget transparency). Women are more likely to resolve information asymmetries arising in agency dilemmas by embracing transparency, having their actions monitored, and collaborating and involving others in problem solving (Rosenthal, 2000).

The results of this cluster analysis are consistent with previous similar studies; De Araújo & Tejedo-Romero (2016), which observed the proportion of women in local councils, concluding that in Spanish municipalities, a greater representation of women in local political life contributes to greater budget transparency; De Araújo & Tejedo-Romero (2018) who found that greater representation of women's executives has a positive impact on local budget transparency in the Spanish municipalities; and Tavares & da Cruz (2017), who found that male mayors show lower levels of budget transparency than their female counterparts.

Table A in the Appendix presents the results of cluster analysis for municipalities and cities combined, while the tables that present municipalities and cities separately are available upon request.

5. Conclusion

This paper identifies the relationship between the level of local budget transparency and women's political representation in local councils in Eastern Croatia. Firstly, based on a descriptive analysis, observations are made for 555 Croatian municipalities and cities regarding women in local councils and local executives. In 2017 the number of women in both local councils and local executives slightly increased over the 2013 figures; women's political

representation is higher in cities than in municipalities; and women are more present in local councils than in local executives. Of the five tax administration regions, on average, the highest proportion of women in local executives is in Central Croatia, and the lowest in Northern Croatia; the highest number of women in local councils is in North-Adriatic Croatia, and the lowest in Dalmatia and Eastern Croatia. In the 2014-2018 period, LGUs of North-Adriatic Croatia show on average the highest and those of Dalmatia and Eastern Croatia the lowest levels of budget transparency.

In order to identify the connection between women's political representation and budget transparency in Eastern Croatia LGUs, a cluster analysis was conducted for three samples: (i) all 127 municipalities and cities, (ii) all 105 municipalities, and (iii) all 22 cities. Results point to greater budget transparency in LGUs with more women in local councils. This is further supported by high fiscal capacity per capita and internet access, and low unemployment rate and voter turnout.

There are two basic policy implications of this paper, the necessity of promoting (1) gender diversity in local political life, and (2) greater LGU budget transparency. According to cultural models that show gender differences - social role theory and status characteristics theory - both men and women on average have certain characteristics that direct them towards particular types of roles and behaviours. Given the theoretical underpinnings, previous empirical results, and the results obtained in this paper, all parties involved should promote greater female inclusiveness in local councils and local executives. This implies that the central government should consider promoting gender policies to motivate women to run for local councils and local executives; or even introducing female quotas for local councils. LGUs also need to think of encouraging women to compete for local councils and local executives. Finally, women themselves need to become more active and involved in local political life. Also, the central government, counties, and associations of counties, cities and municipalities should continuously promote higher levels of local budget transparency, in order to create realistic opportunities for effective citizen participation in the local budget process. Government should start with making it mandatory to publish all five key local budget documents (budget proposal, enacted budget, citizens' budget, mid-year report, and year-end report). At the same time, all stakeholders, including civil society, the media and experts, as well as citizens themselves should work to improve the budget literacy of all citizens. By improving budget transparency and involving citizens in the local budget process, local politicians have the opportunity to restore citizens' trust and improve the allocative efficiency of local budgets. Transparency and participation channels can increase citizens' sense of belonging and ownership of budgetary resources (see e.g. Ott, Mačkić & Prijaković, 2019).

Future studies may build on the present research by conducting cluster analysis for other regions in Croatia, by leveraging the existing five-year database and conducting a panel regression analysis for Croatian LGUs, exploring in more detail how women's political representation affects local budget transparency.

AGGREGATE LEVEL OF FINANCIAL REPORTING MANIPULATIONS IN COUNTRIES OF SOUTH-EAST EUROPE

ABSTRACT

Even though financial statements are one of the main sources of information for the process of decision making, managers may misuse them for maximizing their own benefits at the expense of other interest groups. Financial reporting manipulations have been subject of interest for many researchers. However, prior studies were mainly conduced in developed countries, unlike post-communists countries of South-east Europe. The aim of this paper is to analyse differences in the level of financial reporting manipulation between Southeast European countries. We assume that differences in the level of financial reporting manipulation between Southeast European countries can be explained by different regulation and taxation systems. To conduct this investigation, large and very large companies from Bosnia and Herzegovina, Croatia, Montenegro, Serbia, and Slovenia have been selected. Necessary data for empirical research is collected from the AMADEUS database. The study was conducted on a sample of 4,646 companies from 2014 to 2015. We focus on the three measures: avoidance of small losses, smoothing of operating earnings vis-a-vis cash flow and the correlation between accounting accruals and cash flow from operations to identify financial reporting manipulation. Descriptive statistics are used to summarize date and to analyze results. Our findings are consistent with stated predictions and indicate that there is a difference in the level of financial reporting manipulation between Southeast European countries. These findings contribute to the current debate on the problem of accounting manipulation.

Key words: *Financial reporting quality, Financial reporting manipulations, Southeast European countries.*

1. Introduction

Financial reporting quality represents the precision with which financial reporting communicates information about the company's operations (Biddle et al., 2009). Despite the fact that accounting regulation attempts to ensure that financial reporting consistently has high quality, growing body of accounting literature concludes that managers may misuse financial reporting process in order to maximize their own benefits at the expense of other interest groups. Communications between companies and shareholders may be deliberately distorted by the activities of financial statement preparers (managers) who wish to alter the

content of the messages being transmitted, and type of distortion is often referred to as 'earnings management'(Gowthorpe and Amat, 2005). Financial reporting manipulations arise from the presence of an agency problem, more precisely if each party to the contract acts to increase its own utility and occur because of the information asymmetry between managers and shareholders. Financial reporting manipulations represent management discretionary decisions in order to make accounting choices that may affect the transfer of wealth between companies, between the company and society, fund providers, and, finally, between the company and managers (Stolowy and Breton, 2004).

In corporate financial reporting, earnings are the single most important information from financial statements that determine the economic value of the firm and the allocation of resources in the capital market (Noor et al., 2015). Thus, earnings are usually considered to be the most frequent target of accounting manipulations (Aljinović Barać et al., 2017). Namely, managers' bonuses are often related to the reported earnings and there are many incentives and pressures that increase the risk of manipulative behaviour related to reported earnings. Financial pressures, a decline in financial performance and high expectations for financial performance growth are often cited as motives for earnings management. According to Healy and Wahlen (1999) financial reporting manipulation occurs when managers use judgment in financial reporting to alter financial reports in order to either mislead some stakeholders about the underlying economic performance of the company or to influence contractual outcomes that depend on the reported accounting practices. Because financial reporting misconduct may involve the manipulation of financial statements by a variety of economic agents in capital markets under a particular legal regime (Amiram et al., 2018), we believe that differences in the level of financial reporting manipulation between Southeast European countries exist and can be explained by different regulation and taxation systems.

Financial reporting manipulations have been subject of interest for many researchers. Research on financial reporting quality has grown dramatically over the past two decades (De Fond, 2010). Studies were mainly conduced in developed countries, unlike post-communists countries of South-east Europe. The aim of this paper is to analyse differences in the level of financial reporting manipulation between Southeast European countries. In order to conduct the empirical analysis, large and very large companies from Bosnia and Herzegovina, Croatia, Montenegro, Serbia, and Slovenia have been selected. Necessary data for empirical research is collected from the AMADEUS BvD database. The study was conducted on a sample of 4,646 companies from 2014 to 2015. Following Leuz et al. (2003) and Burgstahler et al. (2006) research methodology, we use three measures to identify financial reporting manipulations: avoidance of small losses, smoothing of operating earnings vis-a-vis cash flow and the correlation between accounting accruals and cash flow from operations. At a descriptive level, we find large differences in the level of financial reporting manipulations between Southeast European countries. Our descriptive evidence suggests that companies in countries with different regulation and taxation systems have differences in the level of financial reporting manipulation. These findings contribute to the current debate on the problem of accounting manipulations. Understanding the problem of accounting manipulation is important not only to owners of the firm, but also to accounting regulators and to other stakeholders.

The remainder of the paper is organized as follows. In Section 2 theoretical background and literature review is summarized. In section 3 research design and research methodology are explained. Research results are elaborated in Section 4 and the last section outlines the concluding remarks.

2. Financial reporting manipulation literature review

A large body of existing studies in the literature have examined various aspects of financial reporting manipulations. Our empirical research is based on aggregate earnings management measures between different countries based on Leuz et al. (2003) methodology. Leuz et al. (2003) examine systematic differences in earnings management across 31 countries. Their findings show that earnings management varies systematically across countries with different institutional characteristics. Their analysis suggests that economies with relatively dispersed ownership, strong investor protection, and large stock markets exhibit lower levels of earnings management in comparison to countries with relatively concentrated ownership, weak investor protection, and less developed stock markets. Beside Leuz et al. (2003) research, there are numerous other studies analysing different aspects of accounting manipulations and the most important papers are described in the following text.

Ball and Shivakumar (2005) point out that financial statements are economic goods and their properties, including earnings quality, are determined primarily by the economic uses to which they are put. Their interpretation is that lower earnings quality in private companies does not imply the failure of accounting or auditing standards because the difference in average earnings quality between public and private companies reflects differences in demand for financial reporting between private and public companies, and is that it is not a failure in supply. Agrawal and Chadha (2005) examine whether certain corporate governance mechanisms are related to the probability of a company restating its earnings and they find that the probability of restatement is higher in companies in which the chief executive officer belongs to the founding family in regards to companies whose boards or audit committees have an independent director with financial expertise. Farber (2005) analyses the association between the credibility of the financial reporting system and the quality of governance mechanisms and finds that fraud companies have poor governance, fewer numbers and percentages of outside board members, fewer audit committee meetings, fewer financial experts on the audit committee, a smaller percentage of Big 4 auditing firms, and a higher percentage of CEOs who are also chairmen of the board of directors.

Van Tendeloo and Vanstraelen (2005) address the question whether voluntary adoption of International Financial Reporting Standards (IFRS) is associated with lower earnings management and indicate that in general, adopters of IFRS cannot be associated with lower earnings management. Burgstahler et al. (2006) examine how institutional factors shape companies' incentives to report earnings and provide evidence that private companies exhibit higher levels of earnings management and that strong legal systems are associated with less earnings management in private and public companies. Barth et al. (2008) examine whether application of International Accounting Standards (IAS) is associated with higher accounting quality and find that companies applying IAS from 21 countries generally evidence less earnings management and that the accounting amounts of companies that apply IAS are of higher quality than those of non-U.S. companies that do not. Van Tendeloo and Vanstraelen (2008) provide evidence that privately held companies engage less in earnings management when they have a Big 4 auditor compared to a non-Big 4 auditor only in high tax alignment countries, where financial statements are more scrutinized by tax authorities and the probability that an audit failure is detected is higher.

Dechow et al. (2011) contribute to the financial reporting manipulation literature by showing that the overstatement of revenues, misstatement of expenses, and capitalizing costs are the most frequent types of misstatements. Zang (2012) shows that managers' trade-off decisions are influenced by the costs and timing of earnings and indicates that companies use more accrual-based earnings management and less real activities manipulation because real activities manipulation are more costly for them. In contrast with the results in Barth et al.

(2008), Ahmed et al. (2013) find evidence of an increase in income smoothing for IFRS companies relative to benchmark companies after mandatory IFRS adoption and suggest that their inference of improvement in accounting quality cannot be generalized to mandatory adopters. Using a database that contains accounting data for a large sample of U.S. private companies, Hope et al. (2013) analyse financial reporting quality of U.S. private versus public companies and find that in general, public companies have higher accrual quality and are more conservative. Aljinović Barać et al. (2017) examine motives, targets and techniques of accounting manipulations and show that manipulations are principally oriented towards three groups of users that are perceived to be most important potential victims of manipulations such as creditors, tax authorities and suppliers with the intention to hide bad performance, get better terms of crediting and minimize fiscal and political costs. They also find that hiding bad performance, getting better terms of crediting by banks and minimizing fiscal and political costs are perceived as main motives for manipulative actions; earnings benchmarks and leverage levels are perceived to be the most common targeted manipulation measures; write-off of accounts receivables, inventory measurement policy, depreciation policy and provisions are perceived to be the most frequent (i.e. riskier) areas of accounting manipulations. Jackson et al. (2017) indicate that the degree of earnings co-movements with the industry is in fact a causal factor in managers decisions to bias earnings reports. Gao and Zhang (2019) show that one manager manipulates more if he believes that reports of peer companies are more likely to be manipulated. According to them, as a result, one company's investment in internal controls has a positive externality on peer companies. It reduces its own manager's manipulation, which, in turn, mitigates the manipulation pressure on managers at peer companies.

Summarizing the results of the studies presented, it can be concluded that financial reporting manipulations have been subject of interest for many researchers. However, prior studies were mainly conduced in developed countries, unlike post-communists countries of Southeast Europe. This study analyses differences in the level of financial reporting manipulation between Southeast European countries and provides new perspective on accounting manipulation in a specific institutional setting.

3. Research design and research methodology

Empirical part of the research is conducted on a sample of active, large and very large companies from Bosnia and Herzegovina, Croatia, Montenegro, Serbia and Slovenia available in BvD Amadeus database in period 2014-2015. The selected sample consisted of total of 5,060 companies. In data cleaning process, 414 companies were excluded from the sample due to missing data. Therefore, a final sample consists of 4,646 companies.

Table 1 shows the distribution of companies from the sample by industry in selected countries. The table shows that the most of companies in the sample are engaged in manufacturing, wholesale and retail trade.

Table 1: Distribution of companies by industry in selected countries

Industry	Total	Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia

Source: author's calculations

In accordance with previous studies (Leuz et al., 2003; Burgstahler et al.,2006) we assume that differences in the level of financial reporting manipulation can be explained by different regulation and taxation systems. Therefore, the main research hypothesis can be expressed as: *There is a difference in the level of profit manipulation between Southeast European countries.*

In order to empirically analyse differences in the level of financial reporting manipulations between Southeast European countries we use a three measures of earnings managements according to Leuz et. (2003) and Burgstahler et al. (2006) methodology: avoidance of small losses; smoothing of operating earnings vis-a-vis cash flow; and the correlation between accounting accruals and cash flow from operations. Proxy for smoothing of operating earnings vis-a-vis cash flow is the country's median ratio of the firm-level standard deviations of operating income and operating cash flow (EM1). The cash flow from operations is equal to operating income minus accruals, where accruals are calculated as: (Δtotal current assets - Δcash) - (Δtotal current liabilities- Δshort-term debt - Δtaxes payable) - depreciation expense (Leuz et al., 2003, 509). Proxy for correlation between accounting accruals and cash flow from operations is the country's Spearman correlation of the change in accruals and the change in cash flow from operations. EM2 is the country's median ratio of the absolute value of accruals and the absolute value of the cash flow from operations (Leuz et al., 2003, 514). Proxy for avoidance of small losses is the ratio of small profits to small losses (EM3). "EM3 is the number of all profits divided by the number of small losses, and a firm-year observation is classified as small profit (small loss) if positive (negative) net income falls within rang od 1 percent of lagged total assets" (Burgstahler et al., 2006, 995).

Descriptive analysis is used to provide information regarding measures of central tendency and measures of variability for each variable in the research model. The main variables used

in the analysis are: EBIT - earnings before interest and taxes; ACC – total accruals and CFO - cash flow from operating activities.

EBIT is calculated as earnings before interest and taxes in 2015 divided by total assets in 2014. Table 2 provides descriptive statistics for variable EBIT.

Table 2: Descriptive statistics for variable EBIT/total assets

	Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
Average	0,2128	0,2709	0,0059	0,4677	0,0770
Median	0,0134	0,0390	0,0054	0,0451	0,0530
Std. Deviation	3,7214	7,1024	0,3741	14,5571	0,1391
Minimum	-0,3951	-1,4494	-5,1687	-1,0411	-0,7746
Maximum	86,2879	268,7321	1,5980	555,2411	2,5554
Upper quartile	0,0806	0,0947	0,0430	0,1112	0,1079
Lower quartile	-0,0160	0,0025	-0,0223	-0,0014	0,0216
Number of companies	538	1446	245	1456	961

Source: author's calculations

Table 2 shows that the average and median value of EBIT are positive in all countries. Both values are the lowest in Montenegro, with the highest average in Serbia and the median in Slovenia. The standard deviation from EBIT average is the largest in Serbia. The upper quartile is the largest in Serbia, which means that 75% of companies in Serbia have an average EBIT of 0.11 or less, and the smallest lower quartile is in Montenegro, which means that 25% of the sample companies have EBIT of -0.02 or less. Therefore, according to these values, the highest EBIT is achieved by companies in Serbia and Slovenia, and the lowest in Montenegro.

Variable ACC (total acccruals) is calculated as:

ACC = (Δtotal current assets) - Δcash - (Δtotal current liabilities- Δshort-term debt - Δtaxes payable) - depreciation expense.   (1)

Variable ACC is calculated for year 2015 and scaled with total assets from previous year. Table 3 provides descriptive statistics for variable ACC.

Table 3: Descriptive statistics for variable ACC/total assets

	Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
Average	-0,6196	-0,1029	0,2988	0,3572	-0,0403
Median	-0,0191	-0,0421	-0,0229	-0,0278	-0,0430
Std. Deviation	13,1734	8,0973	5,1322	10,6307	0,1459
Minimum	-305,4539	-250,0508	-1,5495	-2,7798	-0,9097
Maximum	1,0440	177,6402	80,3774	396,6115	1,3503
Upper quartile	0,0166	0,0116	0,0037	0,0369	0,0117
Lower quartile	-0,0723	-0,1065	-0,0807	-0,0940	-0,1011
Number of companies	538	1446	245	1456	961

Source: author's calculations

Lower absolute values of ACC are usually considered to imply higher financial reporting quality. Accruals are managers' subjective estimates of future outcomes and therefore they are inherently more uncertain than cash flows (Aljinović Barać et al., 2011.). Also, Jones et al. (2008) find that total accruals are likely to be associated with manipulative actions and fraud. Table 3 shows that both the average and the median are negative for most countries.

According to the average values of ACC's share in total assets, it turns out that Slovenia has the best financial reporting quality and Bosnia and Herzegovina the worst. On the other hand, the median value for Bosnia and Herzegovina has the lowest absolute value implying high financial reporting quality.

Variable CFO (cash flow from operating activities) represents the difference between all items of cash receipts and cash expenses from regular business activities. However, this data was not available in Amadeus BvD base, so it was calculated as net income minus total accruals and divided by total assets in previous year.

Table 4 provides descriptive statistics for variable CFO.

Table 4: Descriptive statistics for variable CFO/total assets

	Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
Average	0,7752	0,2603	-0,3101	0,0216	0,1024
Median	0,0337	0,0690	0,0229	0,0570	0,0874
Std. Deviation	15,7644	11,1150	5,5477	3,1299	0,1854
Minimum	-0,9815	-158,5942	-86,8932	-64,6232	-1,2900
Maximum	365,5043	391,0226	1,4969	64,6332	3,0352
Upper quartile	0,1104	0,1575	0,0869	0,1400	0,1634
Lower quartile	-0,0094	0,0098	-0,0122	-0,0111	0,0307
Number of companies	538	1446	245	1456	961

Source: author's calculations

Table 4 shows that the average share of CFOs in total assets is the highest in Bosnia and Herzegovina and the lowest in Montenegro. However, Bosnia and Herzegovina also has the largest standard deviation from the average value, so the average is not a representative measure. The median is highest in Slovenia, and the lowest again in Montenegro.

4. Research results

After descriptive analysis, financial reporting manipulations indicators are calculated (EM1, EM2 and EM3).

The EM1 indicator is calculated as the ratio of the standard deviation of EBIT and the cash flow from operating activities (both scaled with total assets from the previous year). First, EBIT and CFO's share of total assets are calculated for each company in the sample and then we computed standard deviations on a country level. According to Leuz et al. (2003) smaller value of EM 1 indicator implies less accounting manipulations, and vice versa. Namely, a low value of this measure, ceteris paribus, indicates managers' exercise of accounting discretion to smooth reported earnings (Leuz et al., 2003). Table 5 shows values of EM1 indicator across countries. Results indicate that the level of financial reporting quality is the highest in Serbia (i.e. the lowest level of accounting manipulations).

Table 5: EM1 indicators by country

EM 1				
Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
0,2361	0,6390	0,0674	5,2378	0,7503

Source: author's calculations

Beside manipulating by smoothing performance measures, managers can also overstate reported earnings to achieve certain earnings targets or report an extraordinary performance

(Leuz et al., 2003). The EM2 indicator is calculated as the median ratio of the absolute values of the ACC and the absolute values of the CFO. First, the absolute values for each company are calculated and then the median ratio of these two variables for each country separately. According to Leuz et al. (2003) methodology, the higher value of EM2 indicator implies more accounting manipulations, and vice versa. Table 6 shows that accounting manipulations are the least in Slovenia and the largest in Montenegro.

Table 6: EM2 indicators by country

EM 3				
Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
0,8486	0,8700	0,9688	0,8241	0,7202

Source: author's calculations

Managers often use their discretion to avoid reporting small losses (Degeorge et al., 1999, Burgstahler and Dichev, 1997). Namely, small losses are likely to lie within the bounds of managers' discretion, so managers can avoid them at relatively low cost. Therefore, in each country, the ratio of small reported profits to small reported losses reflects the extent to which managers exercise discretion to avoid reporting losses. (Leuz et al., 2003). The EM3 indicator is calculated as the ratio of the number of companies with small gains and small losses for each country. First, we divided net income with total assets from previous year for each company. If the calculated value falls into the range [0, 0.1] then it is labelled as a small gain, and if it is in the range [-0.01, 0] then it is a small loss. The higher value of EM3 indicator implies more accounting manipulations, and vice versa (Leuz et al., 2003). Table 7 shows that the least accounting manipulations are in Bosnia and Herzegovina, and the most in Slovenia.

Table 7: EM3 indicators by country

EM 4				
Bosnia and Herzegovina	Croatia	Montenegro	Serbia	Slovenia
0,9623	3,4203	1,0370	1,2105	3,8929

Source: author's calculations

To summarize, the results of the empirical analysis are not consistent for each accounting manipulations indicator and indicate different conclusion for each country. Namely, according to EM1 indicator, Serbian companies have the highest financial reporting quality (i.e. the lowest level of accounting manipulations). Indicator EM2 implies that companies from Slovenia have the highest level of financial reporting quality and according to EM3 companies from Bosnia and Herzegovina have the highest reporting quality. Beside that, results also show significant differences in values of accounting manipulations indicators across countries in south-east Europe, as we predicted.

Although results should contribute to the existing academic literature, there are few major limitations of the study. First, the paper remains mainly descriptive because it examines differences in the level of financial reporting manipulation between Southeast European countries, but does not attempt to identify the reasons which cause those differences. Second, due to the fact that each indicator is calculated on a country level we are not able to statistically test differences between countries. Even with these considerations in mind, valuable and useful information about differences in accounting manipulations between countries in south-east Europe are provided.

5. Conclusion

This study extends the existing literature on financial reporting manipulation in several ways. First, it highlights the importance of institutional factors and their impact on financial reporting quality. Second, prior studies were mainly conduced in developed countries, unlike post-communists countries of South-east Europe.

To examine differences in the level of financial reporting manipulations between Southeast European countries we used the data from the Bureau Van Dijk Amadeus database. We focus on three measures of accounting manipulations: avoidance of small losses; smoothing of operating earnings vis-a-vis cash flow; and the magnitude of accruals; as dimensions of financial reporting manipulations. We find for large and very large companies from Bosnia and Herzegovina, Croatia, Montenegro, Serbia, and Slovenia that companies in countries with different regulation and taxation systems have differences in the level of financial reporting manipulations. These findings contribute to the current debate on the problem of accounting manipulations. We note that our study has several limitations. Perhaps most importantly, our study remains mainly descriptive, so the future research should analyse causes that make the differences in financial reporting manipulations between countries with different regulation.

Finally, our analysis provides useful insights to researchers, regulators, and other financial statement users regarding the financial reporting quality. By better understanding financial reporting quality, financial statement users should be in a better position to identify the precision with which financial reporting system communicates information about the company's operations.

CROATIAN BANKING AND INSURANCE INDUSTRY: OVERVIEW OF COST EFFICIENCY PERFORMANCE AFTER ACCESSION TO THE EUROPEAN UNION

ABSTRACT

This paper analyses Croatian banking and insurance industry cost efficiency in the period just before and after Croatia's accession to the European Union. The objective of this research is to determine the existence of interdependence between the results of different efficiency measurement approaches and in various financial industry areas. For that purpose, efficiency is measured by using Data Envelopment Analysis (DEA) methodology. DEA is a specific nonparametric linear programming methodology used for testing the efficiency in numerous areas, including the financial sector. In this research, the main focus is on the banking and insurance sectors as holders of 75% of the total assets of the Croatian financial industry. In that sense, the main purpose of this research is to obtain a more precise conclusion about the efficiency of the Croatian financial industry in the period following the accession of the Republic of Croatia to the European Union in 2013 and determine how this fact consequently impacted said efficiency. For banks, expenses as input data and income as output data are used; for insurance companies, claims incurred, net operating expenses, and investment costs are used as input data in addition to earned premiums and investment income data as output data. The analysis is conducted on pooled data for the period from 2012 to 2018 on the sample of Croatian banks and insurance companies operating within it. However, the period observed was somewhat challenging in doing business and business performance, as well as in many other ways, due to the fact that Croatia experienced a prolonged recession in the period following the onset of the latest financial crisis of 2008. Consequently, research results obtained herein could be a valuable source of information for better understanding of business performance in the financial sector in times of dynamic and unstable financial or macroeconomic environment, simultaneously with changing legal and other conditions.

Key words: *Croatia, banking industry, insurance industry, efficiency, data envelopment analysis*

1. Introduction

Financial institutions, in general, are continuously seeking to perform more efficiently and, for that purpose, are constantly trying to improve their business strategies in order to achieve the efficiency desired. However, financial institutions also operate in a very competitive, unstable, and constantly changing macroeconomic, financial, and legal environment. Consequently, it is

rather challenging for them to operate more efficiently under such conditions. For that reason, it is essential to test and measure their efficiency in order to keep track and compare their business performance with that of other financial institutions. For that purpose, efficiency can be, and is, measured and followed, for example, on the level of the banking industry, insurance industry, pension sector, etc. In that sense, a number of different parametric and non-parametric methods or approaches can be applied for efficiency assessment. The most common approach for business performance efficiency measurement in the banking industry is the calculation of different financial (accounting) indicators. Nevertheless, this approach measures efficiency for a specific unit in a given period of time and does not take into calculation external environment impact (eg. competition), nor does it calculate efficiency by taking into consideration how a particular unit performs in comparison to the other(s) closest competition. Consequently, in such an approach, the efficiency results provide only the information about the level of efficiency for a specific unit (for example, bank branch, bank group, country banking industry), without providing information about business performance efficiency in comparison to that of other units. For the purpose of testing efficiency more realistically, but somewhat differently, data envelopment analysis (and DEA models) is used as a specific mathematical non-parametric method. It takes into consideration other units, and its results actually give us insight into how each Decision Making Unit (DMU) is efficient in comparison to the other DMUs (competition) included in such an analysis. Some of the previous studies on the topic of efficiency measurement in banking (Tuškan and Stojanović, 2016) and in banking together with insurance industry (Jurčević and Mihelja Žaja, 2013) obtained results that suggested and highlighted the possibility of early detection or signs of macroeconomic or financial instability in the business environment. This is indicated as the main advantage of the DEA approach in efficiency measurement when compared to, for example, the accounting or other financial indicators calculation approach. Lag detected in the efficiency result is an important signal to financial institutions management, encouraging the usage of different approaches in efficiency testing for getting more precise and more realistic results. Such testing could help the institutions in making better decisions – namely, that they accommodate in time and choose the best appropriate adaptation of their business strategies to the newly created circumstances in their business environment at a time when many factors influence and create very specific and challenging business performance conditions. Precisely that was the case with the Republic of Croatia after its the accession to the European Union (2013) since the previous period was characterised by many connected legal adaptations (for banks: Law on Credit institutions, 2009; implementation of Basel III rules, etc.) in addition to all of the economic, social, and financial consequences of prolonged recession duration in the period after the onset of the last financial crisis of 2008. Consequently, many changes occurred in the Croatian financial sector. Those changes were particularly significant in the banking sector, according to a stronger decrease in the number of banks operating, a consequence of emphasised M&A or bankruptcy (less) activities in the last decade. The accession to the European Union impacted the insurance industry more conspicuously since it marked the beginning of the liberalization of the insurance market. Although the legal provision, i.e. the deregulation of conditions and tariffs, came into force on January 1, 2008, real liberalization took place in 2013. Liberalization of the insurance market enables insurers to do business on a market basis, respecting individual approach to risk and a more equitable determination of premiums for policyholders. The possibility of new companies entering is open on the liberalized market, thereby further stimulating the price competition between insurers. This type of regulation may allow for lower premiums, but such that it will not impair the stability of the insurance companies themselves. Furthermore, in 2016 the Solvency II, a Legislative and Regulatory Framework for insurance companies, came into force. Solvency II has endorsed new, firmer rules for solvency, risk management, and risk-based monitoring processes, as well as a new way of reporting and disclosing. All of these

changes are implemented in order to protect the insured, i.e. the beneficiaries of insurance, and to prevent instability in the insurance market. In that sense, a more detailed analysis of business performance efficiency would provide information about what was happening with business strategies of DMUs and whether they were competitive in such circumstances.

The main goal of this research is to reach a more precise conclusion about the business performance of the Croatian financial sector and how different changes, such as macroeconomic, financial, legal, etc., affect its business performance efficiency results. For that purpose, efficiency is measured by using DEA methodology in the banking and insurance sector as carriers of Croatian financial sector with a joint share of 75% in the total asset. Efficiency is tested for the period from 2012 to 2018 on pooled data and the sample of Croatian banks and insurance companies operating during that period. The results of this research can be a valuable source of information not only for the scientific community and future researchers but also for the professional community: primarily banks' and insurance companies' management, in addition to all of the other financial institutions. Research results can help management (managers) in the financial sector in creating better business strategies by taking into consideration and comparing the different efficiency testing results, but also by encouraging them to use different analytical tools and approaches for efficiency testing in order to make more precise decisions regarding business performance. Research results could help financial sector supervisors as well, not only in improving the supervision of subjects' business performance but also in the part of a more precise macroeconomic and financial movements forecast and analysis. Precise macroeconomic and financial movements forecasting results are an important base for governments in the creation of a quality and the properly directed economic policy.

This paper consists of six parts. After the Introduction, its second part presents a literature overview. The third part includes insight into the Croatian banking and insurance industry. Methodology and data are explained in the fourth part, whereas empirical research results are given in the fifth part. The last section presents the conclusion.

2. Literature overview

Data envelopment analysis (DEA) efficiency measurement approach has been usually and extensively used to assess the efficiency of schools, hospitals, public sector, and not-for-profit institutions, financial institutions, etc. Charnes et al., 1978, were the first to describe DEA efficiency measurement approach and apply a mathematical planning model (Charnes-Cooper-Rhodes [CCR] model) to measure efficiency frontier based on the concept of Pareto optimum and on the basis of Farrell assumptions (1957) in the part of productive efficiency measurement. This approach considers, for example, how much the total efficiency in the financial sector can be improved and ranks the efficiency scores of decision-making units (DMUs). The DMUs are usually described by several inputs that are spent on the production of several outputs. DEA efficiency measurement derives from analyzing empirical observations obtained from DMUs to define productive units, which are characterized by common multiple outputs and common designated inputs (Charnes et al., 1978). DEA is most useful in cases where accounting and financial ratios are of little value, multiple outputs are produced through the transformation of multiple inputs, and the input-output transformation relationships are unknown (Charnes et al., 1978).

Studies dealing with DEA are mostly centered on deriving a summary measure of the efficiency of each unit, on estimating targets of performance for the unit, and on identifying role-model

units of good operating practice. Additional uses for DEA in banking include the measurement of efficiency in light of resource and output prices, the estimation of operating budgets that are conducive to efficiency, the assessment of financial risk at bank-branch level, and the measurement of the impact of managerial change initiatives on productivity (Thanassoulis, 2001).

As a specific mathematical non-parametric, linear-programming-based method for assessing the performance of homogeneous organizational units, DEA was increasingly being used worldwide mainly in banking, but also, more recently, in the rest of the financial industry (Emrouznejad, Yang, 2018). In that sense, the unit of assessment, or decision making unit, for example in banking industry efficiency testing by using DEA, is usually the bank branch, but it can be a bank at the national level or the banking industry (banking groups) at the level of some union, etc. In the financial sector, DEA has therefore been widely used in banking industry efficiency measurement. However, this approach has also been used increasingly more often in other efficiency testing of financial institutions, especially for the insurance industry; more recently, it was applied to efficiency measurement of pension and investment funds, etc. Consequently, many among the research, scientific, and professional papers were written in many of the abovementioned areas of application by using only the DEA efficiency measurement models, or by combining them with another approach to efficiency measurement. This paper analyses the efficiency of the financial industry in the Republic of Croatia: several research papers have been written by using DEA approach in this part. For the Republic of Croatia, the efficiency of banks was investigated by using the DEA approach, for example, by Neralić, 1996; Jemrić and Vujčić, 2002; Jurčević and Mihelja Žaja, 2013, Tuškan and Stojanović, 2016. On the other hand, the DEA efficiency measurement approach in the Croatian insurance industry was applied by Davosir Pongrac, 2006; Jurčević and Mihelja Žaja, 2013; Mihelja Žaja and others, 2018, etc. Example of DEA application to efficiency measurement of the Croatian mandatory pension funds can be found in the research paper by Olgić Draženović and others, 2019. Gardijan and Krišto, 2017, give an overview of the efficiency of mutual funds in Croatia. What follows in this paper is a more detailed literature overview of the abovementioned research papers.

The results of Croatian banking industry efficiency testing by using DEA approach for the period between 1995 and 2000 suggest that smaller banks are globally efficient, yet large banks are locally efficient; foreign-owned banks are the most efficient on average, whereas new banks are more efficient than old ones. The rehabilitation process in the large state-owned banks improved their efficiency, but also contributed to a substantial decrease in the interest rate spreads, and thus a more competitive environment in the banking market. Greater macroeconomic stability and competition in the banking sector from foreign banks' entry promote cost efficiency, as does the development of the supportive institutions (Jemrić and Vujčić, 2002, 17).

Besides the DEA approach, the most common approach used for measuring the financial institutions' efficiency deals with ratio analysis among several financial institutions by using numerous accounting ratios. The ratio analysis approach can measure the overall financial soundness of the financial institutions and the operating efficiency of its management (Jurčević and Mihelja Žaja, 2013). In that sense, accounting ratios assure valuable information about the performance of financial institutions when compared to previous periods. However, the weakness of ratio analysis is the lack of agreement on the relative importance of various types of input and output. A bank may appear to be performing well even if it is being poorly managed on some of these dimensions as long as it compensates by performing particularly well on other

dimensions (Neralić, 1996). Furthermore, the accounting ratios fail to observe more outputs with more inputs and fail to consider the value of management actions and investment decisions that will affect the future, as opposed to current performance (Neralić, 1996). The main difference in results between accounting ratio approach and DEA approaches in case of the Republic of Croatia and efficiency measurement of banks and insurance companies for the period 2005 – 2010 was noted in the sense of accounting approach efficiency measurement scores lag after 2008, i.e. after the onset of the last financial crisis: DEA efficiency scores had the lowest values in the year 2007 for insurance industry and in 2008 for banks, but with visible lower values already in 2007 when to previous years, whereas accounting ratios had the lowest values in 2009 (Jurčević and Mihelja Žaja, 2013). For that reason, use of DEA is recommended in addition to, or complemented by, the accounting ratios in efficiency measurement for a more realistic conclusion about financial institutions' business performance.

DMUs can, however, be banks or other financial institutions in some country, as well as banking or other financial industries (or chosen banks) in the region, union, etc. In that sense, some of the studies were dealing with the banking or insurance industry on a country level as DMUs. For example, in Tuškan and Stojanović (2016), efficiency of the European banking industry was analyzed on the sample of 28 European banking systems as DMUs (including Croatian) by using different efficiency measurement approaches, namely that with accounting ratios, and another with DEA approach. Comparison of results gained in that research suggested a lag of average accounting indicators (particularly Return On Assets – ROA, and Return On Equity – ROE) over the results of DEA window analysis efficiency measurement approach. The conclusion of this research suggested DEA as a desirable alternative, or a complementary analytical tool, in the detection of early signs of inadequate business strategies, which may lead to a slowdown of business activity or poorer efficiency results. As a tool, research suggested that DEA could also be important in times of unstable financial or macroeconomic environment because it can help in the detection of early signs of crisis, earlier than accounting indicators.

In their recent research of insurance industry Mihelja Žaja and others (2018) evaluated the performance of the insurance industry in selected member states of the European Union for the period from 2004 to 2017. The main conclusions of their analysis were that business efficiency in the insurance markets has been declining in the observed period; the financial crisis affected the result of efficiency, given the interconnectedness of insurance and financial markets, however, markets managed to recover; a significant drop in efficiency occurred between 2011 and 2013; the country-by-country efficiency analysis showed that fourteen among 26 countries analyzed were above the average efficiency score.

DEA efficiency measurement approach used in the examination of the performance of mandatory pension funds in the Republic of Croatia gave results which suggest that among 12 mandatory pension funds only five achieved scale efficiency for the period from 2015 to 2018, meaning that they operated at a maximum score in 2015 (Olgić Draženović and others, 2019, 92). The results of DEA efficiency testing of mutual funds in Croatia suggest that DEA is useful for performance testing of UCITS funds and complements traditional measures. The paper contributes to the development of the adjusted DPEI index. Analysis indicated that the efficiency of UCITS funds changed across the three analyzed periods: the efficient funds in the pre-crisis period are primarily stock and money market funds, those dominating in the period of the financial crisis are money market funds – as expected; whereas in the post-crisis period no type of UCITS funds shows a clear dominance (Gardijan and Krišto, 2017, 90).

3. Insight into Croatian banking and insurance industry

The last decade in the financial and macroeconomic environment was somewhat challenging on many levels for both business performance and doing business in general, not only in the Republic of Croatia as the newest member state but also in the rest of the EU. Such a situation of instability was mainly caused by the financial crisis, but also by some political changes and decisions. However, the Republic of Croatia experienced a more prolonged recession duration in the period after the onset of the last financial crisis of 2008 – all until 2015. This resulted in many changes in the financial sector as well as in the total economy. The main changes in the banking sector as the main part of the Croatian financial sector, since it takes about 68% (HRK 409 billion at the end of 2018; CNB, 2019 b) of total financial sector assets worth more than HRK 600 billion (Table 1), were observed in the sense of stronger decline in the number of banks, mainly as a consequence of M&A activities or bankruptcy, and after a longer idle period in the sense of conglomeration in banking sector (Appendix 1).

Table 1: Relative importance of financial institutions in Croatia

	2017		2018	
	Asset, in HRK million	Share	Asset, in HRK million	Share
Commercial banks	401,148	68.44%	408,667	67.62%
Obligatory pension funds	91,925	15.68%	98,126	16.24%
Insurance companies	40,838	6.97%	41,936	6.94%
Leasing	18,150	3.10%	19,531	3.23%
UCITS investment funds	18,500	3.16%	19,117	3.16%
Saving banks	7,728	1.32%	5,454	0.90%
Voluntary pension funds	4,745	0.81%	5,139	0.85%
Alternative investment funds	3,076	0.52%	3,280	0.62%
TOTAL	586,110	100,00%	601,698	100%

Source: Croatian Insurance Bureau (CIB) (2019): Insurance Market in the Republic of Croatia 2018: Key Facts

This situation can be explained by deteriorated credit portfolio quality in the period after the onset of the last financial crisis. The share of non-performing loans (NPL) (loans in B and C risk groups) increased to 14% until 2012, with the highest level reached in 2014 (17.1%), but this was followed by another decrease in acceptable or manageable levels (under 10%) after 2017 (CNB, 2019 c). Many efforts were made in the direction of the (quality) capital increase and balance "cleaning" process in order to satisfy new, stricter regulatory rules that membership in the EU brought in this part to Croatia as well. Additionally, banks in Croatia have a specific owner structure: over 90% of the banking sector asset is foreign-owned. However, a high level of concentration (Table 2) is also present within the banking sector: 2 largest banks take part of 48%, with 4 largest banks taking even 73.4% of the asset according to data for 2018 (CNB, 2019 c). Despite a significant decrease in a number of banks operating in the Republic of Croatia during the last decade, there still remains a large number of banks in comparison to both country and population size, and most of them are small banks (with asset size under HRK 5 billion, or less than 1% share in total banking sector asset). Thirty-one banks operated at the end of 2012 in Croatia, while this number decreased to 21 until the end of 2018 (CNB, 2019 c). The expansionary monetary policy resulted in the all-time high HRK liquidity surplus (i.e. free reserves in banks' accounts), averaged HRK 30 billion in 2018, which was twice as much as in 2016 and fourteen times the amount recorded in 2008, the year preceding the crisis (CNB, 2018; EBF, 2019). The rising surplus of liquidity in the financial system has focused on the competition between banks on lending and contributed to the decline in interest rates. At the same time, their dependence on cross-border financing decreased, leading to a drop in exposure to systemic risks. The banking system continued to accumulate significant capital surpluses as

well, as a result of the continuous supervision of the banks' operations by the Croatian National Bank and further strengthening the resilience of the system (CNB, 2018; EBF, 2019). Consequently, capitalization and capacity to absorb potential losses remained very high: capital ratio in total improved from nearly 21% in 2012 to over 23% in 2018 (CNB, 2019 c).

After five years of decline, bank assets slightly increased in 2017. Bank assets decreased from 2012 onwards, primarily due to the absence of credit growth and continued bank deleveraging, particularly vis-à-vis majority foreign owners, and in 2015 under the additional influence of the increased sale of placements and regulations on the conversion of loans in Swiss francs into loans in euros, which also had a stronger negative impact on banks' income statement values (due to the high expenses on value adjustments and loss provisions) and connected accounting profitability indicators (Return on Average Assets: ROAA and Return on Average Equity: ROAE) for that year (Table 2). Slight recovery of ROAA and ROAE in the post-crisis period after 2010 was followed by a stronger decrease in the period 2013-2015 in both values regarding abovementioned deteriorated asset quality: the growth in expenses on loss provisions sharply reduced banks' business performance; in 2013 the profit (before taxes) decreased by almost 70%, while ROAA and ROAE fell to their lowest level since 1998. From 2016 onwards, better results had been achieved, and at the end of 2018, ROAA value was at an acceptable 1.4%, while ROAE was at 8.5%. After being burdened by expenses related to the credit risk of the Agrokor Group in 2017 due to the difficulties in the business operations, bank profits recovered again in 2018 (Table 2). Bank cost-efficiency measured by the cost-to-income ratio (CIR), a ratio between general operating expenses and operating income, additionally improved in 2015 and onwards (Table 2), primarily under a strong influence of rising operating income.

Table 2: Financial indicators for Croatian banking and insurance industry in the period 2012-2018

	2012	2013	2014	2015	2016	2017	2018
Banking industry							
Total no. of banks	31	30	28	28	26	25	21
Concentration index 2 (4)	43.3 (66.9)	43.4 (66.8)	43.5 (66.6)	44.7 (67.6)	45.7 (68.2)	45.5 (68.1)	48.0 (73.4)
ROAA (%)	0.8	0.2	0.5	-1.3	1.6	1.0	1.4
ROAE (%)	4.8	0.8	2.8	-8.8	9.6	5.9	8.5
CIR (%)	51.8	52.0	51.3	51.7	45.0	46.7	47.8
Interest rate spread (%)	2.4	2.4	2.5	2.6	2.8	2.9	2.5
Capital ratio	20.9	21.0	21.8	20.9	22.9	23.8	23.1
Total asset, million HRK	399,900	397,900	395,200	393,400	388,700	391,300	408,700
Profit before taxes, million HRK	3,391	695	2,068	-5,032	6,171	3,905	5,597

Source: Authors' calculation and CNB and CFSSA official data

The analysed period was rather challenging for insurance companies, as it was characterized by the liberalization of the motor third-party liability insurance market, the introduction of the Solvency II regulatory framework, and the dynamization of the market under the influence of cost-efficiency and privatization processes. The Republic of Croatia joined the EU, and the insurance market liberalized at that time; however, the real consequences became visible only in 2014, when the most significant drop in premiums since the beginning of the financial and economic crisis in the Republic of Croatia was recorded. The share of the gross written premium (GWP) of property and liability insurance in the total premium is 75% on average, which is why the fall in the cost of motor liability insurance has had such a significant impact on the total premium. The decline in GWP continued over the next three years, with market recovery and growth in gross premium written since 2017. In 2018, there was an 8.8% annual growth in gross premium written, driven by growth, and the property and liability insurance market, the highest growth rate since 2007. The negative trend of other indicators of the insurance market since 2014, namely insurance density, insurance penetration, combined ratio, ROE, and ROA, shows how much impact the liberalization process has had on the business of the insurer. However, insurers' asset in the financial sector was growing slowly but steadily. The assets of Croatian insurers in 2012 amounted to HRK 34.1 billion, while at the end of 2018, they amounted to HRK 41.9 billion. The next major change, if not the biggest, in the insurance market in the Republic of Croatia, occurred in 2016 in relation to the introduction of a new regulatory framework for the business of insurance and reinsurance companies based on the Solvency II Directive. This framework has made significant changes for companies in the calculation of capital requirements, which includes the valuation of assets and liabilities, the calculation of technical provisions, the determination of own funds, and the calculation of Solvency Capital Requirement (SCR) and Minimum Capital Requirement (MCR). SCR is the level of capital that enables the insurance company or the reinsurance company to absorb almost all of the adverse events and solvent business with respect to the risks assumed. An MCR represents the lowest permissible level of capital of a company below which policyholders and beneficiaries, when allowed to do business, would be exposed to an unacceptable level of risk (CFSSA, 2016). According to 2016 data (Table 2), it can be seen that insurance companies are satisfactorily capitalized with relatively stable solvency ratios, with the median solvency ratio of insurance companies well above the regulatory minimum for all groups of insurers. With the introduction of the new regulatory framework, Solvency II increased the data coverage and complexity of the reports that insurance companies are required to produce and submit to CFSSA. As a result of market liberalization, growing regulatory requirements, and the consequent increase in costs in recent years, more mergers of insurance and reinsurance companies headquartered in the Republic of Croatia have been carried out. There is a significant decrease in the number of insurance companies, numbering 28 in 2012, compared to 18 at the end of 2018.

4. Methodology and data

There are a few common approaches to measure the efficiency of financial institutions. The most straightforward approach is financial ratio analysis trough the calculation of accounting indicators. The second is a parametric programming approach that is generally concerned with the production or expense function base and used to estimate the characteristics of the function and measures economies of scale while assuming all DMUs are operating efficiently. The third approach, DEA, uses DMUs efficiency frontiers to construct measures of efficiency and is labeled as a non-parametric programming approach, which considers the degree to which total efficiency in the financial sector can be improved, and ranks the efficiency scores of DMUs. This efficiency measurement approach is derived from analysing empirical observations

obtained from DMUs for defining productive units, which are characterised by typical multiple outputs and commonly designated inputs. (Tuškan, Stojanović, 2016)

DEA is chosen as a method for analysis in this paper since it deals with the DMUs efficiency ranking and takes into consideration their performance depending on income statement main data groups (variables) used as inputs and outputs. The attention to variable selection is crucial since the higher the number of input and output variables, the less constrained are the model weights assigned to the inputs and outputs, and the less discerning are the DEA results (Jenkins and Anderson, 2003). Since the total number of input and output variables in the DEA model should be no more than one-third the number of DMUs, several methods have been proposed to limit the number of variables: the analysis of correlation among the variables, the analysis of change in the efficiencies as variables are added and removed from the DEA models, limiting the number of variables relative to the number of DMUs, etc. (Wagner, Shimshak, 2007). Variables used in this paper are chosen, taking into consideration that they reflect realistically the total business performance of DMUs. Therefore, the main income statements data groups: expenses snd income (for banks: interest, non-interest, and other expenses and income; for insurance companies: net operating costs, investment cost, claims incurred, earned premiums and investment income) are chosen to be used as inputs and outputs in chosen DEA model, since they have the most significant impact on the total profit as simple accounting indicator of efficiency performance. We used a super-efficiency DEA model on pooled data for 183 observations for banks and 112 observations for insurance companies and estimated the efficiency scores relative to all 183 i.e., 112 referent observations (i.e., the efficiency scores are relative to a pooled frontier).

Different DEA models result in different types of efficiency. Standard DEA models include CCR (Charnes, Cooper and Rhodes) model assumes constant returns to scale (CRS) and, gives global technical efficiency as a result; BCC (Banker, Charnes and Cooper) model assumes variable returns to scale (VRS) and result in pure local technical efficiency; the window analysis model as more specific due to analysis of panel data which is used for examination of changes in the efficiencies of a set of DMUs over time, etc. (Cooper et al., 2006; Banker at al., 1984).

The efficiency score in standard DEA models is limited to unity (100%). Nevertheless, the number of efficient units identified by DEA models and reaching the maximum efficiency score 100% can be relatively high; especially in problems with a small number of decision making units, the efficient set can contain almost all of the units. It is very important to have a tool for diversification and classification of efficient units in such cases: that is why several DEA models for classification of efficient units were formulated. In these models, the efficient scores of inefficient units remain lower than 100%, but the efficiency score for efficient units can be higher than 100%. Thus the efficiency score can be taken as a basis for a complete ranking of efficient units. The DEA models that relax the condition for unit efficiency are called super-efficiency models. The super-efficiency models are always based on removing the evaluated efficient unit from the set of units. This removal leads to the modification of the efficient frontier, whereas super-efficiency is measured as a distance between the evaluated unit and unit on the new efficient frontier (DMU*) (Jablonský, 2006).

The first super-efficiency DEA model (input-oriented formulation, which is very close to the standard input-oriented formulation of the CCR input-oriented model) was formulated by Andersen and Petersen (1993). Tone (2001) proposed a slack based measure of efficiency (SBM model) that was the basis for the formulation of the super-efficiency SBM model (Tone, 2002), formulated as

follows:

minimize

$$\rho = \frac{1 - \frac{1}{m}\sum_{i=1}^{m} s_i^- / x_{iq}}{1 + \frac{1}{r}\sum_{i=1}^{r} s_i^+ / y_{iq}}$$

$$\sum_{j=1}^{n} x_{ij}\lambda_j + s_i^- = x_{iq}, \qquad i = 1,2,\dots,m$$

subject to

$$\sum_{j=1}^{n} y_{ij}\lambda_j - s_i^+ = y_{iq}, \qquad i = 1,2,\dots,r$$

$$\lambda, s^+, s^- \geq 0$$

The formulation shows that the SBM model is non-radial and deals directly with slack variables. The model returns efficiency score between 0 and 1 and is equal to 1 if and only if the DMU_q is on the efficient frontier without any slacks. The formulation of a super-efficiency SBM model with fractional objective function can be simply transformed into a standard problem with the linear objective function, which is not exactly a model with the linear objective function, but it can be simply re-formulated as a standard LP problem by means of Charnes-Cooper transformation (Jablonský, 2006).

For the purpose of this research and for abovementioned reasons, in order to get information for a more precise and realistic conclusion about Croatian financial industry business performance, the analysis that follows is undertaken exactly by using DEA methodology super-efficiency SBM model (output-oriented, variable returns to scale), applied on pooled data for banking and insurance sectors separately and by using software package DEA-Solver-Pro.

Different financial institutions operate according to different business models. Banks, for example, traditionally operate according to the lending trough the deposit-funding model if their balance is observed. On the other hand, insurance companies predominantly finance themselves through collecting the insurance premiums, and most of the funds are allocated in different types of money and securities investments. For that reason, inputs and outputs used in DEA models for the purpose of efficiency testing are different for the banking sector in comparison to the insurance industry. Since Croatian banking sector experienced many changes in the number of banks due to M&A activities and failures, but consequently also changes in the owner structure in observed period 2012-2018, all of the changes were anticipated and, for the purpose of analysis, all the banks in all of the years in which they operated were taken into consideration. In that sense, the sample for the banking sector includes 30 banks in total, and that means 183 DMUs. For the purpose of efficiency estimation, all input and output data were taken from banks' income statements available in Banks Bulletins (Croatian National Bank, different editions). For each j-th DMU (i.e. for each bank in each year in an observed period in which they operated) the input data (x_{ij}) include:

  Input 1, (x_{1j}) → interest expenses
  Input 2, (x_{2j}) → non-interest expenses
  Input 3, (x_{3j}) → other expenses (labour-related and capital-related administrative expenses and other expenses from the bank's business activity).
Output data (y_{ij}) include:
  Output 1, (y_{1j}) → interest incomes
  Output 2, (y_{2j}) → non-interest incomes

Output 3, (y_{3j}) → other incomes from business activity.

The main business activity of banks assumes collection of deposits, lending transactions and payment operations. From those activities, main groups of incomes and expenses arise. Interest income category assumes income from interests earned in bank's lending activities and related revenues, non-interest income includes incomes from fees and commissions and other related revenues, and the last category is other incomes from business activity. On the other side, expenses from bank's business activity include interest expenses that arise from deposits collection activity and related expenses, non-interest expenses that include expenses on fees and commissions and other related expenses, while the category other expenses includes: labour-related administrative expenses (costs of employees), capital-related administrative expenses (amortization, office supplies, etc.) and other expenses from bank's business activity.

The role of insurance companies in the financial market is complex. On the one side, they underwrite and collect premiums for risks undertaken, followed by claim pay-out or pay-off of the sum insured, and on the other side, they invest available reserves and mathematical provision from which they collect a profit. That is why for inputs and outputs variables were selected from the company's annual report, namely its statement of comprehensive income. In the insurance sector, some changes in the number and business performance continuity also happened within the period observed. Consequently, for the purpose of analysis, 17 insurance companies were observed, and that means 112 DMUs. The analysis for the insurance industry in this paper is performed on the available data for the period 2012-2018. For each j-th DMU (i.e. for an insurance company) the input data (x_{ij}) include:

        Input 1, (x_{1j}) → net operating expenses,
        Input 2, (x_{2j}) → investment costs,
        Input 3, (x_{3j}) → claims incurred.

Output data (y_{ij}) include:

        Output 1, (y_{1j}) → earned premiums,
        Output 2, (y_{2j}) → investment income.

5. Empirical research results

Since the super-efficiency DEA model deals with pooled data, the excel output from DEA Solver Pro resulted in the efficiency scores ranked from 1 to n depending on the total number of DMUs included into the analysis. Therefore, further statistical analysis of results is made: results are grouped for each year separately, and average values were calculated. Table 3 and Graph 1 show the summary results of Croatian banking and insurance industry efficiency measurement.

Table 3: Croatian banking and insurance industry DEA efficiency measurement summary results

	2012	2013	2014	2015	2016	2017	2018
Banking industry							
Total no. of DMUs	30	29	27	27	25	24	21
No. of efficient DMUs (≥1)	11	5	5	5	4	5	12
No. of DMUs with efficiency >1	9	5	5	5	4	4	11
No. of inefficient DMUs	19	24	22	22	21	19	9
Average (in)efficiency	0.7761	0.4579	0.4224	0.4483	0.4856	0.5661	0.8646
Average efficiency of efficient DMUs	1.2051	1.0428	1.1085	1.0650	1.1037	1.005	1.1754
Insurance industry

Graph 1: Average DEA efficiency scores for banking and insurance industry in the period 2012-2018
Source: Author's calculation

The efficiency analysis results obtained in this paper suggest that Croatia's accession to the European Union did not by itself strongly impact banking sector efficiency since connected structural changes were made in the previous period in addition to changes and adaptation in regulation. Stronger impact on efficiency in the period observed can be seen in consequences of the crisis on business performance as well as input and output data used in analysis and in M&A and failure activities described in the third part of the paper, in addition to the recession effects and application of more strict post-crisis regulatory rules, especially between 2013 and 2016. Exactly in that period, both DEA efficiency scores, average efficiency, and average efficiency of efficient DMU's, declined stronger and recorded the lowest values as well as (less or more) accounting profitability and efficiency indicators (ROAA, ROAE, CIR, etc.). The best overall efficiency results achieved in 2018 confirm this thesis since 2018 was the year when most of the relevant processes (M&A, balance cleaning, failures, etc.) were successfully finished after years of stronger changes and activities in that part and followed by the somewhat "clearer and cleaner" situation in the Croatian banking industry in the sense of survival of efficient and competitive units.

The efficiency analysis results obtained for the insurance industry clearly show the negative effect of market liberalization on efficiency score from 2014. These scores are a direct consequence of a decrease in gross written premium due to reductions of premiums in the motor third-party liability insurance. The highest efficiency scores, and the biggest number of efficient DMU's, was in 2014 due to the conservative investment policies with a goal of achieving a high level of liquidity and investment certainty. The decline in 2015 and 2016 is evident in both average efficiency scores and average efficiency of efficient DMU's whereas the lowest scores, and the highest number of inefficient insurers were in 2016. Subsequent efficiency scores were clearly influenced by the introduction of the regulatory framework Solvency II. It forced insurance companies to meet the basic objective of capital management and maintain the required level of stability, thus ensuring a reasonable level of security for policyholders and maximizing returns to shareholders and policyholders. Although the market environment was rather challenging with high competition in the observed period, and still not completely recovered from the economic crisis, the insurance companies managed to maintain stability and

achieve necessary Solvency Capital Requirement (SCR).

6. Conclusion

Accession to the EU and especially the period before accession, influenced the Croatian financial sector through various channels and in different ways. The main and most important drivers of changes were requirements in the harmonization of the regulatory framework with EU Directives, which were successfully finished precisely in the first half of the period observed. In addition to this, banking sector and banks' business performance were stronger influenced by consequences of the crisis and its impact on capital requirements and additional regulation adaptation in the direction of more strict risk management rules in order to assure satisfactory loss provision due to the increase and very high level of NPLs in the post crisis period, all until 2016. The consequences of such changes and prolonged economic recession period were continuous work on the improvement of asset quality by the cleaning process accompanied by M&A activities and failures. The lowest accounting profitability and efficiency indicators observed as well as DEA efficiency scores achieved in the period 2013-2016 reflect those activities. Although the liberalization as a consequence of Croatian accession to the EU dramatically influenced the gross written premium, the insurance companies were well prepared, so they managed to recover in a short period to be able to satisfy Solvency II capital requirements. This is not visible only in the efficiency scores but also in combined ratio and SCR, which indicate the efficacy and acceptable level of capitalization of insurers' business. It can be concluded that lag in effects of abovementioned regulatory changes is not present in banking and insurance industry due to the reasonable period for business adjustment, although there is a present stronger correlation between regulatory changes and decrease in the number of banks and insurance companies, since the smaller one have stronger difficulties in business adjustments to new circumstances.

APPENDICES

Appendix 1: List of banks (DMUs) included into analysis of banking sector for the period 2012-2018:

1. Addiko Bank d.d., Zagreb[1] (ADI)
2. Agram banka d.d., Zagreb[2] (AGR)
3. Banco Populare Croatia d.d. Zagreb[3] (BPC)
4. Banka Kovanica d.d., Varaždin (BKOV)
5. Banka splitsko-dalmatinska d.d., Split[4] (BSD)
6. BKS Bank d.d., Rijeka[5] (BKS)
7. Centar banka d.d. Zagreb[6] (CEB)
8. Croatia banka d.d., Zagreb (CRB)
9. Erste&Steiermärkische Bank d.d., Rijeka (ESB)
10. Hrvatska poštanska banka d.d., Zagreb (HPB)
11. Imex banka d.d., Split (IMX)
12. Istarska kreditna banka Umag d.d., Umag (IKB)
13. J&T banka d.d., Varaždin[7] (JIT)
14. Jadranska banka d.d., Šibenik[8] (JAB)
15. Karlovačka banka d.d., Karlovac (KAB)
16. KentBank d.d., Zagreb (KEN)
17. Nava banka d.d. Zagreb [9] (NAV)
18. OTP banka Hrvatska d.d., Split[10] (OTP)
19. Partner banka d.d., Zagreb (PAR)
20. Podravska banka d.d., Koprivnica (POD)
21. Primorska banka d.d., Rijeka[11] (PRIM)
22. Privredna banka Zagreb d.d., Zagreb (PBZ)
23. Raiffeisenbank Austria d.d., Zagreb (RAIF)
24. Samoborska banka d.d., Samobor (SAMB)
25. Sberbank d.d., Zagreb (SBER)
26. Slatinska banka d.d., Slatina (SLAT)
27. Splitska banka d.d., Split[12] (SPL)
28. Štedbanka d.d., Zagreb[13] (ŠTED)
29. Veneto banka d.d., Zagreb[14] (VENT)
30. Zagrebačka banka d.d., Zagreb (ZAB)

Notes:

[1] Hypo Alpe-Adria-Bank d.d., Zagreb, changed its name to Addiko Bank d.d., Zagreb, on 11 July 2016.
[2] Kreditna banka Zagreb d.d., Zagreb, changed its name to Agram banka d.d., Zagreb, on 28 December 2018.
[3] Banco Populare Croatia d.d. Zagreb merged with OTP banka Hrvatska d.d., Split on 1. December 2014.
[4] Bankruptcy proceedings were instituted against Banka splitsko-dalmatinska d.d., Split, on 1 July 2016.
[5] BKS Bank d.d., Rijeka, merged with BKS Bank AG, Klagenfurt, on 1 October 2016. At the same time, BKS Bank AG, Branch Rijeka, became operational. It changed its name to BKS Bank AG, Branch Hrvatska, on 30 June 2017.
[6] Bankruptcy proceedings were instituted against Centar banka d.d. Zagreb, on 30 September 2013.
[7] Vaba d.d. banka Varaždin, Varaždin, changed its name to J&T banka d.d., Varaždin, on 2 January 2017.
[8] Jadranska banka d.d., Šibenik, merged with Hrvatska poštanska banka d.d., Zagreb on 1 April 2019.
[9] Bankruptcy proceedings were instituted against Nava Banka d.d. Zagreb, on 1 December 2014.
[10] On 3 October 2018, the Bank changed its head office from Zadar to Split.
[11] Voluntary winding-up proceedings were initiated in Primorska banka d.d., Rijeka, on 21 June 2018.
[12] Splitska banka d.d., Split, merged with OTP banka Hrvatska d.d., Split on 3 December 2018.
[13] Voluntary winding-up proceedings were initiated in Štedbanka d.d., Zagreb, on 27 December 2017.
[14] Veneto banka d.d., Zagreb, merged with Privredna banka Zagreb d.d., Zagreb, on 12 October 2018.

TOURIST EVALUATION OF THE EVENTS OF TOWN OF KARLOVAC ACCORDING TO VISITORS' EXPERIENCES

ABSTRACT

In the scientific and professional literature, certain elements have been defined by which the "value" of events can be estimated. Event managers should not be satisfied solely with supply-related information (physical factors), they should also take into account demand-side data (subjective factors) that imply the experience of the event visitor. The effectiveness of the tourist valorisation of events depends on the prior research of visitors' perceptions and their preferences in the selection of each event and related contents. The subject of this paper is the tourist valorisation of four events of the town of Karlovac (Spring Promenades, The Bonfire of Karlovac, Balloon Festival, Beer Festival, Advent) that were held during 2019 according to the subjective factors of valorisation. The aim of the paper is to evaluate the value and growth potential of four events of the town of Karlovac in 2019 according to subjective factors of valorisation (visitor experience). A descriptive research of the attitudes of visitors of five events of the town of Karlovac was conducted on an intentional sample of 1167 visitors in the period from 28th of April to 23rd of December 2019. An interview method was used to examine visitors' attitudes. Descriptive statistics was used to describe the level of visitor satisfaction with certain contents of events. The results of this research seek to expose the subjective aspect of the value of the events for visitors. The authors also want to evaluate the growth potential of the above mentioned events based on the findings of visitor satisfaction. The results of this research benefit those entities that manage the organization of various events for the purpose of improving the quality of services, as well as for the full gradation of events according to objective (physical resources) and subjective factors (visitor satisfaction) at the same time. The entities that manage the organization of events combine objective factors with the subjective experiences of visitors. They conduct research of visitors' attitudes in order to determine the proper life cycle stage and sustainability of the event. They also can create a valorisation model for each type of event that will more precisely define the evaluation factors and criteria with respect to the specifics of each event.

Keywords: event, visitors, subjective factors, objective factors, visitor satisfaction.

1. Introduction

Destinations around the world develop various events in order to build a brand of the destination, extend the tourist season, encourage investment, generate revenue and boost the local economy. Nowadays, tourists seek to gain experience that will give them a higher level of satisfaction. Experience can be gained in a variety of ways such as involvement in community life, learning about the traditions and habits of the local population etc. One of the most common way of gaining experience are events organized on the topic related to the various aspects of local life (local gastronomy, manufactures, traditional manifestations etc.).

Numerous Croatian destinations develop events in order to attract tourists. Karlovac is a relatively small town in the center of Croatia that has, due to the natural and anthropogenic resources as well as its traffic position, a great potential for development of tourism. Karlovac Tourist Board, Town of Karlovac and various associations are constantly working to develop events that will empower tourism as well as attract local visitors and increase the expenditure. There are a few events that are held regularly in Karlovac. Authors of this paper made a research on the subject of visitors experience at five events that were held in Karlovac during 2019 (Spring Promenades, The Bonfire of Karlovac, Balloon Festival, Beer Festival, Advent). Previous research on the topic of events held in town of Karlovac was based on motivations for attending those events (Vitner Marković, Varičak, Cegur Radović, 2019).

The aim of this paper is to evaluate the value and growth potential of five events of the town of Karlovac in 2019 according to subjective factors of valorisation (visitor experience). The following research questions were formed:
1. Are the visitors of the event planning on revisiting (coming back)?
2. How many times have they visited the event so far?
3. Will the visitors recommend the event to other people?
4. Are the visitors satisfied with the programme of a specific event?
5. What is the overall satisfaction of visitors with a specific event?
6. What is missing in that specific event?
7. In which direction should that specific event head in the future?
8. Do they recognize the potential for growth for that specific event?

According to the subject and the aim of this paper the main hypotheses of this paper are:
MH1 - Visitors of the events of the town of Karlovac during 2019 (Spring Promenades, The Bonfire of Karlovac, Balloon Festival, Beer Festival, Advent) are pleased with the contents of the events,
MH2 - The events of the town of Karlovac, that visitors are pleased with in the development perspectives, show the potential for growth.

A descriptive research of the attitudes of visitors of five events of the town of Karlovac was conducted on an intentional sample of 1167 visitors in the period from 28th of April to 23rd of December 2019. An interview method was used to examine visitors' attitudes. Descriptive statistics was used to describe the level of visitor satisfaction with certain contents of events. The research instrument for the purposes of this paper also contains open-ended questions related to the observations and suggestions of visitors in order to improve the quality of events, as well as possible shortcomings. The answers to the same questions determine the growth potential of a particular event and indicate the corresponding phase of the life cycle from the marketing aspect.

2. Methodology

A descriptive survey was conducted during the year 2019 measuring attitudes of visitors' at events in the city of Karlovac: Spring Promenades, The Bonfire of Karlovac, Balloon festival, Beer festival, Advent. Spring Promenades were held during weekends from 27th of April to 18th of May. 324 visitors were questioned. On June 23rd a survey was held with 150 visitors of the Bonfire of Karlovac. From 28th to 30th June, during the same year, a survey was held on 150 visitors of the Balloon festival. From 30th of August to the 3rd of September 283 visitors of the Beer festival were surveyed. In the period from December 18th to December 23rd during the Advent event survey was held on 260 visitors. The aim of the research was to examine visitor attitude about satisfaction of certain elements of held events, the intention to visit again, the feeling of loyalty, the shortcomings of this event and the direction of future development of the observed events in the city of Karlovac. Open-ended questions in the questionnaire were intended for highlighting potential and possibilities for future development. A combination of questionnaire and interview method was used during the research. The research was conducted using a convenience sample, which is a form of non-probability sampling. The visitors questioned were mostly from Karlovac. The questionnaire had close-ended and open-ended questions. The questionnaire measured the respondents' event satisfaction, respondents' event loyalty and demographic data (adapted from Marković, S. et al., 2018). The visitors had to answer 33 questions of structured questionnaire. The research was anonymous. Data collection was followed by data analysis and processing. Visitors attitudes were measured by a Likert scale for scaling responses in the range from 1 to 5 (1- completely unsatisfied, 5 – completely satisfied).

Variables contained in the instrument of the research were described with the descriptive statistics. Used measures for central tendency were arithmetic mean (complete measure), and mode (positional measure). For the purposes of this research the elements of the tourist valorisation of the event were graded by subjective factors (satisfaction, loyalty).

The elements of the tourist valorisation of events are based on the attitudes of visitors of those events for potential growth (the life cycle of the events) and the quality of the programme from the perspective of the level of visitor satisfaction.

3. Theoretical background

Desire and behaviour of nowadays tourists are changing and they are becoming more interested in specific products and services. Due to that various specific forms of tourism are developing. Specific forms of tourism are characterised by emphasized individuality in satisfying tourists' needs and desires (Težak et al., 2011). One of these specific forms of tourism is event tourism. The roles and impacts of planned events in tourism have been well documented and are of an increasing importance for destination competitiveness (Getz, 2008, cit. in: Težak et al. 2011).

3.1 The tourist valorisation of events

Event sector is fast growing sector which is connected to various other sectors. They remain the single most effective means of providing a high touch experience. According to Goldblatt there are four factors affecting event growth: demographic, technological, disposable income shifts, time shifts (Goldblatt, 2000). McDonnell, Allen, and O'Toole describe the typical impacts resulting from events in Australia in their book 'Festival and Special Event Management' (1999). According to them possible event impacts include: increased visitation

during the shoulder or off season; enhancing the overall tourism experience; being a catalyst for development; promoting economic benefits; and finally as a means of promoting the long term impacts within destinations (McDonnell, Allen, and O'Toole, 1999).

Events are mostly recognized as a part of a tourism industry and often tourists are important stakeholders when planning the event. But due to Getz not all events need to be tourism oriented and some fear the potential negative impacts associated with adopting marketing orientation. As well, events have other important roles to play, from community-building to urban renewal, cultural development to fostering national identities tourism is not the only partner or proponent. (Getz, 2008) The elements with which the tourist valorisation of events is carried out are defined according to the scientific literature. Getz, (2008, 407) recognizes the next elements:

- potential for event growth (phase of the event life cycle),
- stake in the market of happenings on the destination (in relation to the other event of the destination),
- the quality of the content/programme,
- the influence on the image of the destination (as well as recognition in the identity of the destination),
- the influence on the local community (domicile population and quality of life),
- environmental impact,
- the economic benefits of the event (stimulating consumption, business opportunities),
- sustainability of the event (economical, social and ecological),
- suitability of the event (in reference to the suitability of the content of the event to the targeted group – ie. interpretational content).

Model of the tourist valorisation of space according to UNWTO-u (2011, 96) also takes the objective factors like physical resources, that is the space in which the event is being held. Valorisation of the space in which the event is being held means accessibility of the locality (traffic connection, signalization, the distance between the locality relating to the main tourist zones of the destination), degree of utilization of the site (carrying capacity of the site), specificity of the space, availability of the tourist services in the locality (visitor content), inherent characteristics of the locality (architectural, historical and artistic value of the locality). The objective factors are commonly combined with the subjective experience of the visitors. That is what makes grading the events according to objective (physical resources) and subjective factors (the experience of the visitors) simultaneously possible.

Events and festivals offer a range of benefits at different stages of their development to tourism destinations. In return, destinations provide events and festivals with a venue, an audience, a workforce, joint marketing opportunities and a host community. So, it is important to determine phase of the event life cycle.

3.2 Tourism Area Life Cycle (TALC)

TALC model is one of the most widely cited and applied theories within the tourism literature and has been used as a model linking the development cycle of tourism destinations to that of products in the product life cycle model (Holmes, Ali Knight, 2017). Due to the Getz and Frisby festival tourism was termed "an emerging giant" (Getz and Frisby, 1988; Getz, 2010). Festivals and events are closely related to the destination where they are held. They can extend the tourist season, encourage investment, generate revenue and boost the local economy (Derrett, 2003). Events and festivals can be seen as building blocks of destination image and attracting tourists

(Getz, 1991). Events and festivals offer a range of benefits at different stages of their development to tourism destinations. In return, destinations provide events and festivals with a venue, an audience, a workforce, joint marketing opportunities and a host community. These mutual benefits imply interlinked development cycles. (Holmes, Ali-Knight, 2017). Butler describes six stages of life cycle: exploration, involvement, development, consolidation, stagnation and then either rejuvenation or decline (Butler, 2006). There are a number of published studies of events, which apply the TALC to events and festivals (Holmes, Ali-Knight, 2017; Frisbyand, Getz, 1989; Getz, 2002; Davies, 2011).

According to the Butler model of the life cycle of the product and services in tourism (exploration, involvement, development, consolidation, stagnation, rejuvenation/decline) a research was conducted (Racasan, 2015, 206) which includes tourist valorisation of the event according to objective factors and the life cycle of the specific event. Tanford, Jung (2017) researched the connection between the level of satisfaction and loyalty of the event visitors. They analyzed the scientific literature that relates to the event tourism for the purpose of determination and assessment of attributes that contribute to satisfaction and loyalty of the event visitors. A strong bond between the level of satisfaction and loyalty of the event visitors was established. They pointed out several key physical attributes that determine them.

Kim's research begs the following question: If tourism impact is indeed perceived by community residents and these perceptions do influence their sense of well-being in various life domains and overall life, then could this influence vary depending on where the community is in the tourism development life cycle (introduction, growth, early maturity, late maturity, and decline)? Again, answers to these questions are very important to both community leaders and tourism officials. This is due to the fact that tourism policies and programs formulated to enhance residents sense of well-being in material, community, emotional, and health/safety life may work more effectively in certain stages of the tourism development life cycle than others. Such information is vital to tourism development policy (Kim, 2013).

Dodds (2019) argues that there is a need to understand the life cycle for a tourist, in addition to one for a destination. The seasoned traveler that is more familiar with a destination may treat it with more respect – something that all destinations crave yet the focus of destinations is often on attracting the new visitor rather than the repeat. There is no debate that understanding the motivations, type of experience and locale where the experience is consumed will shift, it is proposed by this Tourism Experience Life Cycle that the seasonality of the tourist may have been overlooked. Depending on their amount or experience of travelling may also go through the same lifecycle type approach: namely excitement, novelty, normalization and familiarity. The final stage, familiarity, is when the visitor may not even need a map or may in fact provide directions to other tourists. Therefore, this figure posits that the more familiar a tourist is, the less touristy they will act and the more they will seek out 'other' types of experiences or act less like a traditional tourist and more like a local. They also may feel more responsibility toward the destination as they are more familiar and therefore treat it more like their home.

3.3. Visitor satisfaction

Overall quality and customer satisfaction have been used as global evaluations (Oh et al., 2007, 123). Satisfaction is measured as overall satisfaction with the festival, as satisfaction with specific attributes is classified in the relevant attribute category (Tanford, Jung, 2017, 213). Studies demonstrate that the organization of cultural events could be a measure of product quality and a determinant of tourism satisfaction (Chhabra et al., 2003; Kruger et al., 2013). The

individual beliefs influence the level of satisfactions (Brida et al., 2013). In the literature it is referred with terms festival (Yoon et al., 2010; Tanford and Jung, 2017) and visitor (Yan et al., 2012). Many researches did an empirical investigations of the relationships between service quality, satisfaction and behavioral intentions among visitors (Tian-Cole et al., 2002; Petrick, 2004; Lee, and Beeler, 2007; Cole, Illum, 2006; Baker, Crompton, 2000).

Event managers aim to continuously improve the quality of events by simultaneously increasing the level of visitor satisfaction and cost rationalization (Bowdin, GAJ, Church, IJ, 2000). Subjective factors play a significant role in improving quality and implementing valorisation, among others (visitor attitudes). Quality improvement is recognized in the development of new manifestations or the improvement of elements of already existing ones (Bowdin, G. A. J., Church, I. J., 2000).

Based on the study (Cole, Chancellor, 2009; Marković, et al., 2018) authors of this article examine the level of visitor satisfaction of Karlovac festival's attributes (programs, amenities, entertainment quality, social interaction) and their intentions to return. As tourism literature states that a deep understanding of the differences between first time and repeat visitors is relevant in developing effective tourism marketing strategies (Lau, McKercher, 2004), can be used as a basis to understand the development of loyalty and to identify a destination's position in its life cycle (Oppermann, 1998).

4. Research results

The answers to the research questions in this paper are directed towards the marketing aspect of event management (level of satisfaction of event visitors with contents and programs, loyalty of visitors, intention to visit again, recommendation of visiting friends and acquaintances by word of mouth marketing, etc.). The observed variables (satisfaction, loyalty) contained in the instrument of research were described with descriptive statistics. Measures of central tendency used are arithmetic mean and mode. Based on the answers of open-ended question „In which direction should that specific event head in the future", „Do you recognize the potential for growth for that specific event", "Have you visit the event before", as well as the level of their satisfaction, helped to determine the life cycle of each event.

The sample consisted of 1167 respondents classified into three target groups (domestic visitors, trippers, tourists). Surveyed visitors were mostly domestic. There were more females then males, approximately mature ages. Table 1 shows general, demographic characteristics of respondents who visited events held in the town of Karlovac. It can be seen that female respondents were in the majority at most of the events (except Beer festival). On the average 57,58% of the respondents were female. At Beer festival over 54% of respondents were male. More than 30% of the respondents for majority of events were age 18-25 (on the average 31,54%), second in representation are respondents aged 36-45 and the smallest number of respondents were older people (aged 66 and more).

Table 1: General characteristics of the Karlovac event visitors in year 2019

Spring Promenades		The Bonfire of Karlovac		Balloon Festival		Beer Festival		Advent	
Age	Percentage	Age	Percentage	Age	Percentage	Age	Percentage	Age	Percentage

Significant 97% of surveyed visitors of Spring Promenades answered that they would visit it again next year. Also, most of the surveyed visitors have attended the Spring Promenades in previous years (78%). Visitors are satisfied with the event (4,23). Visitors believe that the development of the event shows promise and they also believe it needs more themed content.

More than 85% of visitors answered that they would visit the Bonfire of Karlovac again and recommend it to others. Most of the surveyed visitors have attended the Bonfire of Karlovac in previous years (65%). Visitors are satisfied with the event (4,18) and they believe it's developing in the right direction.

The Balloon Festival was first carried out in the year 2019. More than 90% of surveyed visitors answered they would visit the festival again and recommend it to others. Visitors are satisfied with the event (4,20).

Visitors are satisfied (3,68) with the overall realization of the Beer Festival. The event went through significant location changes regarding it's availability and inherent site characteristics. Most of surveyed visitors already visited the event once (83%) and will recommend it to others. Likewise, visitors are satisfied (4,15) with the overall realization of Advent event, they visited the event before (52%) and are likely to recommend it to others.

Below is a summary of the most common responses of event visitors to open questions in the research instrument:

- Spring Promenades - visitors want something new, conceptually and substantively different, inventive, refreshing;
- The Bonfire of Karlovac - visitors believe that the event is developing in a promising direction and that there is room for improvement of existing content;
- Ballon Festival - although visitors are visiting an event of this nature for the first time, they believe that it should be developed by improving the existing content on the existing concept;
- Beer Festival - visitors believe that the event has undergone a significant transformation in terms of accessibility and use of the site, the inherent characteristics of the site, the content of the program, etc.;
- Advent - visitors believe that the event is developing in a promising direction and that there is room for improvement of existing content.

This summary plays a significant role in determining the growth potential of each event. Table 2 shows evaluation of the events by visitors. Evaluation was based on subjective factors e.g. visitor attitudes.

Table 2: Evaluation of events in Karlovac during 2019 based on subjective factors (visitor attitudes)

Number	Event (during 2019)	Arithmetic Mean (overall visitor satisfaction)	Mode	Repeat Visit of Surveyed Visitors	Life Cycle (based on subjective factor)
1	**Spring Promenades**	4,23	5	78%	Consolidation
2	**The Bonfire of Karlovac**	4,18	4	65%	Development
3	**Balloon Festival**	4,20	4	0%	Involvement
4	**Beer Festival**	3,68	4	83%	Rejuvenation
5	**Advent**	4,15	5	52%	Development

Source: Authors' on the basis of research results, N=1167

Since the initial hypotheses of conducted research were MH1 - Visitors of the events of the town of Karlovac during 2019 (Spring Promenades, The Bonfire of Karlovac, Balloon Festival, Beer Festival, Advent) are pleased with the contents of the events, MH2 - The events of the town of Karlovac, that visitors are pleased with in the development perspectives, show the potential for growth and according to the results shown by the Table 2 and the summary of open questions responses it can be concluded that aforementioned hypotheses have been confirmed.

5. Conclusion

Event industry became one of the fast growing industries. Many destinations develop different events to build a brand, to connect to domestic and foreign visitors, to extend the season, increase revenue etc. Quality event management becomes a necessity especially in augmenting the quality of a destination to make it distinctive by the experiences it offers and the extent to which it is capable of meeting the needs of modern guests/visitors. Hence, it is important to continuously measure visitor satisfaction with events to ensure that an event offering is designed in accordance with the expectations of modern guests/visitors.

Subjective factors of tourist valorisations of events, ie attitudes of visitors in this research, determine certain life cycle of events. Conducted research of the attitudes of visitors at events held in Karlovac during 2019, was focused on the components of the marketing aspect of event management (level of satisfaction of visitors with content and programs, visitor loyalty, intention to visit again, recommendations for friends and acquaintances by word of mouth, etc.). Also important are the attitudes of visitors regarding the recommendations for improvement and the perspective of the development of events in the future. Visitors' attitudes about the development perspective and the necessary improvement of individual events played a key role in defining the development phase and the consolidation phase, given that visitors are generally satisfied with the events in both cases.

Descriptive analysis of observed variables "visitor satisfaction", "visitor loyalty" determined the phase of life cycle of the events in the town of Karlovac. This research is based on subjective factors of tourism valorisation of the events on visitor satisfaction. Average rating and answers given by visitors in open-ended questions were crucial to determining the life cycle of events in question. Events that visitors were satisfied with show a growth potential. Recommendations

for future research relate to a more comprehensive analysis of objective and subjective factors of tourist valorisation of the events simultaneously in order to find the optimal evaluation model. Also, future research should investigate the level of satisfaction separately for those who visited the event for the first time from those who have visited it several times before, with the purpose of defining also the life cycle of the visitor experience.

IMPORTANCE OF GASTRONOMY HERITAGE FOR TOURISM DEVELOPMENT – THE CASE OF MEDITERRANEAN DIET IN CROATIA

ABSTRACT

Continuous increase of interest for gastronomy on demand side of tourism market has a positive influence on the increase of gastronomy importance in the tourism product of Croatia, especially in sustainable development of special interest tourism. Due to increasing competition on tourism market and emergence of new tourism destinations with different tourism products, gastronomy heritage as a part of cultural heritage of a nation and area becomes one of the most important resources in achieving competitive advantage. Croatia possesses an exceptional treasury of gastronomy heritage and a great potential for its tourism valorisation. Original and indigenous cuisine of Mediterranean area attracts attention of both scientists and tourists. Mediterranean diet, in Croatian and other Mediterranean areas, manifests itself in social, spiritual and tangible aspects of life and represents the foundation for identity of those areas. Today, Mediterranean diet is considered as a preferred standard of proper nutrition, as it is inscribed onto the UNESCO List on Intangible Cultural Heritage. Along with increasing importance of gastronomy as a motive for the arrival of tourists to Croatia, this area of research becomes more interesting. The aim of this paper is to analyse key characteristics of Croatian gastronomy heritage and especially Mediterranean diet and its importance and possibilities of valorisation in tourism of Croatia. To reach the aim, two-step primary research was taken. This included focus group with students and in-depth interview with the conceptual initiators of the projects rated as best practice examples. The results showed that Croatian gastronomy offer, especially based on original Mediterranean diet, can provide additional incentive to increase quality and unique experience in tourism.

Key words: gastronomy heritage, Mediterranean diet, identity, Croatia.

1. Introduction

Despite the globalization trend which has resulted in a number of unified and standardized elements of the tourism offer, tourists are quite focused on products based on local culture and tradition which provide unique tourism experience. Intangible elements and values within tourism products and services became very important in creation of competitive advantage among destinations. Gastronomic heritage incorporated in gastronomic tourism offer represents an opportunity for providing unique experience (Lin, 2014; Fandos Herrera et al., 2019). Due to this fact, destinations which are using their gastronomic can assure competitiveness of

tourism. Cultural aspect of gastronomy is based both on tangible elements (e.g. ingredients for preparation of meals and representative product packages), but also on intangible elements and values (e.g. techniques and methods of growing food and the skills of preparing traditional dishes). They jointly contribute to the greater value and recognition of the area, that is, the destination in terms of tourism (Ron and Timothy, 2013; Pérez Gálvez et al., 2017; Hernández-Mogollón et al., 2019). Gastronomy embodies all the traditional values associated with the new trends in tourism: respect for culture and tradition, a healthy lifestyle, authenticity, sustainability and experience. (Gaztelumendi, 2019).

Croatia has a rich and diverse intangible heritage, and gastronomy is of particular importance. Numerous associations for the preservation of tradition, especially at the local level, make a significant contribution to the preservation tradition by transferring knowledge and skills to new generations and by studying and documenting this valuable part of heritage. Within the intangible heritage, gastronomy is positively emphasized in its involvement in tourism offer. Croatian gastronomic culture is undoubtedly one of the most interesting and richest in Europe, primarily because it combines the Central European, Mediterranean and Oriental cuisine, but also because it is based on extremely healthy foods (Žutelija, 2019, 10). In an interesting and relatively small geographical area there is a wide range of different cuisines, customs and gastronomic heritage which is a result of the turbulent and long history of the area. Each Croatian region has its own gastronomic specifics and special culinary personality. From proto-Slavic essences mixed with Hungarian, Viennese and Turkish influences in meats, desserts and vegetable dishes of continental regions, to Greek, Roman and Illyrian Mediterranean flavours of fish delicacies and wines of the coastal region. The variety of Croatian cuisine is reflected in numerous specialties, from aperitifs such as the world-famous Maraschino from Zadar, appetizers such as cheese from the island of Pag, Slavonian ham and kulen sack, Ston oysters and mussels, excellent grilled fish, salty anchovies and delicacies such as eels and frogs from the Neretva valley, turkeys with pancakes, Dalmatian paticadas, and desserts such as cotyledons, croutons or fritters (Croatian National Tourist Board).

Gastronomic heritage is of great importance in unique tourist experience creation and exploration of tourism destination. The growing role of gastronomy as a motive for the travel to a certain destination provides a great potential for quality and sustainable long-term growth and development of tourism products in Croatia. The important thing that has to be taken into consideration are trends in gastro tourism, which include molecular food, slow food, macrobiotic food, eco, functional and vegetarian food (Skryl, Gregorić and Dugi, 2018). These trends can be implemented in gastronomic tourism offer in Croatia based on local cuisine. As an example of underutilized intangible cultural heritage, the paper particularly emphasizes Mediterranean cuisine, which is still not properly valorised in Croatia and has an exceptional potential for valorisation in tourism. According to Skryl, Gregorić and Dugi (2018), Croatia needs to strengthen the development of indigenous Croatian cuisine, which will cover all the specific dishes of all regions in Croatia by emphasising traditional Croatian dishes and following new trends. As a valuable resource of the intangible cultural heritage, Mediterranean cuisine has been recognized by UNESCO as being on the list of protected intangible heritage. In Croatia, there is 14 other intangible cultural heritage elements on the Representative list of the intangible cultural heritage of humanity. This makes Croatia the second country in Europe and fifth in the world in terms of these valuable intangible cultural assets. (UNESCO, 2020). The main aim of the paper is to explain the role of gastronomy in tourism, as well to explore the potential of food tourism offer in Croatia.

2. Theoretical background

Eating is one of the fundamental human activities and tourists spend nearly half of their budget on food and beverage while traveling. On the other hand, tourists became increasingly demanding and focused on specific interests, derived from very specific and personal motivation (Pulido-Fernández, Casado-Montilla and Carrillo-Hidalgo, 2019). Therefore, food is accepted as an essential tourism product and recognized as an important attraction (Okumus, Koseoglu and Ma, 2018: 74). As Ellis et al. (2018) stated, "the subject of food tourism, or the close relationship between food and tourism, has been a visible tourism research area for the past three decades, but its unprecedented growth and popularization in the tourism literature has witnessed in the more recent years (2008–2015)". Due to same authors, in recent years there as significant increase in special issues of journals devoted too food tourism, as well as specialized conferences on topics related with food and tourism. To see the opportunities of using food in tourism, it is important to understand the importance and the role of food for tourists, which is two folded. Firstly, food can be a main motive for traveling. In this case, it is a special interest tourism called enogastonomic tourism, which can be defined as "tourists visiting primary and secondary food producers, food festivals, restaurants and specific locations for which food and tasting and/or experiencing the attributes of a specialist food production region are the primary motivating factors for travel" (Hall and Mitchell, 2001: 308). Tourist primarily motivated with food and wine (or some other type of drink, e.g. coffee, tea, gin…) are quite acquainted with food tourism offer and search for something authentic and different, something worth of traveling. Second type of tourists includes all tourists whose primary travel motive is not food, but food becomes a part of their travel experience. As Tsai and Wang (2017: 57) stated, interest of tourists for authentic gastronomic offer as well the consumption, provides a deeper understanding of the lifestyle of local residents, since "food choice and consumption practices have been passed on from generations to generations and have been an essential element forming a particular culture" (Weng Si and Couto, 2020). In addition, food tourism has the capacity to impact upon a number of other areas. It can help simulate the resurgence of regional gastronomies, which in turn creates food heritage and distinctive foodways (Kim, Park and Lamb, 2019: 176). Before concrete examples of food involvement in tourism offer, it is necessary to explain the connection between gastronomy, culture and tourism.

3. Key determinants of gastronomy in tourism

The Encyclopedia Britannica (2020) defines gastronomy as the art of selecting, preparing, serving, and enjoying fine food. The development of culinary habits depends on the social, geographical and historical context. Therefore, culinary cultures differ depending on attitudes and tastes that people associate with cooking and eating (Žaper, 2004, 229). The wealth of the local heritage treasury is important pull factor for attracting tourists and creating a unique gastro experience. Gastronomy has a particularly important role to play in this, not only because food is central to the tourist experience, but also because gastronomy has become a significant source of identity formation in postmodern societies. More and more, 'we are what we eat', is not just in the physical sense, but also because we identify with certain types of cuisine that we encounter on holiday (Richards, 2003, 3).

3.1. Gastronomy as a part of heritage and a part of destination image

The cuisine and food characteristic are closely related to the culture and customs of the certain area. Due to the fact that the originality and the tradition became an indispensable trend, their implementation in tourism offer contributes to the preservation and recognition of that same

heritage. Increasing interest in gastronomy, the culture of eating and the eating habits led to the stronger promotion of food as an important part of identity. The 'comfort foods' of childhood become the refuge of the adult cocooner. Any attempt to change our eating habits is seen as an attack on our national, regional or personal identity (Richards, 2003, 4). Inclusion of flavours and aromas of traditional dishes in tourism offer assures better experience which will stay in memory for longer period of time. But when it comes to nutrition as an intangible cultural asset, it also implies a broader framework, not just a recipe for typical dishes of a particular region. In the valorisation of gastronomic heritage, destinations face the challenge of building the identities of particular areas to make them recognizable culinary destinations. Therefore, the involvement and cooperation of all stakeholders in the destination is of great importance. It is also important continuously improve the quality of gastronomy based tourism products at all levels (from local food manufacturers, caterers, the public sector, as well as other diners directly or indirectly involved in the provision of tourist services in the destination). Croatia has an exceptional gastronomic heritage that varies by geographical area, by type of cuisine and origin of dishes. There is a variety of top Croatian wines, home-made spirits, olive oils, dried meat specialties, cheeses, etc., which makes the gastronomic offer very interesting and attractive for many tourists coming to Croatia motivated by gastronomy. Croatia gained special value and recognition due to the fact that UNESCO has protected Mediterranean diet, which is a part of tourism offer in numerous destinations.

According to UNWTO, gastronomy is one of the strategically important elements in the process of defining the brand and the image of a destination. Research results show that 88.2% of respondents consider that gastronomy is a strategic element in defining the brand and image of their destination. Only 11.8% were of the opinion that gastronomy played a minor role. However, a smaller percentage of respondents believe their country has its own gastronomic brand: only 67.6% responded in the affirmative. In fact, a significant percentage (32.3%) believe that their country has not structured its own brand of gastronomy, meaning that, in general, destinations still have some ways to go in terms of their strategic reflection on gastronomic tourism (UNWTO, 2012, 12).

3.2. The importance of gastronomy for tourism in Croatia

The developed gastronomic offer in the tourist destination significantly contributes to the quality of the overall offer and encourages tourist consumption. It has many positive effects, such as contribution to the development of certain special interest tourism beyond the period of the main tourist season, encouraging the revitalization of rural areas, because these are often areas of authentic ambience and experience, etc. Local organic farming is also concentrated in these areas, so tourism development enables local producers to market their farmed products.

In the last 15 years, Croatia has improved the quality of selected agricultural products to a large extent, which has provided preconditions to become a recognizable gastronomic destination. At the international level, the awareness of tourists about the rich gastronomic heritage of all Croatian regions is also increasing, which is confirmed in the results of TOMAS research on the motivation and habits of tourists in Croatia done by Institute for tourism. According to this, research, there is an increase in the importance of gastronomy as a motive for coming to Croatia, which is shown in the Graph 1.

Graph 1: Motives of tourist arrivals in Croatia and average spending per tourist, 2007-2017
Source: Institute for Tourism, TOMAS Summer Survey - Attitudes and Expenditures of Tourists in Croatia, 2007 - 2017

In 2007, gastronomy was the fifth motive for coming to Croatia. In 2017, it was on the third place. Total tourist spending per person per day in the same period increased from € 55.48 in 2007 to € 78.77 in 2017. (IZTZG, TOMAS 2007 2011) According to the same source, there was a slight increase in tourists' consumption of food and drink outside the accommodation.

It is extremely important that the local stakeholders in the destination understand the importance of gastronomy, not only to stimulate tourist consumption but also to create unique tourist experiences that will ensure long-term competitiveness in the tourism market. In today's highly dynamic environment, it is necessary to provide a unique tourism experience based on heritage and tradition. In the last ten years tourism stakeholders in Croatia have recognized the potential of gastronomic heritage in positioning a destination and creating a recognizable identity in the global tourism market, which has resulted with an increasing number of exceptionally high quality and recognized small local producers of agricultural products, top restaurants, winners of prestigious Michelin stars as well as an increasing number of top eno-gastronomic events.

In 2020 seven Croatian restaurants is Michelin starred (restaurants Boskinac, Novalja and LD Terrace, Korcula awarded one prestigious star, while Noel in Zagreb, Draga di Lovrana in Lovran, Pelegrini in Šibenik, restaurant 360º in Dubrovnik and Monte in Rovinj have successfully retained their previous star awards. The Bib Gourmand list has ten restaurants in

2020, while the MICHELIN Plate label has a total of 53 restaurants (Michelin, 2020). Guide Gault & Millau presents the Croatian gastronomic scene worldwide, which makes Croatia recognizable food & wine destination. Gault & Millau Croatia 2020 The gastronomic guide in 2020 presented 202 restaurants, 82 POP restaurants, 101 wines and 20 hotels (Gault & Millau Croatia, 2020). This growth of international awards for local restaurants and chefs leads to better visibility of Croatia on a world gastronomy map. An important factor is also globally recognized Mediterranean cuisine, which is local, original and authentic in the Croatian coastal areas.

4. Mediterranean diet – underused resource for tourism development in Croatia

The Mediterranean lifestyle, as well as Mediterranean diet, is in the focus of numerous researches for many years. Some medical studies have shown that Mediterranean diet has many long-lasting health effects. The Mediterranean diet originates in the food cultures of ancient civilizations developed around the Mediterranean Basin and is based on the regular consumption of olive oil (as the main source of added fat), plant foods (cereals, fruits, vegetables, legumes, tree nuts) , and seeds), the moderate consumption of fish, seafood, and dairy, and low-to-moderate alcohol (mostly red wine) intake, balanced by the comparatively limited use of red meat and other meat products (Lacatus et al., 2019). In 2013 Mediterranean diet is being listed on the UNESCO's Representative List of World Intangible Cultural Heritage. It is a multinational enrolment encompassing communities and territories from seven Mediterranean countries (Italy, Spain, Morocco, Greece, Portugal, Cyprus and Croatia), representing skills, knowledge, practices, beliefs and traditions related to agriculture and fisheries, processing, preparing and especially consuming food. The Mediterranean diet is the part of the identity of the people living in the area, conditioned by different influences and cultures. The term Mediterranean Diet Derivatives from the Greek Diet: the Way of Life, the Connection between Spirit, the Body and the Environment1. It is not only a nutritional model, but a phenomenon of encompassing food production, marketing, consumption, conviviality, ritual and symbology of the Mediterranean, as well as Mediterranean cuisines and foods (Gonzales Turmo, 2012, 116).

One of the conditions for joining Croatia's initiative and joint candidacy was the inclusion of the Mediterranean diet on the national protection list. As in other countries in the Mediterranean region, in Croatia, the Mediterranean diet is integrated in the social, spiritual and material spheres of daily life (Ministry of Culture, 2013), which is evident in the customs and rituals, as well as in the language of the local people.

The Mediterranean diet is a part of Mediterranean lifestyle, and should be observed in broader context through the characteristic elements (Ministry of Culture of the Republic of Croatia):

- Coexistence with nature - the Mediterranean landscape assures the long-lasting connection between nature and human, which includes adaptation to climate and scarce resources such as water and arable land. The Mediterranean diet precisely inherits the knowledge and skills of attentive attitudes towards the natural sources that constitute the food source.
- Typical products and supplies - daily consumption is based on consumption local and seasonal supplies which include: olive oil, wine, fresh vegetables and beans, fresh or salted fish, cheeses mainly of goat or sheep's milk, dried meat and fresh or dried fruits. By favouring local production, the Mediterranean diet contributes to the preservation of old, indigenous varieties, traditional methods of food production and processing.

- Food preparation and knowledge transfer - The Mediterranean diet is part of unique lifestyle where food is extremely valued and never thrown away. The "common table" is an opportunity for the exchange and transfer of knowledge, as well as strengthening of community.
- Sociality - The Mediterranean lifestyle is reflected in numerous social activities related with food (e.g. joint meals, joint agricultural work, socializing in the tavern afterwards, etc.)
- Well-being - Mediterranean nutrition is a sustainable, social and cultural model of living in harmony with the environment. It involves physical indoor and outdoor activities, as well as a balanced diet, which are crucial factors for a quality life.

An important characteristic of the Mediterranean diet is very close connection with nature as a source of food. Agriculture and fisheries represent an important starting point for the overall development of the area. The Mediterranean diet model is the basis of the entire culinary system of the coast, islands and hinterland. The relationship between natural resources and human needs, and consequently human skills, reflects on the diet of the local people: it is a matter of living in harmony with the natural benefits. Beside the connection between nature and nutrition, there is also a social component, which was very important in the past, but is not negligible even today. Therefore, the diverse knowledge and skills associated with nutrition in the Croatian Adriatic need to be preserved and transferred on new generations so as not to be lost under the influence of the modern lifestyle. Food is an essential part of numerous festivities and events. It is an important component of tourism offer which can provide long-term positive effects for the destination.

5. Positive examples of eno-gastronomic offer in tourism in Croatia

Due to Perkov (2003) "the gastronomic offer of authentic, indigenous dishes should be used as tourism marketing brand, which means that by internationalizing local Mediterranean flavours, we can present our cultural roots more systematically to the world". The potential of Croatian gastronomy for tourism has been in the focus of researchers in last few years, due to the fact that food has become one of the important motives for travel. The research made by Leko Šimić and Pap (2016) was conducted with the aim of identifying key issues of positioning food as an important component and possibly a competitive advantage of Croatian tourism. Authors distributed questioners both on the supply and demand side, which enabled them to make a comparison of the supply-side perception of tourists' satisfaction and actual tourists' satisfaction with different aspects of food as a component of the tourism product in Croatia. Research results showed that that there is a strong potential to position Croatia as a value added gastronomic destination. Golob, Sirotić i Golob (2014) have researched the quality and the level of satisfaction of tourist in Umag. Research included 14 motives, and good food was on second place, graded with high 4.09 on the 5 point Likert scale. Same research showed that among the eight activities in destination included in the research quality of food in restaurants and richness of gastronomic offer are best rated (3.9 on the 5 point Likert scale). This is quite promising, but it also shows that there is still lot of work to do in improving gastronomic tourism offer in Croatia, since there is a difference in grade for food as motive for traveling (4.09.) and satisfaction of tourist with gastronomic offer in destination (3.9). Research results provided by Pranjić (2012) have shown that typical Dalmatian dishes and desserts are on average very poorly represented in Dalmatian taverns, while wines are relatively well represented. However, there are some positive examples which result with higher satisfaction of tourist. Two of them are shown and explained in the paper and can represent a starting point for entrepreneurs for

gaining ideas to create gastronomic offer which will be a competitive advantage for the destination and the whole country.

The potential of gastronomic heritage in Croatia provides exceptional opportunities for sustainable tourism growth and development. Quality and excellence should be an imperative when it comes to an authentic gastronomic story. Diversity of heritage and the way of life of local people represent a strong base for an authentic product. The increasing number of positive examples of products and events in tourism practice, based on gastronomic heritage, are evidence that Croatia can significantly improve its recognition and authenticity in the global tourism market.

Due to this fact, authors wanted to explore and present examples of good practice which could serve as benchmark for entrepreneurs and destinations while developing eno-gastronomic offer. In-depth interviews are the best method to understand the standpoint of the entrepreneurs who run chosen projects. To gain the primary research sample, authors used expert judgement method which provided 20 units in the sample. Second step included focus group with 10 students. Students were asked to grade authenticity, attractiveness and possibility of providing competitive advantage for every unit in the sample (there were 15 different elements graded). Three best rated units were planned to be interviewed, but only two interviews were conducted. In order to explore the motives and goals of launching top projects in Croatian tourism, based on tradition and local gastronomic heritage, interviews were conducted with the conceptual initiators of these projects. Ambitious individuals, dedicated to their work have realized the potential of gastronomic heritage for Croatian tourism, and have provided an added value and recognition of their destinations on the global level.

Chefs' Stage – International Gastronomy & Hospitality Congress

The leading gastronomy congress in Croatia and this part of Europe, which has takes place in Šibenik since 2018, has been recognized as a top gastronomic event that brings together numerous professionals in the hospitality and tourism industry, as well as related activities. Chefs' Stage functions as a kind of gastronomic platform aimed at connecting stakeholders in the hospitality industry and promoting local Croatian gastronomy in the world. The event was started by the owner and chef of the award-winning Pelegrini restaurant, Rudolf Stefan. His culinary philosophy is based on a creative blend of traditional and modern, and his gastronomic heritage is an inexhaustible inspiration. The Pelegrini Restaurant is Michelin starred. Several goals have been set in organizing this event. Chef Štefan emphasizes local Mediterranean and regional gastronomy, which is worthy of international attention, but also emphasizes the foundation for educating young talents in gastronomy and improving their knowledge at prestigious international culinary academies.

Also, one of the goals of this event is to gather as many prominent participants of the regional and international gastronomic scene as possible: chefs, hoteliers, premium food producers, suppliers, as well as guests and tourism journalists. Event emphasizes sustainability, gastronomic heritage and tradition, local food production and cultivation, and sharing of knowledge and experience in a friendly atmosphere among all related stakeholders. An important part of the platform is the Be Foodie Foundation, which provides funding for young talents aged 16 to 26 in the gastronomy and hospitality industry. In addition to its strategic partners, the Be Foodie Foundation has already sent 3 scholarship holders to prestigious international academies in the first year: Le Cordon Bleu Istanbul, Intrecci Academy and the Ecole Nationale Supérieure de Pâtisserie Ducasse & Thuries. The type of education and

institutes are selected by personalized approach so that the whole process of education and training is better suited to the skills and characteristics of the candidates. Every year, the event gathers more and more participants. Over 600 people participating in theme events, four masterclasses, six gala dinners at unique cultural heritage sites of the destination, some of which are part of UNESCO's protected cultural heritage in Croatia which shows the importance of promoting local gastronomic heritage and traditional culinary knowledge in the global eco-gastronomic scene. The idea of organizing such project came from need for a stronger promotion of Croatian gastronomy and fostering dialogue on the topic of gastronomic heritage, learning about traditional culinary knowledge, as well as polemizing about contemporary challenges and trends in the gastronomic scene.

Roxanich Wine & Heritage Hotel, Motovun, Istria

The concept of Roxanich Wine & Heritage Hotel is based on a blend of luxury in the hotel industry and top small wineries with a strong presence of tradition and cultural heritage in all elements of the business. Winemaker, Mr. Mladen Rožanić, in the small Istrian town of Motovun, decided to realize a truly special project in the hotel industry, related to the wine and gastronomic heritage of the area. The hotel is characterized by unique architecture adapted to the micro location and the area in which it is located. The hotel has 32 accommodation units within the 1902 Old Wine Cellar building, which are conceptually quite different. Particular emphasis in the facility is placed on the top quality of the gastronomic offer. In addition to the large hotel restaurant, the facility is special because of the fact that the wine cellar and premium wine production facility are located below the hotel. The winery and all the auxiliary rooms, including spaces intended for aging wine in barrels as well as the tasting room, are located on a total of five floors, partly buried in the grounds. The whole project is guided by the idea of integrating architecture into the environment and the local environment as much as possible. The winery in this unique project forms the basis of the whole project. According to the owner's vision, this concept has been planned and elaborated to the smallest detail, enabling one to provide a unique experience and experience for tourists - from the entry of grapes to processing, through vinification, maturing, packaging, wine tasting to top gastronomic offer in a hotel restaurant and dating premium local wines. The specialty of the cellar, which attracts attention and respect among top wine connoisseurs, is precisely the process of vinification with natural yeasts and spontaneous fermentation as well as the maturation of the wine.

This is exactly what makes the difference between an industrial winemaking and an original one with natural wines. This is a very demanding and unique project containing different components of the offer. Beside a top-notch gastronomic offer of a hotel restaurant and a wine shop, hotel has a polyvalent hall with a large terrace in natural environment, suitable for organizing numerous events, while the third is related to the experience of the "wine story" embedded in the wine cellar architecture. Stakeholders and members of the project team particularly emphasize the importance of elaborating the whole concept of the project, which aimed to tell a specific Motovun, local story. It is also a story of unique architecture and design embedded in the tradition and local culture of the area. The whole project is actually a group of different motives and unique experiences with experiencing spaces connected by tradition, culture and especially food and wine. This family, guided by the philosophy of an experienced Mr. Mladen in the wine business, has created and offered new, innovative concept of creating experiences and storytelling in tourism. The possibility of emphasizing the personality of the owners of small family hotels became a competitive advantage of this and similar stories in tourism.

Quality projects and events closely related to and motivated by gastronomy can contribute to raising the level of quality of gastronomic offer and better valorisation of gastronomic heritage in the overall tourism system. At the same time, sharing knowledge and assisting young people in their professional development, as in Chefs' Stage, gives added value and contributes to the competitiveness of the tourism product. Also, a special contribution to the realization of these and similar projects is reflected in raising the level of knowledge of the local population about the resource base of Croatian gastronomic heritage.

6. Conclusion

Famous English novelist and publicist George Bernard Shaw said that "There is no more genuine love than love for food." Today, gastronomy is among the leading motives for traveling. The importance of gastronomy in sustainable tourism development in Croatia is also increasing. The richness of gastronomic heritage and the possibilities of valorisation in numerous special interest tourism types, leads to conclusion that Croatia is an example of a destination that slowly builds its identity on the global tourism market based on various parts of its rich heritage, no longer relying solely on natural heritage. There are still many challenges when it comes to better use of cultural heritage in tourism. One of the key preconditions is to achieve a better recognition of the gastronomic heritage among the local population, as well as to achieve stronger cooperation of key stakeholders when it comes to the implementation of tourism projects. One of the important visions and goals set in the Tourism Development Strategy is establishing Croatia as a gastronomic icon of Europe. A key role in this process belongs to rich treasure trove of gastronomic heritage and local production, as well as authentic flavors. These original flavors represent the starting point for tourism marketing, which is visible in the Croatian Tourist Board's "Croatia - Full of flavors" promotional campaigns. The Mediterranean diet is one of the most famous in the world. Croatia inherits all its elements, conditioned by ecological, climate and cultural-historical factors. An additional motive for a stronger valorization and preservation of Mediterranean diet is the fact that it is on the UNESCO list of protected goods. An increasing number of initiatives for organizing events to promote and popularize local gastronomic heritage and other projects motivated by authentic gastronomy contribute to improving the quality of the tourism product and recognizing Croatia as a famous gastronomy tourist destination.

DEMARKETING AS A STRATEGIC TOOL FOR SUSTAINABLE DEVELOPMENT OF TOURISM – THE CASE OF THE CITY OF DUBROVNIK

ABSTRACT

Aims of the paper: This paper aims to analyse the practice of demarketing as a tool for a sustainable tourism development strategy in the case of Dubrovnik tourist destination. This is a research area of particular importance in an era of growing concern for sustainable tourism development.

Methodology: The paper will analyse the strategic documents of the City's development as well as other demarketing practices in the destination in order to identify which model of demarketing (tourist flow management) is currently present in the Dubrovnik tourist destination. In addition, a comparative analysis will be carried out with several foreign tourist destinations.

Results: By analysing the available scientific literature, the authors will establish whether, and to what extent, the model presented differs from the so far known and researched similar models in the practice of tourism destination management. The purpose is to define conceptual frameworks for demarketing practices in tourism destination management that aim to "calm" tourist flows, particularly in sensitive tourist destinations. A limitation of the research is that the paper explores demarketing practices and tools in public sector institutions (city, tourist boards), but does not cover demarketing practices in private companies and other institutions. The authors suggest that the research area can be extended to include demarketing practices in the private sector as well as other related institutions, and that the analysis be extended to more case studies. The authors expect that this paper will assist tourism and other public policy makers in the presented and other similar tourism destinations in adopting effective sustainable development measures, as well as decision makers in strategic management in the private sector, particularly in the harmonization of private and public sector in achieving efficiency and sustainable tourism development.

Key words: *sustainable tourism, sustainable development strategies, demarketing, UNESCO protected cultural heritage sites, tourist destination management.*

1. Introduction

The focus of strategic management of sustainable tourism development is placed progressively on the level of tourist destination. Tourist destination becomes a key place and a "focal point" for tourism management of receptive community, but also a meeting point of all *stakeholders*

in the destination. In such way, the management of tourist destination is entrusted with and "responsible" for sustainable tourism development in receptive community, whereat, in addition to meeting the needs of tourist visitors, the needs of local population and investors, as well as other key *stakeholders* in the tourism system should be considered. In this context, it is quite justified that the key platform in considerations about directions of development in tourist regions is placed precisely on the level of tourist destination.

In the field of destination management, the interest of the scientific community and the professional public is focused on strategic development, sustainability management, branding and marketing of tourist destination and similar issues that are crucial for the development of touristic receptive community. However, in an age of increased concern for the limits of sustainable development, as well as observable tourist saturation of many world-renowned tourist destinations, which also means the loss of its basic attractiveness and significant weakening of the quality of life of local population, there is growing concern about the future of many developed destinations, so the attention is primarily drawn to sustainable development.

In this sense, it can be said that the sustainable development of tourist destinations has been under investigation for a long time, but when placed in the context and framework of strategic management, marketing and branding of tourist destination, it seems that there is a lack of systematic approach and that operational plans and actions in destinations are reduced to different individual cases in which each destination, in its own peculiar and specific way, addresses the problem of limits of tourist development and selective slowing of tourist growth, almost by the "trial and error" method.

In this regard, the aim of the research in this paper is to examine the extent to which the scientific community has responded to a question of systematic approach to sustainable strategic management and limits of growth in tourism, and to explore the same question on the example of Croatia's most famous and most developed tourist destination - the City of Dubrovnik. Accordingly, the paper will also compare several world tourist destinations that also face the issue of tourism overgrowth, followed by the case study of the City of Dubrovnik. The key strategic development documents of the City of Dubrovnik were analysed to examine which tourism demarketing activities were included in those strategic documents.

It is expected that this paper will contribute to a theoretical understanding of the issues outlined, but also to be a useful practical guide for makers of strategic decisions about economic and social development, both in the public and private sectors.

In addition to the theses on the recommended application of case study methods (e.g. Fullerton et al., 2010), the methodological framework for the research in this paper was created on the basis of guidelines for further research on the original article on demarketing of Kotler and Levy (1971), tailored to the destination management system, whereat the "companies" system was replaced by "destination management". It is a question of the following research guidelines: "… 1. What demarketing policies and instruments are commonly used by these companies? How do companies reduce total denial and selective demand? How do they allocate scarce products? What are the optimal marketing policies for different demarketing situations? (Kotler & Levy, 1971, 80). "These are also the key research issues addressed in the paper, customised for the strategic management system in tourist destinations on the example of the City of Dubrovnik.

2. Demarketing and the limits of growth

In studying the scientific literature, which would denote a new paradigm of growth with one term and concept, by which the growth, being paradox in terms of economic development, is stopped or slowed down, has led us to the concept of demarketing. Demarketing seems to be one, if not the only, unambiguous term denoting conscious activities to stop, select or slow

down demand, driven by the concern for sustainable development and the rapid growth of demand and accordingly consumption. This concept is first revealed in the previously mentioned, well-known article by Kotler & Levy, 1971, Demarketing, Yes, Demarketing, whose thesis is based on the work of Luke from 1969, in which he advocates a broader view of marketing paradigms, introducing a new, social dimension into marketing. Kotler's & Levy's paper was published a year before *Limits to Growth*, a very early portent of the current agenda.

In april 1968, a group of thirty individuals from ten countries-scientists, educators, economists, humanists, industrialists and national and international civil servants-gathered in the *Accademia dei Lincei* in Rome. They met at the instigation of Dr. Aurelio Peccei, an Italian industrial manager, economist, and man of vision, to discuss a subject of staggering scope-the present and future predicament of man…Out of this meeting grew *The Club of Rome*, an informal organization that has been aptly described as an "invisible college." Its purposes are to foster understanding of the varied but interdependent components-economic, political, natural, and social-that make up the global system in which we all live; to bring that new understanding to the attention of policy-makers and the public worldwide; and in this way to promote new policy initiatives and action. ("The Limits to Growth", Meadows et al., 1972.). Members of the *Club of Rome* have published a book, "The Limits to Growth", which has become synonymous with sustainable economic development. Moreover,since the 1972 publication of the *Club of Rome* study *Limits to Growth* the term has come to refer to both population and economic growth – that is, growth in population and growth in per capita resource use, the product of which gives the growth rate of total resource use. This total resource use is a flow from nature's sources (mines, wells, forests, fisheries, grasslands), through the transformations of production and consumption within the economy, and back as wastes to nature's sinks (atmosphere, oceans, a neighbor's back yard). … The limits to growth, in twenty-first century usage, refers to the limits of the ecosystem to absorb wastes and replenish raw materials in order to sustain the economy (the two populations of dissipative structures). The economy is a subsystem of the larger ecosystem, and the latter is finite, non-growing, and, in terms of materials, closed. (https://www.encyclopedia.com/social-sciences/encyclopedias-almanacs-transcripts-and-maps/limits-growth)

The report of the *Club of Rome* "Limits to Growth" was not the first document presented to the world public which forewarned that the existing world economic system as a whole, capitalist and socialist, was unable to secure the future of humanityThe "Limits to Growth" is written based on the first numerical model of the world economy, developed by Jay Forrester of the Massachusetts Institute of Technology (MIT). The model demonstrated a catastrophic image of the linear extrapolation of the then prevailing world economy and became a world advocate of zero-growth (Pravdic, 1993, 358). In view of the many controversies that the model of limits of growth has caused, seventeen years later the *Club of Rome*, with the review of E. Pestel, revised many of their standpoints. It is important to mention that the *Club of Rome* has since abandoned the imperative of zero growth. (Pravdic, 1993, 359).

Pravdic (1993, 359) notes that, in the report of the Brandt Commission (ICIDI, 1980), among other things, it is explicitly stated: "It can no longer be maintained that environmental protection is a constraint on development. On the contrary, the natural environment is an important development factor." It should be pointed out that the international community has developed the concept of sustainable development through a series of, mainly political, recommendations for further activities. However, it is up to the sciences to determine indicators for identifying and assessing the sustainability of development and find ways in which they can be implemented. "This seemingly routine task has many limitations."(Pravdić, 1993, 357)

In this regard, Kotler and Levy place marketing in the context of the limits of growth, introducing the term and concept of demarketing. They are actually "pushing the field of

marketing in new directions" (Harris, 2007, 7). In studying Levy's work, Harris states that Levy, while reconsidering the existing marketing paradigm, has added an interdisciplinary perspective to solving marketing problems, ... and that "encouraging philosophical pluralism" is in marketing (Harris, 2007, 7).

Kotler, in his later review titled *Welcome to the Age of Demarketing*, states: "Today many people are concerned about the planet's" carrying capacity "to provide the resources on the scale needed to support the world's growing populations and the needs of these and future generations. The "ecological footprint" concept says that we would need the equivalent of six to eight more earths of resources if all people in the world want to achieve the US living standard at the current rate of resource consumption. One generation can exploit existing resources - oil, water, air, timber, fish - so intensely that the next generation is doomed to accept a lower standard of living. (Kotler, 2017) It can be seen that the essential concept of demarketing is based on sustainable approach to production and consumption, whereat "ecological footprint", that is, concerns about (uncontrolled) growth in consumption and thus the limit of growth are added to marketing activities.

It should be noted that there is a link between demarketing and social marketing. Kotler i Zaltman (1971) navode definiciju Social marketinga: "Social marketing is defined as the design, implementation, and control of programs calculated to influence the acceptability of social ideas and involving considerations of product planning, pricing, communication, distribution and marketing research." In that regard, the following considerations are also interesting: "Social marketing is an approach used to develop activities aimed at changing or maintaining people's behaviour for the benefit of individuals and society as a whole. Combining ideas from commercial marketing and the social sciences, social marketing is a proven tool for influencing behaviour in a sustainable and cost-effective way." (https://www.thensmc.com/content/what-social-marketing-1)

It is clear that social marketing promotes the social idea of sustainable development, while demarketing reconstructs the existing marketing paradigm by implementing the idea of sustainable growth into a marketing concept. In the aforementioned article, for which there is a general consensus that it is a pioneer in demarketing, Kotler & Levy state: "Popular conception on marketing is that it deals with the problem of furthering or expanding demand" (Kotler & Levy, 1971, 75). They define the term demarketing as the term opposite to the above, and state that demarketing is "the aspect of marketing that deals with discouraging customers in general or a certain class of customers in particular on either a temporary or a permanent basis." (Kotler & Levy, 197, 76) The authors list and describe three types of demarketing:

1. General demarketing, which is required when a company wants to shrink the level of total demand,
2. Selective demarketing, which is required when a company wants to discourage the demand coming from certain customer classes,
3. Ostensible demarketing, which involves the appearance of trying to discourage demand as a device for actually increasing it. (Kotler & Levy, 1971, 76).

It is interesting to point out that the same authors identify both the short-term (tactical) and long-term (strategic) dimensions of demarketing, stating: „Its short-run task is to adjust the demand to a level and composition that the company can, and wishes to, handle. Its long-run task is to adjust the demand to a level and composition that meets the company's long-run objectives. (Kotler & Levy, 76.)"

There followed analytical studies on the application of demarketing, first and foremost, in business entities – companies and firms, as part of promotion as an element of the marketing mix, but also as part of a differentiation strategy (e. G. Gerstner et al., 1993). Among the first studies are those in the health sector, where demarketing is presented as means for reducing smoking and inappropriate health care consumption. (e.g. MacStravic, 1995; Lawther et al.,

1997) Lawter et al. are committed to implementing demarketing strategies that will „ensure that none of the parties involved would be inconvenienced or disadvantaged" (Lawther et al., 1997, 315). In their book *Demarketing*, Bradley & Blythe state that "there is no typology of marketing" and that demarketing is a segment of strategic marketing. They state that „demarketing can…curtailing demand, yet (crucially) not destroying it" (Bradley & Blythe, 2014, 1). Today, part of the research focuses on the so-called *green demarketing* (e. g. Armstrong Soule & Reich, 2015)

There is a generally accepted consensus among authors that there is no conceptual framework for demarketing: its limits are unknown, and there is a problem of its generally accepted definition.

3. Strategic approaches to tourism demarketing

Works about the area of tourism sustainable development date some twenty years back. Among the first to approach the issue of the limits to tourism growth in a more systematic way were Beeton and Benfield who state that their paper from 2002 "introduces 'demarketing' as a policy option and management tool…"and advocate the fact that "demarketing can be applied to tourist management and planning" (Beeton & Benfield, 2002, 497). The same authors are strong advocators of demarketing in tourism stating that „The implications (of demarketing strategy) for the tourism industry are enormous, providing fresh ways to consider the management of mass tourism and the environment and culture on which it relies." (Beeton & Benfield, 2002, 497). On the other hand, Medway and Warnaby declare that their work "provides a unique counter to the 'conventional wisdom' of place marketing by introducing the concept of place demarketing…which more explicitly accentuate the negative, rather than accentuating the positive which is the norm in this marketing context" (Medway & Warnaby, 2008, 641). The first destinations to have studied visitor management and visitor impact are: Scotland, Canada, Australia and New Zealand. (Garrod et al., 2006; Leask & Fyall, 2006).

As the most significant theoretical model for the research in this paper and as the most relevant for the investigated issues, the authors chose the thesis of author Sadiki (2012), who studies sustainable tourism in WHS (World Heritage Sites), whereat the Visitor Management area is of particular importance. He recommends demarketing as a desirable direction for sustainable tourism development, citing Fullerton et al. (2010), that there are five models of a demarketing strategy:

1. "educating potential visitors,
2. marketing to desirable markets sites which allows sites to attract conscientious visitors, treating a site with respect,
3. to publicize other sites as alternative destinations; this would spread the number of tourists over a broader area decreasing environmental impact on one particular site…which is particularly effective in condensed areas,
4. to utilize a seasonal schedule for access, which allows tourists to visit during certain parts of the year, while also allowing the site "off season" time for preservation efforts to take place,
5. to make access to fragile areas difficult or restricted" (Sadiki, 2012, 22-23).

Mason (2005) previously states a subtler classification of demarketing activities and cites Kuo (2002) who advocates a "hard" and "soft" approach to tourism demarketing, which is also viewed by both authors primarily through a prism of visitor management. He states the following: 'Hard' visitor management approaches involve physical management, regulatory management and economic management. 'Soft' approaches make use of education and interpretation… While the approach of managing impacts has its merits, and has met with some success, it has tended to assume that the visitor is 'guilty until proven innocent' (Mason, 2005,

181). By exploring in his work approaches to visitor management in protected natural areas in New Zealand, Australia and Antarctica, the same author advocates "more holistic perspective to be employed, in which the visitor can be put within a context that includes both the destination community and the environment visited. Such an approach, it is argued, should not only lead to better informed and behaved visitors, but a reduction in negative visitor impacts." (Mason, 2008)

Similarly, in the paper of Medway et al. there are several strategies within the place-demarketing process: „No marketing; redirection/marketing alternative places; informational place demarketing; restricting access; and pricing mechanisms" and proceed: „Four main rationales for demarketing places were identified: sustainability of the place product; market segmentation and targeting; reducing the effect of seasonality; and crisis prevention/management." (Medway et al., 2010, 124)

The findings of the empirical research in this paper should answer whether Dubrovnik "fits into" the models presented with its demarketing activities. The findings of the comparative analysis should contribute to understanding whether there is specificity in particular types of tourist destinations in the application of the marketing strategy.

4. Consequences of Overtourism and Management Responses - comparative analysis

In considering the causes of overtourism, it is important to recognise that tourists and day visitors are not the only users of the destinations where over tourism is emerging as an issue – overcrowding on public transport is both experienced and caused by locals, commuters, visitors and tourists and compounded by a lack of infrastructure investment. Tourism can displace other commercial activities and colonise residential areas so that, for example, in 2012 Venice now has a residential population of 57,000, down from 174,000 in 1951, in 70 years Venice has lost two-thirds of its resident population, displaced by tourism. Tourism is the commercial monoculture of Venice. (Goodwin, 2017, 15)

The growth in tourism is driven by forces over which local governments have no control over the numbers arriving. In Barcelona and Venice, the day visitors arrive by coach, cruise ship, train or plane in numbers which the city government cannot control. The management of this infrastructure which makes mass tourism possible is in the hands of national government which receives much of the tax but does not have to manage the impacts. The political pressure of street demonstrations and elections is directed at local politicians who do not have the levers to reduce demand, although Barcelona is rebalancing its tourism budget to spend more on management and less on promotion. The focus on ever-increasing international visitor arrivals, rather than yield, the economic benefit of tourism, has distorted the way that national policymakers are judged on their tourism stewardship. Using Gross Value Added would be a significant improvement, a cost-benefit analysis or a net value figure for tourism would make for better decision-making. (Goodwin, 2017, 13)

There follows a comparative analysis of demarketing in several selected tourist destinations facing the phenomenon of overtourism, according to Goodwin (2017).

Table 1: Selected tourist destination facing the phenomenon of overtourism classified by prevailing responses to this phenomenon

Public Protests	Government taking action	Issue raised
Barcelona, Venice, San Sebastian, Berlin, Palma (Mallorca), Iceland	Iceland, Seoul, Cinque Terre, **Dubrovnik,** Amsterdam	Scotland: Edinburgh, Orkney & Skye ; Italy: Florence, Palermo, Capri; Ireland, Balearics, England, Halong Bay; Rio, Brazil; Peru, Portugal; USA; Cuba, China, Everest, Prague, **Croatia,** Crete

5. Demarketing as a strategic tool for sustainable development - case study – the City of Dubrovnik

A qualitative analysis of the case study of the City of Dubrovnik, Croatia's most developed tourist destination which most famous attraction - the Old Town of Dubrovnik - , has been included in the UNESCO-listed WHS - World Heritage Sites since 1979, is presented in this section of the paper.

Table 3 shows a qualitative analysis of the strategic documents of the City of Dubrovnik with a specification of sustainable tourism development activities. It is an analysis of four key strategic documents of the City, which include the measures for sustainable development of tourism that were adopted for different strategic periods. The following were analysed for each document: the period for which the document was adopted, the governing body that adopted it, the area of activity, the specification of activities, the modes of implementation of individual groups of activities and the performance indicators, which is very important for the possibility of systematically monitoring the achievement of strategic activities defined by the plans.

Table 3: Qualitative analysis of strategic documents of the City of Dubrovnik with a specification of activities for sustainable tourism development

Strategic document	Period for which the document is brought/will be brought	Which body adopted the document	Area of activity	Specification of activities	Methods of implementation	Performance indicator
Strategic plan of the City of Dubrovnik 2018-2020[1]	2018-2020	City Council of the City of Dubrovnik	Destination management	1. Promotion of tourism through the following activities: winter festival, development of projects to promote cultural tourism and implementation of the project "Respect the City". 2. Establishing the concept of a smart city 3. Improvement of transport infrastructure, water management and environmental protection (noise and waste management)	1. Improvement of the city's tourist offer through the implementation of joint programs with the Dubrovnik Tourist Board, incentives for improving the tourist season (establishment of new routes), encouraging the development of rural tourism (preparation of a status analysis, info workshops and payment of support to farms), cultural programs and events (organised also in foreign languages), winter festival (extending the offer in winter), developing the promotion of cultural tourism project (project 2nd Chance funded by URBACT III program) 2. Implementation of the project "Respect the City" - Phase I of the project accomplishment, development and implementation of the Office for Management and Development of the Smart City Dubrovnik ("DUSC Office of the Smart City") and the establishment of	1. Increase in number of overnight stays 2. Number of implemented projects 3. 6. Research results and discussion

Based on the above mentioned basic models of demarketing in tourist destinations, an overview (Table 4) was carried out as to what extent and in what way a demarketing strategy was implemented in the strategic documents of the City of Dubrovnik, with the aim of sustainable tourism development and visitor management. Ongoing activities or the already completed activities are presented, while the strategic analysis of documents and projects under development is omitted.

Table 4: Presentation of implementation of demarketing strategy in tourist destinations in the strategic documents of the City of Dubrovnik according to three theoretical models

Author – strategic model	Demarketing strategy models – areas of activity	Strategic document and period	Specification of activity	Methods of implementation
Fullerton et al., 2010; Sadiki, 2012 – model 5 demarketing strategy	1. educating potential visitors, 2. marketing to desirable markets sites which allows sites to attract conscientious visitors, treating a site with respect, 3. to publicize other sites as alternative destinations; 4. to utilize a seasonal schedule for access, which allows tourists to visit during certain parts of the year, while also allowing the site "off season" time for preservation efforts to take place, 5. to make access to fragile areas difficult or restricted	Strategic plan of the City of Dubrovnik 2018 - 2020	1. Development of cultural tourism promotion projects 2. Implementation of the project "Respect the City" 3. Rural development tourism 4. Winter festival, 5. Establishment of the concept of a smart city	1. Cultural programs and events in Croatian and foreign languages 2. Phase 1 of the implementation of the project "Respect the City" 3. Rural tourism development 4. Realisation of the winter festival 5. Establishing a digital platform for the smart city Dubrovnik

Source: Authors' research

Based on the conducted comparative analysis of selected tourist destinations (Goodwin, 2017) in Tables 1 and 2, it can be concluded that there is an increasing number of developed tourist destinations that face the problem of overtourism, and they all try in their own way to find different measures and activities seeking to respond to this phenomenon, thus confirming the author's thesis, cited in the introduction, that there is no universal, commonly applicable strategic model of demarketing for developed tourist destinations. It is interesting to note that these measures are most often operational or tactical, so it is important to set them at the strategic management level.

By investigating the case study of the City of Dubrovnik, it was perceived that there were as many as four strategic documents of the City which include different forms of demarketing i.e. measures aimed at sustainable tourism development. It is noticed that some of these documents are still being prepared, so it can be concluded that Dubrovnik, driven by the phenomenon of overtourism, has only recently started implementing measures for demarketing and sustainable development of destination.

Finally, by examining the extent to which the case of Dubrovnik "fits" into three theoretical models of demarketing in tourist destinations observed, we concluded that almost all of the proposed areas of activity were covered in the case of Dubrovnik. The area that has not been implemented is No marketing (the first strategic direction according to Medway et al., 2010), and the area not covered by this analysis is Pricing mechanisms, as it relates mainly to the private sector.

Particularly noteworthy is the interesting division of directions of demarketing activities according to Mason (2005) into hard and soft demarketing, and in the case of Dubrovnik special mention should be made of planned activities in terms of soft demarketing, such as: educating the population and staff in tourism, investing in the quality of facilities, developing cultural, rural and other selective forms of tourism and the like.

From a theoretical point of view, it should be emphasised that, although only three observable theoretical models of demarketing are elaborated in this paper, each contemporary, new age also brings new challenges, so the observed models should be expanded by new strategic directions that will cover new fields of activity, which in the case of Dubrovnik has been partly implemented, such as, above all: security risk management, the introduction of smart cities technology and sustainable space management. The paper therefore proposes the expansion of the conceptual framework of demarketing, aimed at sustainable development of tourist

destinations, with these three areas of activity, which at the same time represents the basic scientific contribution of this paper.

Guidelines for further research stem from the limitations already outlined in the paper. Therefore, further research is proposed in the following areas: extension of the conceptual framework of strategic action in demarketing and sustainable development of tourist destinations, extension of the research to private sector entities and tourist communities, as well as stakeholder coordination models in tourism destinations for sustainable development, specificities of sustainable development tourism in UNESCO-protected tourist destinations (so-called WHS - World Heritage Sites), coordinated development of demarketing activities and other sustainable development activities in tourist destinations and the like. The authors agree with the thesis of other authors (e.g. Fullerton, 2010) who consider that this topic is insufficiently addressed and that the case studies, comparative and other qualitative analyses are used as methodological tools.

7. Conclusion

One of the basic concerns of all policy makers and strategic decision makers is sustainable development. The limits of growth are becoming one of the key issues in every field of human activity, including tourism. When it comes to conscious management efforts to replace the basic economic paradigm of uncontrolled growth with a new one, which is sustainable development, it can be said that this paradigm shift was created by the establishment of the Rome Club in 1968, but in the scientific context of controlled (and controlling) demand, it was introduced in 1971 by authors Kotler and Levi who presented the term demarketing. Although marketing cannot cover even closely all areas of strategic action towards sustainable development, this concept has served theorists and practitioners as a starting point for management actions in this regard. Therefore, this approach has been used in this paper, which is supported by a few theorists who advocate the application of demarketing in the function of sustainable development in tourism, specifically in the field of destination management and development. In that context, the practical implications of this paper are the following: the paper provides an overview of organized efforts of the social community in terms of sustainable tourism development by defining the limits of tourist growth of a well-known tourist destination - the City of Dubrovnik. This model can serve as a starting point for other similar destinations that also face the problem of overtourism, but it can also serve as a basis for further development and development of the model in the destination itself. It can certainly be useful as a guidepost to other tourism stakeholders - those in neighboring tourist destinations, private sector stakeholders, higher-level decision makers and the like, to direct their activities in the development of sustainable tourism. It is particularly important to emphasize that the presented overview of strategies and tactics of demarketing in tourism in Dubrovnik are also valuable tools - in-depth analysis of the current situation and planned activities - in further strategic directions of strategic decision makers in tourism, primarily the City of Dubrovnik, the Dubrovnik Tourist Board, as well as other stakeholders in the public and private sectors (Port Authority, County Tourist Board, etc.).

By analysing several case studies - tourist destinations that have reached the limits of growth - it can be concluded that destination marketing activities are often made at the tactical as well as operational level, while at the same time there is a significant research gap and a lack of literature and thus a solid conceptual framework in this area. The paper analyses the case of Dubrovnik as a destination that has found its way how to cope with the overdevelopment of tourism, and which, although at the beginning of this journey, has successfully implemented various strategic directions towards controlled tourist development of destination. As it is a

question of a highly successful, most famous tourist destination in Croatia, which has been under UNESCO protection for many decades, it is not surprising that there is a sufficiently developed level of awareness of sustainable development of tourism in that destination.

In this regard, guidelines for further research are also proposed. By resenting an interesting case study of the application of demarketing, for the purpose of sustainable tourism of a particular destination, the authors contributed to the still underdeveloped area of research on sustainable tourism development and its link with concrete measures, activities and strategic guidelines. For this reason, the authors agree with most of the theorists in this field who propose that scientific theory be built through descriptions and comparisons of individual case studies, which will lead to new scientific insights. Therefore, in the authors' opinion, future research should focus on the portrayal of other tourist destinations and their activities (through de-marketing, but also through other strategic guidelines) and on their comparison at domestic and international levels. This is certainly a good way to find the right balance model in the efforts of all stakeholders to align their interests in sustainable tourism. The research area follows two directions: demarketing in natural protected areas and demarketing in cultural protected areas. Generally speaking, these, more developed models of strategic demarketing and other strategic activities in tourist destinations could then become one of the starting points for the development of strategies and policies of tourism development at the county, national and international levels (e.g. EU, UN and similar).

Certainly, it can be concluded that marketing is not the only one, but it is probably a central concept when it comes to sustainable tourism development, especially in fragile tourist destinations such as natural or cultural protected areas. However, success in this regard can only be achieved through a synchronised action by all stakeholders involved, as defined by the 17th UN Sustainable Development Goal: Partnership for the goals. Or, as Sadiki writes: "Tourism is what we make it, hosts and guests, the industry and government, we can make it different."

THE MEASUREMENT OF TECHNICAL EFFICIENCY BY non-radial NR-DEA model IN FOOD PROCESSING SECTOR

ABSTRACT

The issue of efficiency of food processing enterprises is ever-present because of the continuous process of improving the quality standards of raw materials, complying with the procedures in food production, introduction of modern production technology and, above all, due to the large number of actors who are competing for customers in the domestic and foreign food market.
In the coming years Polish food processing sector will be facing significant challenges with the inevitable slow and gradual decrease in the cost advantages of raw materials' prices, as well as ready to eat products. Enterprises, as they constitute the majority in manufacturing business, in the long run will need to determine the efficiency, and hence competitiveness of Polish food processing sector.
The aim of the paper is to review the domestic and foreign literature in terms of classification and systematization of the concept of technical efficiency in food processing sector in Poland. In the theoretical part of the study methods of descriptive, comparative, deductive and synthetic analysis are used. In the practical part of the study appropriately selected non-radial NR-DEA model adequate for technical efficiency measurement is presented. The results of the analysis is based on the results of authors' own calculations, as well specific findings from business practice both from inland and abroad.

Keywords: efficiency, effectivity, technical efficiency, food processing, Poland.

1. Introduction

Food economy is one of the most important sectors of economy in every country because of its significance for production and employment, but above all, in connection with the supply of food to the society. Food economy is a collection of many different economic systems that influence organizational structure, methods of operation and financial performance of the production chain actors. Entities in the food processing sector operate in an environment with high exposure to the risk of business activity (Zielińska-Chmielewska, 2014).

Food processing enterprises strive for continuous and steady supply of raw materials to carry out production which would correspond to the changing needs and preferences of the consumer. The food market is an arena where various operators, which are different in character, intensity, strength and direction of impact, come into play. One of the main obstacles for food processing enterprises is the difficulty of obtaining stable and predictable income which would guarantee the continuation of production and remaining a going concern. What is characteristic and typical for agriculture and agro-food industry, is the fact that prices of raw materials fluctuate all-year round but retail prices of finished products remain relatively rigid. All of the above strongly affect the efficiency of the agribusiness operators in the market. In Polish food processing enterprises occurs concentration and integration between entities in the production chains, which has accelerated after Poland's accession to the European Union. Existing foreign publications in this field based on decades-old experiments confirm the need for conducting multi-step quantitative and qualitative research, in which systematic identification and evaluation of the financial efficiency of food processing enterprises can be made. On the basis of theoretical analysis and empirical results of previous studies, a hypothesis has been formulated. The technical efficiency of food processing enterprises results from optimizing the use of analyzed factors affecting the level of productivity achieved by the examined enterprises.

The paper consists of 5 sections: *Introduction*, which defines the problem, subject matter and puts forward the hypothesis of the research, *Discussion on the classification of efficiency measurement in the economic studies* defines effectivity including modern context with crucial points referring to current knowledge based on the relevant results of recent research, presentation of *Methodology, empirical data and analysis* subjected to re-testing existing documentation background, *Results and discussion on the assessment of technical efficiency* focused on explaining its economic significance and insights, and *Conclusions* supplemented by verification of the hypothesis, assessment of research results, attention to problems which occurred and limitations of the research, guidelines for future research and assessment of institutional and systemic implications and solutions for current state of research. In the last section of the article *References* are listed.

Developing research on the efficiency of food processing enterprises is extremely needed and constitutes a useful tool for policy makers on the food market in terms of obtaining information about the validity of its operations, the need to make the necessary modifications, eliminating the potential risk of operation, and thus minimizing risk of bankruptcy and liquidation (Zielińska-Chmielewska, A., Alihodzić, A., Smutka, L., 2019, p. 1087).

2. Discussion on the classification of efficiency measurement in the economic studies

The article reviews domestic and foreign literature in order to present and make the necessary comparison of the technical efficiency concept, methods of measuring it, taking into account various advantages and disadvantages of its use. The study applies method of analysis and reasoning, and in particular the methods of descriptive, comparative, deductive and synthetic analysis. The results of the analyses are based on the results of authors own research and studies.

It has to be mentioned that economic effectivity is the primary valuation standard in economics (Wilkin, 1997, p. 25). But it should be distinguished from the English-language word effectiveness, often translated into Polish as *skuteczność*, meaning that a desired effect was eventually achieved by more or less effective method. Effective operation does not mean that it was at the same time efficient. For the process to be efficient and effective, goals must be properly planned, and the results have higher value than costs.

Table 1: Comparison of economic processes according to the criterion of efficiency and effectiveness

The economic process	Efficient	Inefficient
Effective	planned economic objectives of the process are achieved, and the final results are of higher value than expenditures set for the planned economic objectives	Planned economic objectives of the process are achieved, but the final results are of lower value than incurred expenditures
Ineffective	Planned goals of the economic process are achieved, but the value of final results is higher than incurred expenditures	planned economic objectives of the process are not attained, and the value of final results is lower than incurred expenditures

Source: own study based on: Szymańska, 2011, Effectiveness of farms specialized in the production of pork in Poland; Nowosielski, 2008, The efficiency and effectiveness of business processes

In the systemic approach efficiency is the ability of a company to shape its environment, so that it becomes favorable, and the ability to overcome any obstacles. From this perspective, businesses are open systems that try to optimize the processes of acquisition and use of scarce resources from the environment. In this way, they are able to gain or maintain a competitive position. Therefore, effectivity is the ability to overcome the uncertainty surrounding the company. The essence of effectivity are incurred expenditures, transformation processes and final results. Evaluation of effectiveness involves identifying the ability to obtain resources, and then determining the extent of their use.

The economic efficiency of analyzed entities can be measured by three different methods: indicative, parametric and non-parametric. In the article the economic efficiency is being measured by using data envelopment analysis (DEA). This method has been very often used to assess the efficiency of public sector, non-profit institutions and institutions (Emrouznejad, Yang, 2018). Charnes, Cooper and Rhodes (1978) were the first ones who described DEA approach and applied the CCR model to measure productive efficiency frontier based on the concept of Pareto optimum on the basis of Farrell assumptions (1957). This approach considers how much the total efficiency in the financial sector can be improved and ranks the efficiency scores of decision-making units (DMUs). The DMUs are usually described by several inputs that are spent on the production of several outputs. DEA efficiency measurement derives from analyzing empirical observations obtained from DMUs to define productive units, which are characterized by common multiple outputs and common designated inputs (Charnes et al., 1978). DEA is most useful in cases where accounting and financial ratios are of little value, multiple outputs are produced through the transformation of multiple inputs, and the input-output transformation relationships are unknown (Charnes et al., 1978).

To me mentioned that studies using DEA are mostly centered on deriving a summary measure of the efficiency of each entity, estimating targets of performance for each entity and identifying the model of best efficiency entity. Additional uses for DEA, f. ex. in banking include the measurement of efficiency in light of resource and output prices, the estimation of operating budgets that are conducive to efficiency, the assessment of financial risk at bank-branch level, and the measurement of the impact of managerial change initiatives on productivity (Thanassoulis, 2001).

Besides the DEA approach, the most common approach for measuring the economic efficiency is the ratio analysis. This approach can measure the overall financial situation but the weakness

of ratio analysis is the lack of agreement on the relative importance of various types of input and output (Jurčević, Mihelja Žaja, 2013).

3. Methodology, empirical data and analysis

Based on literature, it can be concluded that the concept of the efficiency consists of efficiency and flexibility. Efficiency (also known as economic effectiveness) includes economic, technical and non-economic efficiency. The economic effectiveness can be viewed from two independent perspectives: financial and productivity-related. Non-economic efficiency includes organizational, operational and dynamic efficiency. Economic efficiency is the ratio of the obtained result to inputs. According to the principle of rational economy, it means that certain results should be achieved at the lowest expenditures (costs) possible, or the best possible result should be obtained with a given quantity of inputs (costs). The higher the efficiency is, the greater result per unit of effort is. Efficiency is applied both in assessing the effects which are quantitative nature (as a ratio of the effects to expenditures) and qualitative (as the ability to achieve the desired effect). Methods commonly used for assessing overall efficiency are based on three approaches: relying on ratio, parameters and non-parameters. Since this article presents analysis and evaluation of overall efficiency (financial) by means of ratios, technical efficiency by means of non-parametric DEA method and organizational efficiency measured by quantitative and qualitative methods, these methods should be explained better.

Table 2: Presentation of used methods, techniques and research tools

Research subject	Measure-ment method	Subject, territorial-temporal scope	Method of data acquisition	Tools and research techniques	Current application of methods
evaluation of technical efficiency	quantitative	database includes entities operating in the meat sector in Poland	financial database for the purpose of research	indicator analysis methods, positioning methods, dynamic analysis	A few analyses in Poland and in the world

Source: authors

In-depth, long-term analyses carried out since 2012, supplemented by data from the Central Statistical Office of Poland enabled to create database of 695 meat enterprises located in Poland in the period 2010-2017. Raw data for analysis came from Polish Monitors "B", a specialist financial database of EMIS Intelligence, supplemented with financial statements in the form of balance sheets, profit and loss accounts, cash flows of the surveyed entities from the National Court Registers. The analyzed 53 poultry meat enterprises[1] represent 15% of the operating poultry meat enterprises. The basic criterion for selecting a sample for the study was:

a) subject of conducted activity according to PKD 2007 - classes 10.12 and 10.13, b) location within the country, (c) keeping the financial statements for the years 2012 to 2017, d) no bankruptcy or liquidation, e) raw material processing volume (t/week), number of employees (full-time), volume of revenue (PLN/year). Clarified data from the poultry meat enterprises were used in the research in order to implement non-radial efficiency DEA model.

---

[1] Meat processing enterprises were classified according to the volume of processing raw material, such as: tons/day, see also: Dz. U., 2004, nr 173, poz. 1807.

3.1. Technical efficiency – concept, the advantages and disadvantages of parametric and non-parametric approach

Therefore scientific research and economic practice increasingly often use measures constructed on the basis of microeconomic definition of effectiveness (Domagała, 2007; Mielnik, Szambelańczyk, 2006). Technical effectiveness is measured in a parametric and non-parametric manner.

Table 3 presents advantages and disadvantages of parametric methods.

Table 3: Comparison of advantages and disadvantages of parametric methods

Advantages	Disadvantages
Not necessarily large in size, the population of research objects makes it possible to conduct an analysis on the basis of which it is possible to formulate substantive conclusions	The need to make assumptions about the form of the production function and define the relationship between inputs and outputs
	Difficulty of observing "all" possible combinations of inputs and outputs for the analyzed entity
	Difficulty in specifying the mathematical form of the production function and consequently its mathematically identified interpretation
	The necessity of averaging data when estimating its parameters, as a result of which the empirical values deviate from the values of estimated model
	The regression curve determined on the basis of model values is not a limit of effectiveness since it does not cover all observations

Source: authors

In the parametric approach, efficiency is calculated on the basis of the production function, which determines the relation between inputs and outputs with regard to technologically efficient production processes. The parameters of this function are determined using classic econometric estimation tools. The parameters of the production function are estimated or calibrated based on statistical observations. The values of the production function are determined on the basis of a normative efficiency model, and deviations from them result from random errors or inefficiency of the examined entity (Panek, 2002). In parametric methods, the measure of effectiveness can be the rest of the model or the quotient of the empirical value of the result and its value obtained from the model.

In part, the disadvantages of parametric methods can be compensated for by using the so-called shifted model, in which the regression curve is shifted in such a way that the model "limits from above" all empirical observations. This is possible by translating the free expression value and leaving the slope of the regression curve unchanged. In this group of parametric methods, SFA (Stochastic Frontier Approach), TFA (Thick Frontier Approach) and DFA (Distribution Free Approach) are distinguished (Baran, Pietrzak, 2007; Becker, 2007; Becker, Becker, 2009; Borkowski, Ćwiąkała-Małys, 2004; Kosmaczewska, 2011; Nowak, 2009).

In a non-parametric approach, efficiency is calculated as the ratio of actual productivity to the highest possible productivity (Helta, 2009). Functional parameters are determined on the basis of models that do not require a functional relationship between inputs and outputs. Using mathematical programming methods and empirical observations the shape of the efficiency limit is determined. The value of the efficiency measure is determined on the basis of the

position of the examined entity relative to the efficiency limit. The basic methods of non-parametric approach include DEA (Data Envelopment Analysis) and FDH (Charnes, Cooper, Rhodes, 1978).

Table 4 presents advantages and disadvantages of non-parametric methods.

Table 4: Comparison of advantages and disadvantages of non-parametric methods

Advantages	Disadvantages
The design of the model is not fixed *a priori*, but adapted to the data, making it more flexible compared to parametric models	The need for knowledge of linear programming procedures
Lack of knowledge and skills required by previous methods to divide input (inputs) and output (outputs) variables properly[2]	Achieving a similar level of materiality as in the parametric models requires more objects in the sample
No need to formulate the functional relationship between inputs and outputs beforehand	The results are less, or not at all, independent of population distribution and outlier observations
Multi-criteria evaluation, i.e. the impact of multiple input variables on multiple output variables	
Non-parametric methods are insensitive to outliers, which is why they are so-called robust methods.	
The interpretation of the results does not require the adjustment of parameters to any distribution, thus eliminating methodological and interpretation difficulties	
No need to take into account a random factor in determining the effectiveness of the entity and the impact of potential measurement errors	

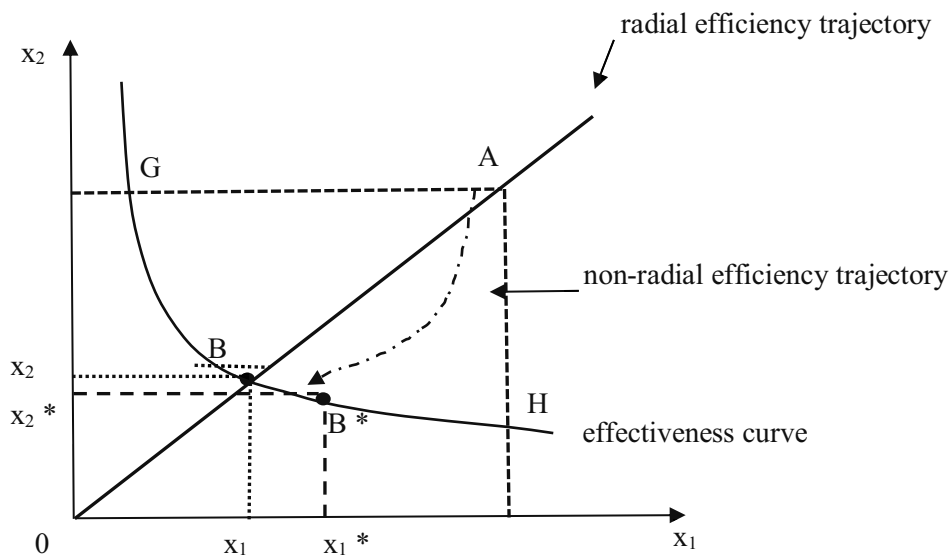
Source: authors

In the world, as evidenced by a rich bibliography, non-parametric methods, especially the DEA method, are well-known and frequently used for measuring efficiency. In Poland the DEA method was used to analyze the effectiveness of financial and public institutions. In the current conditions of strong competition, the increase in effectiveness of slaughter, production, meat and meat products is a challenge for all entities of the meat sector. Hence, the use of the DEA method and its variants is justified for the measurement and evaluation of the effectiveness of this sphere of economic life.

Figure 1 shows an illustration of the Russel efficiency measure.

---

[2] In non-parametric models, it is possible to check which of the variables are input and which are output, such that if the input variable does not lead to an increase in efficiency, it is the output variable.

Figure 1: Illustration of the Russel efficiency measure


Source: authors on: (Guzik, 2009, 2009 a).

In the article NR-DEA non-radial efficiency model based on Russel's degree of efficiency is used. CCR and SE-CCR models refer to the concept of efficiency formulated by Farrell - Debreu, in which the determination of technology efficiency in the sense of Farrell - Debreu consists in determining the coefficient allowing for maximum and proportional reduction of inputs or increase of results along the technological radius to such a level where it is still possible to obtain certain results by the o-th object. Unfortunately, the disadvantage of the measure of efficiency in the sense of Farrell-Debreu is its radial, i.e. linear nature, from which the assumption of a proportional reduction of all inputs is derived. From an economic point of view, this is not a beneficial feature. In the research subject matter of this work, it is justified to assume that not all expenditures contribute to a certain result or set of results to the same extent. Therefore, the solution to this problem is to apply the non-radial efficiency model proposed by Thanassoulis and Dyson (1992) in the form of a non-radial efficiency model (DEA), which is a modification of the CCR model. In the NR-DEA non-radial model, sub-factors for individual inputs have been introduced, with sub-factors being radial. The non-radial efficiency in the sense of Russell for the o-th object is described by the coefficient. The NR-CCR model takes the following form:

$$1.\ \overline{\theta_o}a = \frac{1}{N} \sum_{n=1}^{N} \theta_{no} \to \min$$

With restrictions:

$$2.\ \sum_{j=1}^{J} y_{rj}\lambda_{oj} \geq y_{ro} \quad \text{for } r = 1, \dots, R$$
$$3.\ \sum_{j=1}^{J} x_{nj}\lambda_{oj} \leq \theta_{no}x_{no} \quad \text{for } n = 1, \dots, N$$
$$4.\ \theta_{no} \leq 1 \quad \text{for } n = 1, \dots, N$$
$$5.\ \lambda_{oj}, \theta_{on} \geq 0 \quad \text{for } j = 1, \dots, J, n = 1, \dots, N$$

Where:
θ_{no}^* - optimal multiplier of the n-th effort in the o-th facility.

This coefficient should be interpreted as an indicator of the efficiency of the o-th facility due to the nth effort. It indicates how much as a percentage, the n-th effort should be reduced. It indicates how much as a percentage, the nth effort should be reduced in this facility to make this facility effective due to the effort under consideration.

4. Results and discussion on technical efficiency of poultry meat enterprises measured by input-oriented NR-DEA model

Table 5 presents the ranking of the highest technical efficiency of ten poultry meat enterprises in Poland in the years 2012-2017. Due to the NR-DEA model (VRS) it was possible to indicate that not all inputs contribute to a certain result or set of results to the same extent. The ranking of the highest technical efficiency levels shows that in poultry meat enterprises, the highest technical efficiency equal to 100% (17.27) was observed in Drobkal sp. j., the second company was PPH Doldrob Karol and Jarosław Dolman and Andrzej Więckiewicz sp. j. 73.31% (12.66) and ZD Linodrób 40.65% (7.02).

Table 5: Ranking of the highest technical efficiency of poultry meat enterprises by using the NR-DEA model (VRS)

Lp.	Company name	Arithmetic average	Scope (min.-max.)	Standard deviation	Variation coefficient	Average DEA values in 2012-2015 [%]
			Poultry meat enterprises			
1.	Drobkal sp. j.	17.27	16.03-18.96	1.37	0.08	100.00
2.	PPH Doldrob K. i J. Dolman i A. Więckiewicz sp. j.	12.66	11.95-13.21	0.61	0.05	73.31
3.	ZD Linodrób	7.02	6.48-7.69	0.50	0.07	40.65
4.	Indyk Śląsk	6.23	6.09-6.40	0.13	0.02	36.07
5.	System Drob	5.89	5.47-6.60	0.49	0.08	34.11
6.	Marek Sala	5.82	5.69-5.91	0.09	0.02	33.70
7.	Doldrob Grażyna	5.81	0-13.11	6.82	1.17	33.64
8.	Iko Kompania Drobiarska	5.40	5.11-5.76	0.32	0.06	31.27
9.	ZD w Stasinie sp. z o.o.	5.32	4.79-5.75	0.43	0.08	30.80
10.	Ekpols	5.27	5.05-5.45	0.17	0.03	30.52

Source: authors

Figure 2: Average DEA values in poultry meat enterprises in Poland in the years 2012-2017
Source: authors

Table 6 presents the average technical efficiency ratios of VRS calculated for the poultry meat enterprises in Poland in the years 2012-2017.

Table 6: Relation of the relative values of the technical performance factors of meat establishments using the NR-DEA model (VRS)

Years	Relation of the relative values of the technical performance factors	
	All meat enterprises	Poultry meat enterprises
2012	0.916	0.889
2013	0.617	0.468
2014	0.698	0.887
2015	0.830	0.783
2016	0.781	0.863
2017	0.615	0.784

Source: authors

In the group of all meat enterprises, the VRS technical efficiency coefficient was at a varied level. The total value of the technical efficiency coefficient VRS decreased from 0.916 (2012) to 0.615 (2017). In 2012, the average total technical efficiency ratio was 0.916, which means that the entire population (n=695) could reduce the level of the surveyed outlays by 8.4%, while poultry meat enterprises could reduce this level by 11.1%. On the basis of the analysis, it can be concluded that in 2012, the highest level of technical effectiveness of VRS was achieved by all meat enterprises in comparison with the remaining years of the analysis.

In the group of poultry meat enterprises, the VRS technical efficiency coefficient was less heterogeneous than in the group of all meat enterprises. The total value of the technical efficiency coefficient VRS decreased from 0.889 (2012) to 0.468 (2013). In 2012, the average total technical efficiency ratio was 0.889, which means that the poultry meat enterprises (n=53) could reduce the level of the surveyed outlays by 11.1%. On the basis of the analysis, it can be concluded that in 2012 and 2014, the highest level of technical effectiveness of VRS by poultry meat enterprises in comparison with the remaining years of the analysis was achieved.

Table 7 presents the ranking of technical efficiency of meat enterprises by groups, number of enterprises, and share in population (%) together with the average DEA value. In 2012, there were 20 poultry enterprises whose average technical efficiency was higher than the average DEA value (4.61) for this group, which meant that 37.74% of all poultry meat enterprises were technically efficient.

Table 7: The ranking of technical efficiency of poultry meat enterprises by using NR-DEA model (VRS)

Years	Number of efficient poultry meat enterprises	Share of efficient poultry meat enterprises in population (%)	Arithmetic mean of DEA value of efficient poultry meat enterprises
2012	20	37.74	4.61
2013	19	35.85	4.66
2014	21	39.62	4.72
2015	10	18.87	3.87
2016	11	20.75	4.56
2017	10	18.87	3.84

Source: authors

The results presented in table 7 shows that the population of poultry meat enterprises had a very large variation in the average DEA values. Moreover, the average size of the VRS technical performance factors showed a downward trend. In 2014 the highest technical efficiency measured in the number of efficient enterprises (21) was observed, which meant almost 40% of the analyzed population. In 2015 and 2017, the lowest technical efficiency measured in the number of efficient enterprises (10) was observed, which meant only 18.87 of the analyzed population. The reason for that were due to the unfavorable external conditions, related to the

conflict in Ukraine and the embargo imposed by Russia on Polish agro-food products, influenced changes in the volume of meat trade in foreign trade. The imposition of the embargo has contributed to changes in the directions of trade. Although in 2014 the results of the exchange of agro-food products with Central and Eastern Europe and EU Member States were successful, the period of adaptation to the changing economic situation influenced changes in the average DEA values this year (Drożdż, 2014, p. 3; Ambroziak, 2015, p. 7).

The calculated technical efficiency coefficients made it possible to measure the size of production gaps for enterprises in the years 2012-2017 . At this stage of research, model (optimal) input levels were identified with actual inputs of factors in order to increase technical efficiency to the unity of the surveyed enterprises. Benchmarking carried out - comparison of a given factor's resource with its most effective use. Benchmarking has become a tool to improve the use of the factor on the basis of the most effective (model) use of the resource in all surveyed groups of enterprises. If the production gap size was 0.00 in the model value approach, it means that the real values reached the model (optimal) size and do not need to be adjusted.

Table 8 presents the analyses of production gaps (mismatch of analyzed inputs) calculated for all meat companies and poultry meat enterprises in the years 2012-2017. Both groups of enterprises were very different. In a case of all meat enterprises production gaps in total assets increased from Mln PLN 22.982 (2013) to Mln PLN 31.932 (2015), equity increased from Mln PLN 10.229 (2013) to Mln PLN 14.260 (2015), receivables increased from Mln PLN 6.482 (2013) to Mln PLN 8.802 (2017). There was a slight increase in inventories from Mln PLN 2.875 (2013) to Mln PLN 3.835 (2015), too. In case of poultry meat enterprises production gaps in total assets increased from Mln PLN 82.479 (2013) to Mln PLN 124.058 (2015), equity increased from Mln PLN 34.533 (2013) to Mln PLN 54.070 (2015), receivables increased from Mln PLN 23.662 (2014) to Mln PLN 32.879 (2015). There was a strong increase in inventories from Mln PLN 10.239 (2013) to Mln PLN 16.911 (2017). The highest level of differentiation of production gaps was observed in poultry meat enterprises in all input categories compared to other groups of meat companies. Poultry meat production in Poland in the years 2014-2017 increased by 30%. The state of surplus supply led to a decrease in prices of main products of meat enterprises and products of animal origin, including prices of poultry livestock on the domestic and EU market (Ambroziak, 2015, p. 7). Difficulties in estimating the level of the use of inputs have been aggravated by the appearance of avian influenza.

To sum up the analyses of the technical efficiency of the poultry meat companies, it can be concluded that:
- the implementation of the adopted research objective enabled the formulation of conclusions and recommendations for economic practice,
- one group of conclusions presents the analytical potential of the non-parametric method and its usefulness in research on the estimation of technical efficiency of agribusiness entities,
- another group of conclusions concerns the importance of the assessment of the technical efficiency of poultry meat enterprises in comparison to all meat enterprises,
- the technical efficiency of poultry meat enterprises has decreased during the analyzed period,
- the highest level of differentiation of production gaps was observed in poultry meat enterprises in all input categories compared to other groups of companies.

5. Conclusions

The analysis of domestic and foreign literature in the field of measuring the technical efficiency of agro-food processing enterprises lead to the conclusion that the concept of efficiency is diverse and multi-dimensional and can be classified in various ways. Methods commonly used for assessing overall efficiency are based on three approaches: relying on ratio, parameters and non-parameters.

The difficulties concerning the efficiency measurements have arisen from the characteristics and properties of the different approaches and methods of its assessment. According to the conducted research, it can be said that the research hypothesis has been positively verified. Additionally, poultry meat enterprises on the agro-food sector create specific forms of cooperation and integration which influence their business results. It has been proven that technical efficiency depends on the level of optimizing the use of the analyzed factors affecting the level of productivity achieved by the examined enterprises.

Therefore, the obtained results will be used in further analyzes of factors affecting the level of maximization use of inputs using existing and modified methods of the efficiency measurement.

An attempt to develop a new concept for measuring and assessing the efficiency of food processing entities may have an influence on actions, entities affected by those actions, and may lead to the redefinition of the state's role in the stabilization of domestic food processing sector. The results of the article can be considered as a new contribution to the development of science, as it intends to identify, clarify and assess the financial efficiency of chosen group of processing enterprises in agro-food sector. In addition, the results can be helpful in creating a strategy for companies, development institutions and creating economic policy programs in agriculture, helping adjust the activities of related entities in the agro-food market, as well as determine the role of the state in terms of stabilization of the domestic meat market and to gain the significant competitive advantages.

EXPLORING THE CONCEPT OF CIRCULAR ECONOMY AND ECO-INNOVATIONS IN THE CONTEXT OF THE REGIONAL DEVELOPMENT

ABSTRACT

The international community has reacted to unsustainable use of natural resources and raising environmental issues by establishing the policies for sustainable development of the society. One of the most important is Circular economy policy that involves integrative processes for all of three dimensions: economic, environmental and social. Interdisciplinary framework of Circular economy requires different approaches and systemic solutions, instruments and mechanisms driven by paradigm of sustainable consumption and production. The key element of Circular economy are Eco-innovations that bring along not only environmental innovative technology solutions but also involves holistic combinations of service innovations and novel organizational set-ups. Therefore, scientific and expert society foster experience sharing on Circular economy and eco-innovative solutions including the best practices to the global, national, and regional scale. Considering Eco-innovations as the key element in enabling regional transition to Circular economy, this paper explores their interactions and provides conceptual modes for establishing the eco-economic space of the region. In addition, this work exploring the monitoring framework and indicators in order to provide data for benchmarking the progress among different regions.

Key words: *circular economy, eco-innovations, regional development, eco-economic space of the region, monitoring framework, indicators.*

1. Introduction

In competitive globalized markets, consumers and producers alike may have strong interests in economic stability and growth, but also in avoiding humanity's burden on the environment. Socio-economic and environmental issues, such as waste or emissions of greenhouse gases (GHG) are strongly connected and therefore the sustainability transitions are essential to establish various forms of society's resilience. The systemic issues are the growing threats to ecosystem resilience and the complex challenges for society on every scale – global, national, and regional (EEA, 2019, 8). To transform economy and society in more sustainable one, the new modes of design, manufacturing and logistics of goods and services are available through Circular economy (CE) approach and Eco-innovations (EIs). This new paradigm ensures many opportunities for the regions to involve a new technological and non-technological environmentally friendly solution.

According to authors Shabunina et al (2017, 178), eco-economic space of the region is a system formed by interacting economic and environmental aspects aimed for better living conditions for the inhabitants. In this context, variety of environmental friendly CE and EIs methodological provisions with positive impacts on economy and society are established. For e.g. guidelines, incentives and subsidies for CE and EIs implementation, and variety of market mechanism associated with the innovative production and consumption processes are available (EC, 2015, 6, Shabunina et al, 2017, 179). The balance between eco-innovative supply chain and economy provides a high level of environmental safety, energy efficiency and sustainable consumption of resources. Therefore, regions become spatially, economically and socially conscious spaces where exploitation of environment and natural resources is engaged in a self-sustaining way.

The objectives of this paper is to discuss interlinkages between CE and EIs on the regional level. Secondly, this paper explores conceptual implementation of CE and EIs at eco-economic space of the region and provide examples of the best practices. Thirdly, this work provides comprehensive insight into potential benefits and obstacles that regions may encounter during the introduction of CE and EIs. At the end, according to presented evaluation framework, this paper introduces modes for monitoring the progress in implementation of CE and EIs at the regional level accompanied with relevant indicators aimed to ensure comparison among regions.

2. Literature review

In 2015, European Commission launched an ambitious policy for CE (EC, 2015, 2). In contrast to the "take-make-waste" linear economy model, CE ensures moving to the "closed-loop" paradigm. Concept of CE brings economic benefit, reduces environmental impact by relocating waste as a resource from the end of the supply chain to the beginning, and eliminates toxic substances from processes and by using resources more efficiently (Figure 1).

Figure 1: A simplified illustration of Circular economy
Source: UNIDO, 2017, 1

Extending product lifespan is achieved through improved eco-design and servicing, so the products are more durable and can be reused, remanufactured, recycled back into a raw material or as a last resort, disposed of (UNIDO, 2017, 1). Therefore, interdisciplinary framework of CE requires different approaches and solutions, including EIs to assure transformative achievements towards techno-economic and social sustainable transition. It is important to

stress that information and communication technologies (ICTs) play a key role in enabling implementation of CE and EIs to existing business models (WEF, 2014, 25).

Circular Economy Action Plan (EC, 2015, 18) defines EIs as a tool for advancement of production and consumption, including repair, remanufacturing and waste management. Specifically, EIs are any innovations that reduce the use of natural resources and decrease the release of harmful substances across the whole lifecycle of product or service (EC, 2011a, 2, EC, 2019a, 20). Within the CE approach, EIs has a key role in many areas such as energy, water and waste, including material use and products (Figure 2).

Figure 2: Environmental objectives of EIs
Source: authors

EIs could be technological and non-technological. Eco-innovative equipment of the processes is in the focus of technological EIs (Cecere et al, 2014, 1039). Areas where non-technological EIs could be manifested are social and organizational (Rennings, 2000, 322). Enhancing eco-effectiveness in consumption and production, EIs bring a competitive advantage across many businesses sectors.

3. Theoretical framework for introduction of CE and EIs at eco-economic space of the regions

As previously mentioned, CE accompanied with EIs supports new growth opportunities for the positive transformation. Literature data reveals estimation that by 2030 a shift towards a CE could reduce net resource spending in the EU by €600 billion annually, bringing total benefits estimated at €1.8 trillion per year (EMF and GD, 2015, 11). In 2014 European Commission (EC, 2014, 5) estimated that a shift to a CE would deliver a 0.8% GDP increase by 2030. Besides these rough economy predictions, it will be appropriate to consider introduction of CE and EIs concerning resources and market conditions, regulation instruments and managerial methods (Shabunina et al, 2017, 178).

In relation to broader national frameworks, regions could be more flexible to explore modes of closed material cycles and competitive EIs (EMF, 2013, 19). The smaller spatial units are less dependent from globalized financial and economic trends and, in general, have less environmental impact than large-scale global solutions (Korhonen et al, 2018, 544). Additionally, balance between economy and ecosystems can contribute to the self-

sustainability of regions, especially in times of crisis. Furthermore, economically advanced regions are strongly obligated to reduce environmental impacts. However, the less developed regions should also meet all environmental obligations to establish sustainable lifestyles, technologies and infrastructures. Therefore, there are variety of demands on operating companies. Industry modernization and growing need for energy and resources, sorting and recycling technologies including waste-water treatment infrastructure force companies to become environmentally active (Van Berkel et al, 2009, 1544). Besides those internal factors, companies should take into account external influence like environmental regulation and policies. Companies are mainly motivated by environmental policy or specific issues such as waste management (Mattila et al, 2010, 4309), but recently they became a fertile ground for enhanced wider environmental performance through EIs and Environmental Management Systems (EMSs) such as ISO 14001, Eco-management Audit Scheme (EMAS). Besides, emerging collaborative patterns of the join business and environmental conceptual solutions are available in variety of spatially extent (Figure 3).

Figure 3: Concepts related to the spatial dimension of EIs

Source: Massard et al, 2014, 12

Good examples of spatial collaborative approach that enhance performance of the eco-economic space of the regions are Eco-industrial park and Eco-innovation park (EI parks). Eco-industrial park is the community of manufacturing and service businesses that has a commitment to enhanced economic and environmental performance through collaboration in managing environmental and resource issues including energy, water, and materials (Massard et al, 2014, 12). By working together, the community seeks a synergy where collective benefit is greater than the sum of the individual benefits, so each company realizes it only by optimization of its individual performance (Erkman, 2001, 531). Tools for company-level optimization are, for e.g. the Green supply chain management concept (GSC, 2017, 4) or EMSs. The main goal of these practices is to "minimize use of resources and waste including hazardous chemicals, and to reduce emissions, energy consumption and impact on biodiversity" (Chin et al, 2015, 696). Collaboration between Eco-industrial parks develop spontaneously through independent business partnerships, also known as Eco-industrial networks (Ruth and Davidsdottir, 2009, 3).

The term Eco-innovation parks (EI park) is used to define both Eco-industrial parks and Eco-innovative areas combining residential and industrial communities, such as Eco-cities and Eco-towns (Massard et al, 2014, 13). Besides optimization of environmental performance (e.g. processes that incorporate environmental technologies and services), EI parks are open for improvement through cooperation with broad stakeholders such as public institutions and those dedicated to research and development (R&D) (Massard et al, 2014, 20). Therefore, EI park is industrial regional symbioses where CE and EIs are applicable. Considering global competitiveness, this kind of industrial community is incubator of green and clean technologies, processes, products and services (Massard et al, 2014, 45). They provide tangible benefits in terms of investments, turnover, and market including a job creation.

More precisely, the synergy of CE and EIs implemented in EI park offered: (i) new modes of application and distribution of existing products, (ii) an integration of new production processes, products or services, and (iii) innovative models for marketing to foster company competitiveness and to alter change of existing patterns of consumer's behaviour (EC, 2011b, 6). Considered this practice in the context of society, it is obvious that systemic change of eco-economy space of the region is necessary. This approach implies conducting previously mentioned analysis for restructuring of market, instruments and management methods and drafting the innovative development regional strategy.

Companies reinvent processes and infrastructures with the new CE business models, primary to increase market competitiveness (Koellner et al, 2007, 41). In order to provide basis for this comprehensive analysis of all potential benefits, the examples of CE good practices by type of EIs are introduced in Table 1. Modelling of the best management practices could increase integration of numerous different perspectives and domains between existing and new business models. This approach brings a systemic visioning of economic development based on decoupling of economic growth from the consumption of finite resources and environmental issues. In addition, it is crucial to take into account regional specificities and potential negative effects of CE and EIs implementation.

Table 1: Selected examples of CE practices by type of EIs

Type of EIs	Examples of CE solutions
Product design EIs	On the stage of eco-design of products and services, the emphasis is on eco-efficient use of materials and processes Overall impact on the environment and material input is minimized over the whole product's life cycle Allowing for recovery options like repairing, maintenance, remanufacturing, recycling and cascading use of components and materials, including organic waste
Process EIs	Material use, emissions and hazardous substances are reduced, risks are lowered and costs are saved in production processes Remanufacturing such as refurbishment by replacing or repairing components that are defective, including the update of products Disassembly and recovery of components, materials and substances Upcycling, functional recycling, down-cycling Zero waste production, zero emissions, cleaner production
Organizational EIs	Methods and management systems reorganization pushing for closing the loops and increasing resource efficiency New business models e.g. industrial symbiosis, new collection and recovery schemes for valuable resources From products to functional services (product-service systems)
Marketing EIs	Product and service design, placement, promotion, pricing Promotion of the reuse for the same purpose (e.g. bottles, appliances), promotion of the reuse for different purposes (e.g. tires as boat fenders, for play grounds) Eco-labelling, green branding, Environmental Management Systems (EMSs)
Social EIs	Behavioral and lifestyle changes, user-led innovation Sharing (e.g. domestic appliances, books, textiles), collaborative consumption (e.g. flats, garden tools) sufficiency (e.g. plastic bag bans) Smart consumption, responsible shopping, use rather than own schemes
System EIs	Entirely new systems are created with completely new functions reducing the overall environmental impact Leading to a substantial dematerialization of the industrial society New urban governance, smart cities, permaculture

Source: EC, 2016, 13

4. Potential benefits and obstacles of CE and EIs on the regional scale

According to European Environment Agency (EEA, 2016a, 15) the advantage of CE and EIs established on the regional level are in physical proximity of a spatially smaller environment, as well as in facilitated business among cooperating companies and strong encouragement from local stakeholders. In a case of a link between the region and eco-cities that strive for sustainability transition the benefits are occurred in local sourcing of required materials and zero-waste strategies, in a high share of renewable energy or low carbon solutions in public transport system, as well as in support for local and regional agriculture (Vence and Pereira 2019, 1). However, Eco-innovation Observatory proposed the various examples where the economic and social systems on every spatial scale boost the transition to CE and EIs (EC, 2018a, 10). Nevertheless, many other institutions and authors explore potential benefits and opportunities of CE-based regional development, and some of them are introduced in Table 2.

Table 2: Potential benefits and opportunities of CE-based regional development

Area of CE regional development	CE-related potential benefits and opportunities for regions	Authors identifying the benefits
Economic	• CE business models and reformed production processes • new CE products and services • resource efficiency, energy efficiency increase and energy savings in businesses against scarcity of resources • reduced reliance on raw materials import • green-based economic growth • R&D stimulated by CE solutions • CE-oriented fiscal policy	EMF, 2013, 22; EMF and GD, 2015, 5; EEA, 2016b, 41; Prieto-Sandoval, 2018, 605; EC, 2018a, 10; Demirel and Danisman, 2019, 1611
Environmental	• CE solutions in waste management- reusing materials and goods, refurbishment, remanufacturing, recycling, reduce landfilling • increase in material consumption effectiveness • increase of renewable energy production and consumption • increase in water reuse • decrease in air, water and land pollution, and GHG emissions • biodiversity support	EMF, 2013, 22; Chin et al 2015, 698; Lazarevic and Valve, 2017, 60; De Jesus et al 2018, 3012; Sgroi et al 2018, 22; Pomponi, F., Moncaster, 2017, 712
Social	• increase social awareness about environment • circular thinking society development • opportunities for local jobs and social integration • CE social innovation stimulation • CE consumption patterns (e.g. sharing economy) • CE social entrepreneurship development • new model of collaboration among stakeholders	EMF 2013, 22, 10; EMF and GD, 2015, 5; EEA 2016b, 41; Kalmykova et al, 2018, 193; EC, 2018a, 10; Moreau et al, 2017, 497
Spatial	• CE-based approach in spatial management • development of CE zones (industrial and urban symbiosis of regional systems) • CE transport and mobility infrastructure solutions (sharing services, development of public transport) • CE public spaces (CE regional policy providing more opportunities to create public spaces that	McDowall et al 2017, 651; EEA, 2016b, 41; Leising et al, 2018, 979; Ghisellinia et al, 2018, 623; Zawieska, J. and Pieriegud, 2018, 39
Cultural	• CE-based forms of art • CE-based urban design	Homrich et al, 2018, 529; De los Rios and Charnley, 2017, 113; Fusco Girard and Gravagnuolo, 2017, 39

Source: authors

In the last two decades, industrial sectors underpin economic development through environmental performance and resource efficiency practice (Massard et al, 2014, 12). Cities and regions have a key role to play as promoters, facilitators and enablers of CE (OECD, 2019, 4). Their provision of infrastructure and involvement of local suppliers ensures added value in their position to the regional and also global supply chain. In addition, the application of CE and EIs is significant in production of chemicals and fertilizers, agro-food innovation, in the field of sustainable transport development and the public procurement (EC, 2019a, 20). It should be emphasized that Small and Medium-Sized Enterprises (SMEs) are at the core of the

sustainability transitions that allows the recovery of valuable materials and water, or enhance energy efficiency or land take (Demirel and Danisman, 2019, 1615).

On the other hand, disruptive changes and radical innovations accompanied with possible negative implication like financial, structural, operational, attitudinal and technological barriers od CE and EIs has been occurred recently (Ritzéna and Sandström, 2017, 9). Due to the survey conducting by OECD (2019, 6), the main obstacles to CE transition are related to cultural barriers, incoherent regulatory framework, financial resources, critical scale and holistic vision, including lack of adequate information, human resources and political will. According to Shabunina et al (2017, 179), economic obstacles could be market prices (which do not fully reflect manufacturing cost of product or service), lack of tools to assess profitability of investments in CE and EIs and complexity of transition from traditional technologies to eco-technologies. Technological obstacles are represented through mismatch of technology with the specified economic requirements, lack of alternative materials that can replace hazardous components and complexity of eco-innovation technologies (Vignali et al, 2020, 220). Furthermore, management obstacles refer to lack of experience in the management of such changes, and most usually, personnel obstacles are lack of highly qualified personnel in eco-innovation management, monitoring, and implementation as well as reluctance of companies to invest in staff training (Johnson, 2010, 91). Consumer behaviour obstacles refer to stability of perception of CE and EIs and the risk of customers' loss due to the price increase caused by the cost of eco-technologies in the final price of the product (Newton and Cantarello, 2014, 58). According to the Murray et al (2017, 369), some sustainable activities have negative impact on the environment. For instance, production of green fuels and some energy technologies are based on long-lasting materials or materials that are not recyclable at all. Therefore, their application may have negative environmental consequences. Also, CE and EIs implementation includes potential challenges such as financial constrains related to considerable costs for R&D, asset investments, subsidy payments for new business models, and public investment (e.g. in waste management and ICT infrastructure). The cost of this transition considered as one of the major barriers, particular for the SMEs. Therefore, the appropriate finance tools for all sizes and types of companies and organizations should be radical enhanced. Most of previously mentioned obstacles could be avoided by careful planning of eco-economic space of the region.

5. Monitoring framework for evaluation of eco-economic space of the region

Companies see opportunity in following the CE model and implementation of EIs in their business and investment choices. Therefore, evaluation and tracking the progress are necessary to support the maintenance of the outlined orientation and decision-making. Many authors (Lou et al, 2015, 514; Heshmati, 2015, 16; Smol et al, 2017, 669; Avdiushchenko, 2018, 4398) emphasize the importance of uniform metrics for measuring transition from linear to CE, including implementation of EIs. According to European Environment Agency (EEA, 2014, 7), environmental indicators are essential tools for assessing environmental trends, tracking progress against objectives and targets, evaluating the effectiveness of policies and communicating complex phenomena. Evaluation indicators can be determined with regard to technical, environmental, economic, social, or other objectives taking into account the specific conditions (Kulczycka and Lelek, 2014, 16; Liu and Bai, 2014, 147). Thus, European Commission defined the framework for CE monitoring (EC, 2018a, 7) and emphasis the need to move away from being overly focused on waste management. The areas such as eco-design, collaborative economy and social dimension are included, as well as data of environmental emissions.

To indicate applicable monitoring framework for eco-economy space of the region, variety sets of indicators are considered in this work: Eco-Innovation Scoreboard (EC, 2018b, 2), Regional

Innovation Scoreboard indicators (EC, 2019a, 20), Eurostat's targets and indicators (Eurostat, 2019), Material flow indicators (MFA, 2019), and Eco-efficiency indicators (UN, 2009). At the end, the list of circularity indicators proposed by Ellen MacArthur Foundation (EMF and GD, 2015, 5) and circular transition indicators provided by World Business Council for Sustainable Development (WBCSD, 2020, 10) are also consulted, so complementary framework with measurable set of indicators for five focus areas is proposed in Table 3.

Table 3: Monitoring framework for evaluation of CE and EIs performance at regional level

Monitoring area	Indicators	Sources
Technological	Total material requirement per capita Share of water circularity Number of CE business models Number of technological EIs Number of ICT solutions in CE business models	MFN, 2018; EC, 2018c, 4; WBCSD 2019, 10; OECD, 2019, 6; Eurostat, 2019
Economic	Share of CE inflow and outflow (total) Share of SME's with CE business models Share of private investments in CE Resource productivity Number of patents related to waste management and recycling per total number of patents	OECD, 2008, 76; COM, 2018b, 2; WBCSD, 2019, 10; Eurostat, 2019; EC, 2019b, 7

6. Conclusion and recommendations

Ecological innovative investments, new jobs, and consequently sustainable patterns of behaviour in both production and consumption areas are driven by economy, natural resources and environmental concerns. As mentioned previously, implementation of CE and EIs aims to maintain the value of products, materials and resources for as long as possible by returning them into the product cycle. Especially in the challenging systems such as food, energy and mobility, CE and EIs play a key role in improving environmental performance and increasing resilience of society.

Taking into account presented research, circular and more innovative economy seems to be as more manageable at the regional scale. In comparison to spatially larger environment, regions are less dependent from globalized financial and economic trends. Additionally, introduction

of environmental friendly solutions at eco-economic space of the region is a way that region could reduce environmental pollution and use natural resources more efficiently. Generally, by applying CE principle and EIs at the regional level, the pressures on the natural capital and environment should not be alleviated, but some of disruptive changes could occur. The financial obstacles of CE and EIs implementation are considered as one of the major barriers, particular for SMEs, so appropriate finance tools for all sizes and types of corporations should be radical enhanced. Besides, economic, technological, management, personnel and consumer's obstacles should be considered within a regional characteristics and specifics. In order to highlight importance of comprehensive analysis needed for restructuring of eco-economy space of the region, examples of a good practice and appropriate instruments and methods are presented in this paper. As a final product of such comprehensive analysis could be the innovative development strategy for implementation of CE and EIs aimed for sustainable management of the region.

In this paper, another important consideration was to evaluate the CE and EIs benefits and to reflect the sustainability challenges of eco-economy space of the region. In order to evaluate progress in transparent and uniform manner, we propose monitoring framework with set of identified indicators to assess circularity of the product, project and company, and to evaluate EIs performance at the regional level.

Good practice, potential obstacles and proposed monitoring framework could be valuable tools for regional decision-makers to achieve CE goals and EIs outcomes and increase competitiveness. In the last decade, it is obvious that the advantage in the market depends on following the global economy and social sustainable trends, reduced environmental pressures, and security of supply of materials. In addition, the introduction of CE and EIs across many economic sectors creates new jobs and strengthening social security at the regional level, especially in the time of crisis.

INSIGHTS INTO VOLUNTARY DISCLOSURE OF CASH FLOWS INFORMATION IN CROATIA

ABSTRACT

Since the mandatory application of International Accounting Standard 7 - Cash Flow Statements for the companies that prepare financial statements in conformity with IFRSs in 1994, the statement of cash flows became a very important source of accounting information. However, the presentation of this statement as an integral part of primary financial statements in Croatia is still primarily in the function of legal requirements satisfaction. The study focuses on the voluntary disclosure of cash flows information in the annual reports of Croatian companies whose shares are listed on the Zagreb Stock Exchange. The research is conducted on a sample of 114 companies with the aim to identify characteristics of companies that provide extensive disclosures on cash flows. Logistic regression method is used to explain the relationship between dependent binary variable of voluntary cash flow information disclosure and two groups of independent variables: accounting data (e.g. size, income, operating cash flow, payment of dividends, method used for operating cash flow reporting) and capital market information (e.g. segment of market listed, news announcement and stock market listing duration). Findings indicate that company size as well as stock market listing duration (in years) significantly and positively affect the voluntary disclosure of cash flow information in the annual report of Croatian companies. All remain variables tested are not found to be statistically significantly related to the cash flows information voluntary disclosure level. It can be concluded that despite the desire of the regulatory authorities that capital market investors receive all relevant information, voluntarily cash flow disclosure is not apparent in Croatia and companies voluntarily disclose additional information about cash flows very rarely.

Key words: *voluntary disclosure, cash flows, Croatia.*

1. Introduction

Since the mandatory application of International Accounting Standard 7 - Cash Flow Statements for the companies that prepare financial statements in conformity with IFRSs in 1994, the statement of cash flows became a very important source of accounting information.

However, the presentation of this statement as an integral part of primary financial statements in Croatia is still primarily in the function of legal requirements satisfaction.

According to the Law on Accounting (Official Gazette of the Republic of Croatia, No. 78, 2015) and Changes and Amendments to the Law on Accounting (Official Gazette of the Republic of Croatia, No. 134, 2015; No. 120, 2016; No. 116, 2018), all entrepreneurs (article 17) except of large entrepreneurs and public interest entities - PIEs are obliged to draw up and present annual financial statements by application of the Croatian Financial Reporting Standards (CFRSs). The same article prescribes that large entrepreneurs and PIEs are required to draw up and present their annual financial statements by application of the International Financial Reporting Standards, (IFRSs). Both CFRSs and IFRSs/IASs, as well as article 19 of Law on Accounting, define a complete set of financial statements that should include a balance sheet, a profit and loss account, a cash flows statement, a statement on changes in equity, and notes to the financial statements. However, as article 19.3 states that micro and small entrepreneurs shall prepare the balance sheet, the profit and loss account and the notes to the financial statements only, in this paper particularly listed companies which prepare and present their annual financial statements by application of the IFRSs/IASs are examined. The study focuses on the voluntary disclosure of cash flows information (e.g. notes to Statement, cash-flow ratios, liquidity analysis, cash flow trend analysis, etc.) in the annual reports of Croatian companies whose shares are listed on the Zagreb Stock Exchange.

The remainder of the paper is organized as follows: in Section 2 the most relevant previous papers on cash flows voluntary reporting are systematized and critically analysed. In section 3, the sample selection and variable description are presented. The features of extensive cash flow disclosure in Croatia have been quantified and the impact of various characteristics of companies on it has been empirically verified in section 4. The paper ends with concluding remarks.

2. Literature review

Financial reporting practices on the statement of cash flows have been the subject of many pieces of research. Some of them were investigating regulation aspects of the Statement, while others were interested in determinants of the companies that voluntarily disclose cash flow information.

There is research that provides insights into cash flow reporting practices in different countries, i.e. in a different institutional environment. For example, Gebhardt and Scholz (2014) conduct an analysis of the costs and benefits of requiring an additional presentation of the statement of cash flows using the direct method in German companies. They concluded that critics arguing that direct method is too costly, less reliable and impede the timely release of filings are not in compliance with practitioners' opinion, the same as the argument that the direct method would not provide useful information. Based on the 2013 and 2014 consolidated statements of cash flows of companies listed in Euronext Lisbon, Pexinho (2016) analysed the cash flow disclosures and found evidence of uniformity and consistency in the use of the direct method for reporting operational activities. Kundeliene and Stepanauskaite (2018) investigated the extent of voluntary information disclosure on the websites of Lithuanian companies. Their results showed a statistically significant correlation between the company's size and profitability with a wider scope and a larger volume of information.

Recently, comparative studies on a group of countries become very popular. For example, Berglof and Pajuste (2005) have examined the level of disclosures in 10 Central and Eastern European (CEE) countries (not including Croatia) and found widespread non-disclosure of even the most basic elements of corporate governance despite existing regulation. Furthermore, they found high discrepancies in the level of disclosure among firms, and especially among countries. Taran et al. (2017) have explored the relationship between foreign ownership and financial disclosure practices of listed companies of 16 countries from the CEE region. Unlike similar research, they did not control the results for the country effect but conduct an analysis for the region as a whole. This approach may bias the obtained results because of differences in the accounting regulatory framework and EU membership status, as well as differences in historical and cultural background, banking-financing orientation, the prevalence of statutory-control, etc. This claim is corroborated with evidence from Pivac, Vuko and Cular (2017) research who analysed and compare the level of annual report disclosure quality for listed companies in 5 European transition countries and found significant differences in disclosure quality of annual reports between the observed countries. As a possible reason, they state the overall business environment, the difference in EU membership status and socio-political characteristics.

Also, previous research on voluntary disclosure of cash flows information in Croatia should be mentioned. Aljinović Barać (2012) conduct a research on extensive disclosures practices of Croatian large companies whose shares are listed on the Zagreb Stock Exchange and found that companies which voluntarily disclose information about cash flows are young (i.e. their shares are listed on an organized securities market for a short time) and profitable with growing net income and growing cash flow from operating activities and usually use indirect method for operating cash flow report. Aljinović Barać, Granić and Vuko (2014) extended their research on medium and large companies, as well as on companies whose shares are not listed on the organized capital market. Thus, their findings differ with regard to Aljinović Barać (2012) results, and show that firm size, listing status and the industrial sector significantly and positively affect the level and extent of voluntary disclosure in the annual report of Croatian companies. On the other hand, Gulin and Hladika (2017) reduced their research on the benefits and advantages of information presented in the statement of cash flows to a subsample of 35 Croatian large companies whose shares are listed on the Zagreb Stock Exchange. Obtained results show that possibilities and perspectives of the company's development, undertaking the investment ventures, business combinations, and other integrations are increasing as a result of transparent reporting on cash flows and that investors and creditors have greater confidence in companies that generate positive cash flows.

3. Materials and methods

This research includes all Croatian companies listed on the Zagreb Stock Exchange (ZSE) regulated market in the year 2016, as listed companies have to comply financial reporting with the IASB standards and need to draw up and present cash flow statement and notes to financial statements. Banks, investment funds and other financial institutions are excluded from the sample because of asset structure differences. In addition, 3 companies with missing or incomplete financial statements data are also excluded, which is presented in Table 1.

Table 1: Sample selection

Number of shares listed on ZSE market	*147*
Number of multiple shares issuers	*(5)*
Banks, investment funds and other financial institutions (NCEA sector K – Financial and insurance activities)	*(21)*
Missing data	*(7)*
Final sample subset	***114***

Source: estimated according to data from authors' database (2018)

Data set necessary for analysis is extracted from hand-collected annual reports of listed companies on Croatian capital market, available on www.zse.hr.

3.1. Variables description and hypotheses development

Analysis of scientific literature done by Kundeliene and Stepanauskaite (2018) showed that there is no common theory that is adjusted to voluntary information disclosure analysis, but mostly used theoretical background for voluntary information disclosure literature include agency theory, signalling theory, and capital cost theory. Consistent with prior research, several factors that could affect the company's decision to publicly announce information about cash flows are considered. Those variables can be divided into two groups: accounting data (e.g. income, operating cash flow, payment of dividends, a method used for operating cash flow reporting, and size), and capital market information (e.g. segment of market listed, news announcements, and age).

Dependent variable cash flow disclosure (CFD) is an indicator variable set equal to one if the company announce any voluntary information about cash flow in notes to financial statements (e.g. financial ratios, additional data about items in statement of cash flows, management analysis of cash flow/liquidity, trend analysis, etc.) and zero otherwise. Detail description of dependent variables and expected association with voluntary cash flow information disclosure is presented in the table below.

Table 2: Variables description

Variable	Symbol	Metrics	Exp. sign
ACCOUNTING DATA			
Change in operating cash flow	ΔCFO	$\dfrac{\text{Operating cash flow}_{i,t} - \text{Operating cash flow}_{i,t-1}}{\text{Total assets}_{i,t-1}}$	+
Operating cash flow reporting method	MTHD	0 – direct 1 – indirect	+/-
Dividend payout	DIV	0 – no 1 – yes	+
Change in net income	ΔNI	$\dfrac{\text{Net income}_{i,t} - \text{Net income}_{i,t-1}}{\text{Total assets}_{i,t-1}}$	+/-
Size of the company	SIZE	$\text{Ln} \left(\dfrac{\text{Total assets}_{i,t} - \text{Total assets}_{i,t-1}}{2} \right)$	+
MARKET DATA			
Stock market segment	MKT	0 – regular market 1 – official market	+
News announcement	NEWS	0 – no 1 – yes	+
Issuer on the ZSE	AGE	Number of years listed	+/-

Source: Authors (2019)

A variable change in operating cash flow (ΔCFO) is used to measure cash flow performance. According to IAS 7.14, operating activities are the main revenue-producing activities of the company, so operating cash flows include cash received from customers and cash paid to suppliers and employees. The expected association of this variable to voluntary cash flow disclosure is positive, indicating that companies that generate more cash flow from operating activities will probably announce it voluntarily with the aim to differentiate themselves from less liquid ones and to attract business partners.

According to Gray et al. (2001:122), variations in the format of the financial statements (MTHD) influence financial reporting and information disclosure practices. Although IAS 7 [IAS 7.18] encourages the direct method of presentation, very few financial statement preparers adhere to the guidance so the indirect method continues to be the most favoured. On the other hand, interested parties have indicated that the cost of switching from indirect to direct method is not worth any incremental benefit over the indirect method that might exist. Because rule makers have consistently favoured mandating the direct method, it is likely that the Statement will undergo a transformation in the future (Jeppson et al, 2016). Furthermore, Gebhardt and Scholz (2014) findings on the practices of German and Australian companies show that concerns that direct method is too costly, less reliable and impedes the timely release of fillings are not well-founded. Moreover, they also find a direct method more useful for internal users. It is interesting to note that in Portugal most of the listed companies (more than 90%) chose the direct method to present the operating cash flow, but the reason is that the direct method is the only method authorized by the Portuguese regulation (NCRF 2) (Peixinho, 2016). However, as companies and regulators have been debating for years which method of operating cash flows presentation is better, expected sign of association with voluntary cash flow disclosure cannot be determined.

A variable dividend payout (DIV) is set equal to one if the company paid out dividend in the current year and zero otherwise. The expected association of this variable to voluntary cash flow disclosure is positive, indicating that companies that decide to pay out dividends will probably voluntarily announce plenty of cash flow information to point out their liquidity and to attract new investors.

A variable change in net income (ΔNI) is used to measure the company's profitability. The expected association of this variable with cash flow reporting practice cannot be uniquely determined. Namely, the companies may have an incentive to publicly announce cash flow information in order to declare free of blame for bad financial performance. Results of Wasley and Wu (2006) study suggest that management discloses cash flow information to mitigate the negative impact of bad news in earnings. Thus, the probability of cash flow voluntary disclosure decreases with better financial performance results measured by net income. On the other hand, according to Guay et al. (2016), more profitable companies are expected to have incentives to voluntarily disclose more information, if it is on their benefit. Moreover, Taran et al. (2017) point as they are profitable they may easily afford disclosure costs.

According to Taran et al. (2017), variable size (SIZE) captures the sensitiveness of companies to information costs and it is expected that larger firms will have a higher level of disclosure because they have activities that are more complex. Consequently, they have more stakeholder groups whose demands must be satisfied, and these companies are more noticeable. Due to this fact, they provide more information in order to improve reputation and meet the regulatory requirements (Kundeliene and Stepanauskaite 2018). Furthermore,

according to Juhmani (2014), larger companies are more noticeable by society, so in order to maintain their reputation, they are likely to disclose more information.

According to Meek and Gray (1989) listing at a different market (MKT) segment is likely to result in additional demand for voluntary disclosures. There are two main market parts in ZSE: regulated market and multilateral trading facility and the main difference between these markets is in the level of transparency, as multilateral trading facility has low requirements set on the issuer with regard to publicly available information. Thus, only companies traded at the regulated market are included in the sample. Regulated market is divided into three segments: Prime market**,** Official market, and Regular market. Prime Market is the most demanding market segment in relation to transparency. Regular Market commits the issuer to submit only a minimum of information stipulated by the Capital Market Act while the Exchange Rules stipulate additional requirements applicable to the Official Market. However, only two types of market segments are identified in the sample: Official (n=24) and Regular (n=90), so this variable covariate categorical in the binary logistic regression model. The expected association of this variable with cash flow reporting practice is positive, indicating that the probability of cash flow voluntary disclosure increases with the listing at the official market segment.

A variable news announcements (NEWS) is set equal to one if the company announces news at the capital market in the current year and zero otherwise. As in 85 cases (75%), no news is announced in the current year, this variable is set as a dummy in the model. The expected association of this variable to voluntary cash flow disclosure is positive, indicating that the probability of cash flow voluntary disclosure increases with news announcements.

A variable age (AGE) is measured as the number of years of listing share on ZSE. According to Wasley and Wu (2006) there is greater uncertainty about "young" companies' earnings and their product activity, so their management will disclose more cash flow information in order to signal economic viability. On the other hand, Juhmani (2014) claims that an "older" company, i.e. which operates longer and lists its shares on the stock market for a longer time, will need more communication to the outside community to maintain a good public image. As a result, the expected association of this variable with cash flow reporting practice cannot be uniquely determined.

4. Research results and discussion

4.1. Univariate statistics

Descriptive statistics highlight the differences in average, minimum and maximum values of numeric variables between disclosing and non-disclosing cash flow information groups.

Table 3: Between groups descriptive statistics

Variable	CFD	N	Mean	Minimum	Maximum	Std. Deviation	Std. Error Mean
CH_OCF	No	100	0.04087119	-0.679	4.775	0.496268386	0.049626839
	Yes	14	0.00323179	-0.131	0.122	0.059807596	0.015984253
CH_NI	No	100	0.00015495	-0.416	0.928	0.137752132	0.013775213
	Yes	14	0.02288358	-0.013	0.069	0.028737424	0.007680400
SIZE	No	100	19.80146972	16.342	22.876	1.150246260	0.115024626
	Yes	14	20.57117185	17.859	23.726	1.880397138	0.502557274
AGE	No	100	13.03	0	23	3.823	0.382
	Yes	14	15.14	9	22	4.074	1.089

Source: estimated according to data from authors' database (2019)

The average annual change in operating cash flow and net income are close to zero, indicating that all companies, regardless of the cash flow information disclosure practice, reported almost unchanged values of operating cash flows and net income from period to period. However, the spread between minimum and maximum values as well as high standard deviation in the group of non-disclosing companies shows large dispersion among companies. This is not the case in disclosing cash flow information group, both for operating cash flows and net income variables. On the other hand, the spread between minimum and maximum values and high standard deviation for variables size and age is evident in both disclosing and non-disclosing cash flow information groups. Furthermore, parametric t-test and non-parametric Mann-Whitney U – test are used to statistically test the difference in mean values between groups. The obtained result of the parametric test indicates that there is a statistically significant difference in the mean values of the variable age between the group of companies that voluntarily disclose cash flow information and those who do not (t-test -1.831; sig.= 0.085). Similarly, non-parametric Man-Whitney U test result shows that the average value and the rank of number of years that shares are listed on the capital market among companies classified according to the voluntary cash flow information reporting practice are not equal (sig.= 0.071) as well as the average value and the rank of variable annual changes of net income (sig.= 0.044).

4.2. Multivariate analysis

Binary logistic regression data analysis as multivariate analysis method is used to test hypothesis about probability that company will voluntarily disclose cash flow information. Based on theoretical background and relevant previous research, following model is developed:

$$CFD_i = \beta_0 + \beta_1*\Delta CFO_i + \beta_2*MTHD_i + \beta_3* DIV_i + \beta_4*\Delta NI_i + \beta_5* SIZE_i + \beta_6*MKT_i + \beta_7*NEWS_i + \beta_8*AGE_i + e_i$$

where:
CFD_i = dummy variable, equals 1 if company *i* voluntarily announces any cash flow information, 0 otherwise
ΔCFO_i = change in operating cash flow of company *i* in year *t* with regard to year *t-1*
$MTHD_i$ = operating cash flow reporting method for company *i*
DIV_i = dummy variable, equals 1 if company *i* payout dividend, 0 otherwise
ΔNI_i = change in net income of company *i* in year *t* with regard to year *t-1*
$SIZE_i$ = average size of company *i*
MKT_i = stock market listing segment for company *i*
$NEWS_i$ = dummy variable, equals 1 if company *i* announce any news, 0 otherwise
AGE_i = number of years that company *i* list its shares at stock market
e_i = error term of the model.

Results of conducted logistic regression analysis are shown in the table below:

Table 4: Binary logistic regression model

Variable	B	Wald	Sig.
ΔCFO	-0.590	0.209	0.648
MTHD	-0.040	0.001	0.974
DIV	0.192	0.066	0.797
ΔNI	5.080	1.906	0.167
MKT	-0.482	0.327	0.567

Variable	B	Wald	Sig.
NEWS	0.493	0.400	0.527
AGE	0.168	3.578	0.059
SIZE	0.765	4.888	0.027
Constant	-19.863	7.586	0.006

-2 Log likelihood = 72.70;
Cox & Snell R^2 = 0.102; Nagelkerke R^2 = 0.194
Source: estimated according to data from authors' data base (2019)

Table 2 presents the results for binary logistic regression analysis on 114 observations. Cox & Snell and Nagelkerke pseudo R Squares, as well as -2 Log likelihood and Hosmer and Lemeshow test of likelihood ratio, indicate a relatively good model fit and confirm overall model significance. Also, in order to detect potential multicollinearity problem among independents, Variance Inflation Factor (VIF) are calculated. As obtained VIF values range from 1.066 (variable AGE) to 2.202 (variable ΔNI), it can be concluded that there is no indication for multicollinearity to be present.

The results of Wald statistic tests show that the size of the company is found statistically significant at the 0.05 level, while age is found statistically significant at the 0.1 level. Both variables are positively correlated with the probability of voluntary cash flow disclosure, indicating that the possibility of cash flow voluntary disclosure increases in larger companies, as well as in companies whose shares are listed on an organized securities market for a long time. The results of variable size testing are consistent with previous research (Aljinović Barać, 2012; Juhmani, 2014; Taran et al., 2017; Kundeliene and Stepanauskaite, 2018) and indicate that larger, more noticeable companies with more complex activities and more stakeholder groups whose demands must be satisfied will have a higher level of cash flow information disclosures.

The results of variable age testing support the argument that companies which operate longer and list its shares on the stock market for a longer time will need more communication to the outside community (Juhmani, 2014), as it is positively correlated with the voluntary cash flow disclosure. However, it is interesting to note that this finding differs with regard to Aljinović Barać (2012) results on extensive disclosures practices of Croatian large companies whose shares are listed on the Zagreb Stock Exchange. As the average number of years of listing shares at the stock market is pretty high (13 years for companies in non-disclosing and 15 years for companies in disclosing cash flow information group), the possible explanation for this change in trend could be in a small number of new-entries companies. Thus, the existing issuers are "getting older" and they have to keep extensive cash flow disclosure information practice to maintain a good public image.

All remaining variables are not found statistically significantly correlated with the probability that the company will voluntarily disclose cash flow information. Contrary to the expectations, the findings revealed that other independent variables (i.e. changes in operating cash flows and net income, operating cash flow reporting method, payout dividend, stock market listing segment and news announcements) do not appear to be significant in explaining the probability that company will voluntarily disclose cash flow information.

5. Concluding remarks

The primary goal of this paper is to analyse the characteristics of companies that provide extensive cash flow disclosure. Obtained results indicate that that company size as well as stock market listing duration (in years) significantly and positively affect the voluntary disclosure of

cash flow information in the annual report of Croatian companies. All remain variables tested are not found to be statistically significantly related to the cash flows information voluntary disclosure level. It can be concluded that despite the desire of the regulatory authorities that capital market investors receive all relevant information, voluntarily cash flow disclosure is not apparent in Croatia and companies voluntarily disclose additional information about cash flows very rarely.

Summarizing theoretical and empirical results of the research, the following recommendations can be derived: (1) the international standard setters and national legislative authorities should (a) constantly draft and propose amendments and laws in order to achieve precise definitions and full harmonization of the statement of cash flows in order to avoid considerable misinterpretation, (b) rethink about consistent favouring of direct method mandating and consequently of changes in Statement of cash flows structure; (2) national legislative authorities should (a) aim to make mandatory the publication of cash flow statement for all entities (b) define and enforce full disclosure practice, especially for capital market participants; (3) future researches should aim to explore cash flow reporting practices in more detail, e.g. in different regulatory framework countries, with regard to different company's characteristics, with regard to different financial performance measures, etc.

AN ENTREPRENEURIAL APPROACH TO SUSTAINABLE DEVELOPMENT OF SPECIFIC TYPES OF TOURISM IN THE EASTERN CROATIA

ABSTRACT

Tourism potential of Eastern Croatia is extremely high. It represents an area of diverse and preserved natural environment and numerous traditional values. Due to the fact that during the process of transformation and privatization Eastern Croatia lost most of its former successful enterprises, it is increasingly turning to the tourism industry. In recent years it has become recognized as a region offering a rich assortment of tourism products. The aim of this paper is to explore entrepreneurial opportunities for sustainable development of specific types of tourism in Eastern Croatia. The basic hypothesis of this paper is: "Eastern Croatia has significant potential for the development of specific forms of tourism through entrepreneurship programs.". A method that will be used in this paper is a method of survey among experts in the field of tourism and the results will be processed by the method of descriptive statistics. Although over the years the Croatian economic policy has predominantly favored the coastal destination, in recent years these trends have changed and destinations of continental Croatia are becoming increasingly important. This is favored by new sources of investments from EU funds that encourage various forms of entrepreneurship. The specificity of tourism of Eastern Croatia is the richness of various forms of supply that are going beyond the concept of development of sun and sea tourism. Previous studies have shown that Eastern Croatia receives a large part of tourist traffic during the tourist events (Vinkovačke jeseni, Jesen u Baranji, Đakovački vezovi, Aurea fest Požega, Osječke ljetne noći, etc.). In this paper, certain segments of tourism offer of Eastern Croatia will be presented through an overview of specific types of tourism in this region (rural tourism, manifestation tourism, gastronomic tourism, etc.) and their valorisation through various entrepreneurship programs.

Key words: specific types of tourism, Eastern Croatia, entrepreneurship in tourism.

1. Introduction

1.1. The subject of this paper and the research objective

This paper investigates special interest tourism within the concept of rural tourism development in Eastern Croatia. It is known that rural tourism is extremely developed in the EU countries, but in Croatia it is only in the beginning of its development. The development of rural tourism in EU countries is evidenced by research by numerous authors such as Alexander, McKenna, Baćac, Gartner, George, Lane, Lebe, Oppermann, Petrić and others. The subject of this paper is the sustainable development of special interest tourism in Eastern Croatia from the entrepreneurial perspective. Given that in this area, most of the once successful enterprises were lost during the transformation and privatization, it is increasingly turning to the tourism industry, which has produced significant results in recent years. The fact that the economic policy of the country for years favored destinations of the coastal Croatia and neglected the destinations of Eastern Croatia, led to a pronounced seasonality of Croatian tourism (the "sun and sea " concept). In recent years, this trend has slowly begun to change, especially since Croatia became a full member of the European Union. The aim of this paper is to explore entrepreneurial opportunities for sustainable tourism development in Eastern Croatia. Certain entrepreneurial opportunities are presented through the valorisation of special interest tourism. Special interest tourism represent certain types of tourism "which are based on the specific tourist interests for the contents and activities in a particular tourist destination " (Bartoluci, M., Škorić, S., 2009, pg. 1). They are based on tourists' motives for destinations that can optimally satisfy their special interests such as: health promotion motives, cultural introductions, sports and recreation motifs, gastronomic motives, religious motives, etc. Such motives form special interest tourism such as: health, cultural, sports, gastronomic, religious tourism, etc. (Bartoluci, 2013, p. 185). This paper evaluates those special interest tourism that are already developed today or are in the phase of development in Eastern Croatia.

1.2. Research methods

The main hypothesis of this research is: "Eastern Croatia has significant potential for the development of special interest tourism throughout entrepreneurship programs." In accordance with the hypothesis, a survey was conducted among experts and entrepreneurs in the field of tourism. Starting from the main hypothesis of this research according to which Eastern Croatia has significant potentials for the special interest tourism development throughout entrepreneurship programs, the paper will use the method of survey among experts in the field of tourism, and the results will be analyzed by the method of descriptive statistics. This will give a more concrete insight into the current state of Eastern Croatia's tourism offer and some recommendations for its improvement.

2. Analysis of the tourist offer in Eastern Croatia

Croatia belongs to the group of countries that attract visitors primarily with the richness of its natural space and cultural and historical heritage with quality, available and / or various modern tourist attractions (Bilen, „Turizam i okoliš", 2011, p. 136). The most important place among natural attractions has more, indented coast and numerous islands, but also the preservation of natural beaches, greenery and forest cover of a large part of the territory. Observing its total area (56,594 km², DZS), there is an extremely large number of attractive tourist protected natural areas, and according to biodiversity, Croatia belongs to the top of the European countries. The tourist valorization of the area in the still underdeveloped tourist areas of Eastern

Croatia along the Danube, Sava, Drava and other rivers, as well as lakes and other inland waters, represents an extremely great potential. Eastern Croatia covers the area of five Slavonian counties Osiječko-baranjska, Vukovarsko-srijemska, Virovitičko-podravska, Požeško-slavonska and Brodsko-posavska. This area is known for its plains, oak forests, picturesque vineyards and old cellars and numerous baroque palaces and churches. Each of these counties has its own comparative advantages that contribute to positive tourism results. Previous research has shown that the majority of tourists arrive during tourist events such as Vinkovačke jeseni, Đakovački vezovi, Aurea fest Požega, Jeseni u Baranji, Osječke ljetne noći and many others, when numerous tourists and visitors have the opportunity to get acquainted with the original folklore heritage, picturesque folk costumes, soothing tambourine sounds and unique culinary specialties.

Although Croatia has about 92% of rural space, rural tourism is one of the least developed forms of special interest tourism, which participates in the total income from tourism with only 1%, and in this area the conditions for the development of this form of tourism are particularly pronounced. The main reason for this situation is the neglection of the development of rural tourism due to many years of investment in the development of sun and sea tourism in the coastal area of Croatia. Bartoluci et al. (2018) point out that tourism in rural areas is one of the most promising complementary economic activities in Croatia and that it should continuously and systematically strive for its sustainable development.

Given that much of Eastern Croatia's territory is made up of rural areas, conditions for the development of rural tourism are particularly pronounced in this part of Croatia. Rural tourism is every tourist activity in the rural area, except here rural tourism includes cyclotourism, adrenaline, mountain, health, eco-tourism and many other specific forms of tourism (Rural tourism - general information, 2020). Family run farms that offer accommodation and catering services are especially popular in Eastern Croatia. Family run farm is an organizational form of economic entity of a natural person - farmer who independently and permanently carries out the activity of agriculture and related supplementary activities, based on the use of own and / or rented production resources and on the work, knowledge and skills of family members (Family Law agriculture (2018)). There are currently 162,966 family farms operating in Croatia, of which 37,233 in Eastern Croatia, almost 23% of them.

Today, there are about 500 tourist rural family farms in Croatia, of which about 80% are excursion farms, which means that they have tasting rooms and offer a visit to the property, while 20% of them have accommodation facilities (Ministry of Tourism, 2019). The number of tourist rural family farms is growing, as is the number of other service providers related to activities in rural areas. Thus, the offer of rural tourism is developing (Galijan et al., 2017). The largest number of providers of rural tourism is located in the County Dubrovačko-neretvanska, while in second place is the County Osiječko-baranjska, which is also the most visited county in Eastern Croatia.

According to the Central Bureau of Statistics, in 2018 Croatia was visited by slightly more than 18.5 million tourists who spent almost 90 million nights. Almost 89% of all arrivals and overnight stays are made by foreign tourists on the coast, while continental Croatia realizes just over 13% of tourist arrivals. Eastern Croatia accounted for just over 1% of tourist arrivals and overnight stays, but unlike the rest of Croatia, the largest number are domestic tourists.

Until recently, it has not been paid enough attention to Eastern Croatia, but new trends in the world tourism market are showing the change in behavior of tourists trying to experience as many different experiences as possible during their journey. Also Croatia's accession to the EU, has proved that Eastern Croatia is a hidden pearl with a large development opportunities, and tourism is emerging as a driving force for regional economic development.

3. Development opportunities of special interest tourism

Firstly, Croatia is known as summer holidays destination with the highest concentration of tourists on the coast. Special interest tourism are develped in order to alleviate the problem of seasonality and reduce the concentration of tourists. The introduction of the concept of special interest tourism does not imply the simultaneous emergence of some new type of tourism, but the implementation of a new concept of development of a tourist destination that is oriented towards demand and its specific needs, based on sustainability and systematic principle of market research. Special interest tourism ensure slow, long-term, locally controlled and regulated development. They can generate more revenue for all market entities, employ more local labor force and significantly stimulate family entrepreneurship (Kesar O. Specifični oblici turizma kao nositelji održivog razvoja destinacije, Turizam i sport - razvojni aspekti, 2007.). The richness of the natural and cultural-historical heritage makes a great strength of the resource-attraction of Eastern Croatia. There are numerous possibilities for the development of special interest tourism in Eastern Croatia such as congress, religious, hunting and fishing, one-gastronomic, nautical, manifestation tourism, etc. Some of these are discussed below

The development of tourism in Eastern Croatia is based on preserved natural resources, offering quality and indigenous food, viticulture, extremely valuable cultural and historical resources, manifestations and ethnographic interest.

Congress tourism is a special interest tourism in which the main traveling motif is not the rest, but the participation of individuals in meetings that may have different character. Visitors in congress tourism are not leisure travelers because they travel because of a specific need that is most commonly associated with their workplace. Although congress tourism is a business trip that is often required and conditioned by a job, task, or project, all travel receptive countries are very happy to classify these travelers as tourists, adding revenue from congress tourism to total tourism revenue. In accordance with the characteristics of participants attending various gatherings, congress tourism is considered as one of the most lucrative types of special interest tourism. According to a 2015 report by the International Congress and Convention Association (ICCA), business and convention tourism, including meeting tourism (MICE), make up almost a quarter of total international tourism in arrivals and foreign exchange inflows. The big advantage of congress tourism is certainly the higher consumption of congress tourists compared to traditional tourists, and in addition to the higher consumption and the extension of the season, congresses greatly contribute to strengthening the image of the country. Meetings can have scientific, professional, economic and other content (Kongresni turizam - opće informacije, 2017).

In this part of Croatia, this type of tourism is most often carried out in Osijek and other major cities (Đakovo, Vinkovci, Vukovar, Slavonski Brod, etc.). Most of these events take place at colleges, hotels, etc. Congress tourism has an excellent prospect, firstly thanks to hotels that have large halls equipped with modern equipment and can fully satisfy the increasingly demanding business clientele, as well as the richer accompanying tourist offer.

Gastronomy is the skill of knowing and preparing meals, choosing drinks and serving guests. Food in tourism has two roles, the first is the consumption of food to meet the physiological needs of the destination, and the second is for individual tourists to choose a specific destination for tasting local specialties (Gastronomski turizam - opće informacije, 2017.). This type of tourism is especially developed in Eastern Croatia, with family run farms throughout Eastern Croatia playing an important role. According to the Agricultural Law, family run farm is an independent economic and social unit made up of adult members of a common household, based on the ownership and / or use of production resources in the conduct of agricultural activities (Agricultural Law, OG 30/15). Family run farms make a big contribution by ensuring the use of natural resources, preserving biodiversity, demonstrating resilience and adaptability

in crises, and contributing to the preservation of tradition, identity and cultural heritage (Tušek, K., (2014.) "Uloga i značaj obiteljskih poljoprivrednih gospodarstava u Republici Hrvatskoj"). This area offers a rich assortment of indigenous Baranja and Slavonia specialties such as game stew, river fish specialties, dried meat products, etc. The marketing of indigenous products must be one of the significant goals of tourism development in rural areas. Indigenous products are protected by geographical indications for the sake of identity creation and recognition and a higher price category. In addition to promoting and selling indigenous products, they are a direct help to manufacturers in strengthening the market. Indigenous products are significant to the community and play a role in preserving culture and heritage.

Manifestation tourism is the name for all types special interest tourism motivated by the holding of various manifestations, cultural, scientific, business, sports, entertainment and similar in character and content. Recent studies have shown that most tourist visit Eastern Croatia during tourist events, which proudly preserve and nurture Croatian traditional culture and heritage. In addition to a rich traditional and cultural program, they also offer a rich gastronomic program. Some manifestations will be listed below.

Vinkovačke jeseni is a twelve-day manifestation that takes place in September in city of Vinkovci, and from the very beginning they have been discovering popularized and promoted tourist values of this city and its wider surroundings. During the twelve days, visitors can see the old folk customs and folklore events, enjoy the gastronomic specialties of the area and much more. Vinkovačke jeseni usually start on Wednesdays and last until next Sunday. On Sunday (the 12th day of the event), visitors gather in the main town square to see an event by cultural and artistic societies from all over Croatia (mostly from Eastern Croatia). Apart from a large number of visitors, the event is also very well attended by the media. It is estimated that over the past five decades, Vinkovačke jeseni have been watched directly by around 5 million viewers.

Aurea fest Požega is an event that takes place during the last weekend in August in city of Požega. A large "tamburica" concert by various performers takes place in the city center, and besides numerous visitors, this event attracts many displaced people from Požega from all over the world. It is a superb blend of traditional and urban, offering a unique musical, entertaining and gastronomic story for half a century.

Apart from the aforementioned, the Nature Park Kopački rit is one of Europe's largest preserved natural wetlands. The park is home to numerous plant and animal species, and deep in the dense oak and maple forest is the Tikveš Hunting Castle, once the famous imperial residence of the Habsburg family. There are numerous possibilities for further development of rural tourism in this area, and accommodation in houses of traditional construction and development of agritourism and eco agriculture, the inclusion of cultural, historical and architectural heritage in tourism ethnographic workshops of old crafts and the like, would certainly enrich the tourist offer of the entire area.

4. Results of the survey

For the purpose of writing this paper, a primary survey was conducted on a sample of 45 respondents, experts in the field of tourism and entrepreneurship. This research seeks to explore the level of development of rural tourism and other forms of special interest tourism and the further possibility of their development.The aforementioned research was conducted by the method of a questionnaire, and the results obtained are presented in this chapter.

The questionnaire itself consists of 9 groups of questions through which the respondents evaluated the tourism offer of Eastern Croatia.

A.1. Most respondents rated the level of rural tourism development as 3 (51%) or 2 (42%). According to the respondents, the level of development of rural tourism in relation to

competing countries is low or very low (over 60%). (Processed by authors according to the results of the survey, March 2020)

A.2. The level of development of individual types and special interest tourism in Eastern Croatia was evaluated by the majority of respondents with a grade of 3 (urban, rural, congress, religious, gastronomic, etc.). (Ibidem)

A.3. According to the answers of the respondents, the majority of respondents believe that special interest tourism have a fairly good or big development chance in Eastern Croatia, and rated most specific forms of tourism as 5 or 4 (rural, gastronomic, hunting and fishing, memorial, congress, etc.). (Ibidem)

A.4. Most respondents (53.3%) rated the integrated tourism product as having a good degree of economic sustainability, while 24.4% said the integrated tourism product had very good economic sustainability. However, 6.7% consider the integrated tourism product to have a high degree of economic sustainability. This supports the hypothesis of this paper that Eastern Croatia has significant potential for the development of special interest tourism through entrepreneurship programs, which means that the concept of developing specific forms of tourism in Eastern Croatia could be economically viable. (Ibidem) Similar results were obtained by the authors of an earlier study (Bartoluci, M., Hendija. Z., Petračić, M., 2015, p. 212) in which 77% of surveyed tourism experts answered that it is necessary to create and develop integrated tourist products in rural tourism and not offer them as individual market attractions.

A.5. Most respondents (almost 85%) rated Eastern Croatia's destinations as attractive. (Ibid)

A.6. Of the many motives for visiting a tourist destination, the respondents rated most of them with a score of 5, which proves that tourists to Eastern Croatia are attracted to indigenous gastronomy, manifestations, sports and recreation, behavior and customs of the local population, natural beauty, etc. This also supports the hypothesis of this paper. (Ibidem)

A.7. This group of questions refers to the reasons for starting entrepreneurial activities in rural tourism. Respondents rate the most important reasons for starting entrepreneurial activities in rural tourism with high marks. Among the most important are: increase in household income (75%), placement and sale of own products (67%), employment of family members (72%), expansion of activities (59%). This confirms the interests of entrepreneurs in starting entrepreneurial activities such as family farms, rural households, etc. (Ibidem)

A.8. Most of the respondents estimated that there are quality accommodation capacities in rural tourism in Eastern Croatia, but that they still do not have enough in relation to the real needs and potentials for tourism activities in this area. This applies to tourist family farms, small family hotels, campsites, etc. (Ibidem)

A.9. Respondents also assessed the real tourism demand in rural tourism in Eastern Croatia. This applies to domestic and foreign demand, to tourists who have spent nights and visitors. Respondents rated the domestic demand of excursionists with the highest ratings (good or very good, 73%). The demand for domestic tourists receiving overnight stays (71%) was slightly lower, which is understandable because a large part of these visitors stay with relatives or friends and do not spend overnights. Also, foreign visitors (whether staying overnight or not) are generally rated as good 3, which means that foreign demand is average and of lower intensity than domestic demand. Based on the assessment of potential and real tourist demand, it is possible to conclude that there is a favorable tourist demand for one-day visitors (excursionists), while assessing the slightly lower interest of overnight tourists. This also supports the hypothesis that there is a real and potential demand for entrepreneurial activities in tourism in Eastern Croatia. (Ibidem)

5. Conclusion

The subject of this paper was to explore the possibilities of sustainable development of special interest tourism in Eastern Croatia from the entrepreneurship point of view, while the aim of this paper was to explore the entrepreneurial possibilities of sustainable tourism development in the area of Eastern Croatia. Since the economic policy of the country for years has favored tourism in coastal destinations, this area has been neglected, but in recent years this has changed so that Eastern Croatia attracts more and more tourists every year.

Given that much of Eastern Croatia's territory is made up of rural areas, conditions for the development of rural tourism are particularly pronounced in this part of Croatia. However, in addition to rural areas, congress, gastronomic and manifestation tourism i is especially developing in this area.

The main hypothesis of this research is: "Eastern Croatia has significant potential for the development of special interest tourism throughout entrepreneurship programs." In accordance with the hypothesis, a survey was conducted among experts and entrepreneurs in the field of tourism. Respondents evaluated the current tourism offer of Eastern Croatia throughout a questionnaire and pointed out the development needs and opportunities. Most conclude that Eastern Croatia has great development opportunities in many types of tourism and that the integrated tourism product in Eastern Croatia's destinations has a very good economic sustainability. Similar results are shown by some other research in rural tourism that advocates the creation of an integrated tourism product of the entire region, because such a development concept has a perspective on the future development of rural tourism (Lebe and Milfelner, 2006, p. 1144). This confirms the entrepreneurs' interests in starting entrepreneurial activities such as family run farms, rural households, etc. The respondents rated the most important reasons for starting entrepreneurial activities in rural tourism. Respondents assessed that Eastern Croatia has quality accommodation capacities that are still insufficient to meet all existing and potential tourist demand. It was also estimated that there was favorable domestic and foreign tourist demand for Eastern Croatia destinations. Most respondents rated the integrated tourism product has a good degree of economic sustainability, while 24.4% considered the integrated tourism product to have very good economic sustainability.

This supports the hypothesis of this paper that Eastern Croatia has significant potential for the development of special interest tourism throughout entrepreneurship programs, which means that the concept of developing special interest tourism in Eastern Croatia could be economically viable.

GLOBALIZATION AND DEVELOPMENT OF THE SMALL AND MEDIUM ENTERPRISES IN THE EU

ABSTRACT

The EU economy and other world economies are significantly influenced by globalization. This process includes freedom of movement of production factors on the global market. Globalization affects all segments of the economy, and especially small and medium-enterprises, which occupy the largest share in the structure of enterprises, in employment and the overall added value. The research problem of this paper stems from the still unknown effects of globalization processes on the European small and medium enterprises Globalization could result in potential negative effects on competitiveness, labor market, and the emergence of various forms of unfair trading practices. This research aims to provide an overview of the theoretical aspects of globalization, to analyze the current state of small and medium enterprises on the EU Internal Market and to identify scientifically based challenges and perspectives of the development of European small and medium enterprises in the context of globalization. The purpose of the research is to determine the effects of globalization processes on European small and medium enterprises. By conducted research, positive effects of globalization on the European small and medium enterprises were identified. Effects of globalization are mostly evident in increasing numbers of active enterprises, increasing levels of employment and total value added. On the other side, the key challenges of the small and medium enterprises in the context of globalization arise from new demands of consumers and problems in finding adequate workforce. The conducted research is based on secondary data collected from relevant international statistical databases and official publications and research of European and international organizations.

Key words: *EU, globalization, Internal market, small and medium enterprises.*

1. Introduction

Globalization is a comprehensive and complex process that has 'captured' the World and Europe after the end of World War II. The basic point of this process was to ensure peace and long-term stability, which are complemented by other economic and social goals (Krešić,

1996). Globalization seeks to comprehensively open up the world economy by removing existing qualitative and quantitative barriers. Therefore, according to Natek and Natek (2000), it is impossible not to mention its connection with the establishment of the General Agreement on Tariffs and Trade (GATT) and its basic principles (reciprocity, liberalization and non-discrimination). Therefore, the foundations of globalization processes rest on liberalization, which refers to the reduction and removal of customs and other barriers, with the aim of facilitating international economic activities.

Given the complexity of the term, there is still no consensus among economic theorists on its definition. According to Dujšin (1999), globalization implies the international integration of factors of production, while Turek (1999) defines globalization as a social process which aims to achieve unity worldwide. Relying on the theory of globalism, Rodin (1999) states that the globalization processes significantly change the population paradigm about the world, the economy and their legitimacies. A comprehensive approach to defining this term is given by Milardović (1999), according to which globalization, which makes the world smaller and smaller, emerges as a result of changes in science, technology, business practices and due to reforms of political systems. As such, it has enabled the free movement of production factors at national and global levels. According to Muller (2006), globalization has resulted in the increasing erosion of the nation-state and the ceding of powers to supranational structures.

Lončar (2005) highlights multinationals as a central element of globalization, which have a significant impact on the economies of transition countries. According to Dragičević (1996), multinational companies transfer capital and resources from one country to another, thus forming specific levels of economic performance and significantly affecting the labour market. Also, according to Lončar (2005), multinationals have become more powerful than nation states. The effects of globalization can be viewed through its economic and political/legal aspect (Dujšin, 1998). Zsifkovis (2000) points out that globalization results in positive effects for the world economy, since it triggers the deployment of factors of production and thus contributes to the achievement of global well-being. Milardović (1999) also emphasizes the importance of considering cultural, environmental and social aspects of globalization processes. Moekotte and Freye (2008) emphasize that the globalization and domination of multinational companies result in adverse effects due to the increasing exploitation of resources and the inability of nations to preserve national identity.

Globalization trends significantly affect the way the European small and medium enterprises (SMEs)[1] do business. SMEs set in motion the whole European economy. According to the European Commission (1) (2019), SMEs make up 99.8% of European businesses, generate 66.6% of the total employment and participate in 56.4% of total European added value. In the context of globalization, there is a growing need for SMEs in terms of constant investments in R&D (Tomljanović, 2017), with the ultimate goal of higher productivity and international competitiveness. Such contemporary challenges have resulted in increased needs for modernization of business processes, as well as skilled and adaptable workforce; while the share of low-skilled workers is shrinking and they are becoming the most vulnerable group on the labour market (Timmermans and Katainen, 2017).

The research problem of this paper stems from the still unknown effects of globalization processes on the European small and medium enterprises. Globalization could result in potential negative effects on competitiveness, labour market, and the emergence of various

---

[1] According to the classification of the European Commission (2) (2019), the group of small and medium-sized enterprises includes enterprises with fewer than 250 employees and an annual turnover of less than EUR 50 million.

forms of unfair trading practices. This research aims to provide an overview of the theoretical aspects of globalization, to analyze the current state of small and medium enterprises on the EU Internal Market and to identify scientifically based challenges and perspectives of the development of European small and medium enterprises in the context of globalization. The purpose of the research is to determine the effects of globalization processes on European small and medium enterprises.

The study is divided into six interconnected sections. The study begins with introductory considerations explaining the concept of globalization and its relationship with SMEs. Basic elements of the research are then defined. Following the introduction, the research methodology is presented, followed by a statistical analysis of key indicators for the development of European SMEs in the context of globalization. The analysis carried out formes the basis for the determination of scientifically based challenges for the development of European SMEs in the context of globalization. The paper ends a synthesis of key findings obtained during the research.

2. Research methodology

The paper brings a descriptive analysis of European SMEs in the context of globalization. The secondary data used were collected from Eurostat and the World Bank. Depending on the availability of the data, it covers the period 2009-2018. The KOF index was used as an indicator of globalization. It measures economic, social and political globalization. Economic globalization refers to the flows of money, capital and transactions, the social one implies interaction with other countries, while the level of political globalization evaluates the involvement and adaptation to international politics (Dreher, 2006). The situation and development of European SMEs has been analyzed using business demography indicators, which include: (a) the number of active enterprises; (2) the number of start-ups; (3) the number of failed businesses; (4) employment in European SMEs. Performance indicators of small and medium-sized enterprises are also analyzed; through trends of the: (a) Value added (2008 = 100), and (2) Real labour productivity per hour worked (2010 = 100). The adaptation of European SMEs to the conditions of globalization has been analyzed using innovation indicators, which include: (1) R&D funded by business enterprise sector (% of total); (2) High tech export (% of manufactured export); (3) Share of turnover of enterprises on e-commerce (%); (4) Employment in high tech sectors (% of total employment); (5) Human resources in science and technology (HRST, % of active population).

3. Analysis of European small and medium-sized enterprises in the context of globalization

The data from Table 1 indicate that 26 EU Member States have improved their positions with respect to the KOF Globalization Index over the observed period, compared to the beginning of the period. However, a more detailed analysis indicates that the global economic crisis has had a significant impact on globalization indicators of European countries, while the largest fluctuations were recorded in the period 2009-2013. Thereafter, growth has mainly resumed and went on until 2017. Most recent reports indicate that Switzerland is the leading country according to the KOF Globalization Index, followed by the Netherlands, Belgium and

Sweden. Furhermore, it should be noted that among the top 10 countries according to the KOF Globalization Index, there are 9 EU Member States.[2]

Table 1: KOF Index of Globalisation in EU Member States in the period 2009 – 2017

Year Country	2009	2010	2011	2012	2013	2014	2015	2016	2017
Austria	88.5	88.2	88.4	88.6	88.3	89.4	89.0	89.0	89.1

Source: Dreher (2006); Gygli et al. (2019)

Positive globalization trends are accompanied by positive trends of business demographic indicators (Table 2), which include: the number of active enterprises in the EU, the number of start-ups, the number of failed enterprises and the number of employed in active enterprises. All during the period of 2009-2017. Available data suggest that the EU has seen an increase in the number of active enterprises and the number of start-ups. An increase in the number of active enterprises has been achieved in 20 Member States, while the countries with the largest number of active enterprises are Italy, France, Spain and Germany. In the case of start-ups, positive developments were made in 19 Member States, with the highest values being achieved by France, the United Kingdom and Spain. However, a more thorough analysis needs to be carried out with these indicators. A survey of the situation in all Member States

---

[2] EU's most significant „competitors" are ranked as following: the USA (23rd), South Korea (34th), Japan (37th), Russian Federation (51st), and China (80th).

indicates that the greatest fluctuations of individual indicators were recorded in the period from 2009 to 2013. That is the crisis and post-crisis period. Also, negative effects of the economic crisis have been more intensive in the more advanvced countries, whose business environments represent the drivers of European entrepreneurial activity. This is evidenced by the fact that during the observed period the number of failed enterprises in the EU increased – which has been reported in 15 Member States; especially in Italy, Spain and Germany. However, the trend of the increasing number of failed enterprises is not only a consequence of the negative effects of the economic crisis but also of the new challenges of globalization – in the form of increased competition, technological changes, education, training and the need for internalization (which has been analyzed in more details in the following sections oft he paper). In the observed period the EU also recorded an increase in employment in active enterprises; which was reported in 19 EU Member States.

Table 2: Indicators of business demography in EU Member States in the period 2009 – 2017

Indicator Year	Number of active enterprises	Number of start - ups	Number of failed enterprises	Number of employed in active enterprises
2009	23,986,411	2,375,474	n.a.	137,600,773
2010	24,052,852	2,327,763	2,171,156	135,000,000
2011	25,159,092	2,388,541	2,310,451	139,895,715
2012	25,766,957	2,372,394	2,270,051	140,577,347
2013	25,928,099	2,469,750	2,215,838	138,513,217
2014	26,227,556	2,581,083	2,100,000	142,913,930
2015	26,540,130	2,549,753	2,070,000	144,000,000
2016	26,982,729	2,641,664	2,225,852	150,000,000
2017	27,522,200	2,659,318	2,200,000	150,000,000

Source: authors; according to Eurostat (1)(2019)

Furthermore, data from the European Commission (2019) indicate a constant increase in the value added of SMEs and an increase in labour productivity (Eurostat (2), 2019). The improvements identified so far in the demographics and performance of European SMEs could be linked to their increasing orientation to innovativeness indicators (Table 3).

The data in Table 3 indicate that the scientific and research activity of SMEs in the EU has risen in the observed period. Within that, business sector investments in R&D activity increased to 58% of total R&D investments in 2017. The increasing orientation of the business sector to modern sources of competitive advantage should also contribute to the creation of new, high-tech products, which should gain a significant share in exports. However, the data suggests that the situation varies and a decrease has acctually been recorded since the beginning of the period. This situation poses a significant challenge in the further enhancement of business activities of SMEs.

Table 3: Innovativeness indicators of European Small and Medium Enterprises

Indicator Year	R&D funded by business enterprise sector (% of total)	High tech export (% of manucaftured export)	Share of turnover of enterprises on e-commerce (%)	Employment in high tech sectors (% of total employment)	Human resources in science and technology (HRST, % of active population)
2009	54.1	17.35	12	5.60	40.1
2010	53.8	17.57	14	5.50	40.8
2011	55	16.93	14	5.60	42.3
2012	55.1	17.43	15	5.60	43.1
2013	55.2	17.48	14	5.60	43.8
2014	55.5	17.40	15	5.70	44.5
2015	55.3	18.00	17	5.70	45.2
2016	57	18.24	16	5.80	46
2017	58	16.69	18	5.80	46.6
2018	n.a.	16.25	17	5.80	47.5

Source: authors; according to Eurostat (3)(2020), World Bank (1)(2020), Eurostat (4)(2020), Eurostat (5)(2020), Eurostat (6)(2020)

On the other hand, the pressures of globalization and the increasing emphasis on digital business transformation have influenced the orientation of businesses toward various forms of e-commerce. European SMEs are generating positive values in this segment and are generating 17% of total traffic through e-commerce activities. Furthermore, the increasing orientation to new technologies has also resulted in increased employment in the high technology sectors, which represent 5.8% of total employment. Also, related to that, there is an increase in human resources in science and technology in European SMEs, which accounts for 47.5% of the active population.

European SMEs, except for business demographics, are making some progress in innovation indicators, which is necessary to make them internationally competitive. Still, the EU lags behind its main competitors in key innovation indicators (Table 4).

Table 4: Comparison of EU and major competitors in key innovation indicators for 2017

Indicator Year	R&D (% of GDP)	R&D funded by business enterprise sector (% of total)	High tech export (% of manucaftured export)
EU	2.02	58	16.25
SAD	2.78	63.6	18.89
South Korea	4.55	76.2	36.64
Japan	3.2	78.3	17.26

Source: authors; according to Eurostat (7)(2020), Eurostat (3)(2020), World Bank (1)(2020)

South Korea is the world leader in key innovation indicators; especially given the total R&D investment and export of high technology products. The largest scientific research activity of enterprises is present in Japan. Considering the performances of the EU SME's it is obvious that it is lagging behind in all areas of innovation compared to its main competitors. This

basic overview fully affirms the thesis that it is necessary to direct further efforts of European policies, strategies and future action plans towards strengthening the scientific and technological fundaments of the European industry and its SMEs, especially to improve their competitive position and to address key challenges of globalization.

4. The effects of globalization trends on european small and medium-sized enterprises

Comprehensive globalization of the world economy and its related processes have created a new business paradigm, which has resulted in significant effects on European SMEs. Consequently, two opposing streams emerged, i.e. proponents of globalization and anti-globalization. Kostovski and Hristova (2016) indicate that advocates of globalization affirm the positive effects of the process on SMEs in terms of inclusiveness, connections and integration into global economic, social and political processes, resulting in the spill-over of knowledge and technologies, the spread of modern trends and positive effects to enterprises. On the other hand, anti-globalists deny the positive effects and identify globalization as a key source of global economic crises, increasing inequality and erosion of the welfare state. The dominance of individual effects largely depends on the willingness and ability of economic operators to adapt to new business conditions and their requirements.

Lee and Carter (2005) point out that globalization processes have contributed to market integration, trade liberalization and the development of innovations and other new success factors, which provide modern SMEs with new opportunities for business accomplishments. In such conditions, innovative SMEs stand out as the biggest 'winners', with their activities creating the foundations for increased competitiveness, as well as for facing increasing foreign competition – which has been identified as the greatest threat in a globalized business environment. Among other effects, the same authors also point to the dynamics and direction of movement of financial capital, concentration of capital and changes in the international division of labour. Lesakova (2014) states that globalization encourages small and medium-sized enterprises to improve the quality of business and manufacturing processes, which ultimately results in new, more advanced and higher quality products and services necessary to achieve international competitiveness. Similar views (United Nations, 2009) emphasize that the competitiveness and success of small and medium-sized enterprises in the context of globalization and trade liberalization are changing the structure and nature of exports, as the most important component of international trade. Thereat, international competitiveness can no longer be based solely on low prices, but the emphasis is on compliance with international standards, flexibility, product differentiation, as well as networking and international contacts. Moekotte and Freye (2008) state that business activities and the adaptation of SMEs to the context of globalization result in increased national well-being due to specialization of trade, decreased inflation, increased consumer benefits and changes in the distribution of natural, financial and human resources. In addition to positive effects, Moekotte and Freye (2008) cite the negative effects of globalization on SMEs, placing particular emphasis on the workforce and the conditions in which their required knowledge and skills are constantly changing, resulting in changes in qualifications and employment structure, especially present in developed countries.

Jambrek and Penić (2008) emphasize the orientation and development towards the implementation of the concept of the 'knowledge economy', which in its essence has a skilled, motivated and flexible worker, capable of facing contemporary challenges. In such a balance of power, those workers who do not have adequate knowledge and skills will find themselves in an unfavourable position on the labour market, whilst endangering their existence and other social aspects (Jakovljević et al. 2012). All of the above emphasizes the need to develop and

implement lifelong learning concepts. According to Ratten et al. (2007) SMEs often face a lack of resources needed to 'improve' and train workers, as well as to increase their innovative capacity. All of the above points to the need to strengthen and develop human capacities, which has been recognized as a key development goal in the works of contemporary economists (Tomljanović, 2017). There are also problems in securing financial, managerial and social capital. Furthermore, domestic markets, especially in smaller and less developed countries, often lack key resources, and therefore internationalization represents the only way to access technologies, resources and *know-how.*

Ristovska and Ristovska (2014) provide a comprehensive breakdown of the effects of globalization trends on European SMEs and classify them into three key groups: (1) The development of information and communication technologies; (2) economies of scale and cost reductions; and (3) „standardization" of the global consumer profile. According to this clasification, the increasing focus on R&D investment and their products has contributed to the rapid development of information and communication technologies (ICT), which are changing the ways of the modern business. At the same time it is necessary to distinguish a faster flow of information and the possibility of networking, which enable all companies (regardless of size, location, etc.) to have equal positions in international business. The effects of ICT development are clearly manifested by increased changes in international business, especially in terms of improving communication, decision-making and streamlining business costs. The increasing use of ICT is bringing about changes within the internal structures of enterprises and the division of labour, as well (Lesakova, 2014). Rapid access to new markets also opens up new opportunities for the effective absorption of technology and other missing resources, which largely determines their further development and progress (Frynas and Mellahi, 2011).

Furthermore, focusing on new sources of competitiveness and streamlining business inevitably results in economies of scale and diminishing costs. Likewise, a growing number of companies are focusing on opening branches and relocating manufacturing facilities to countries with lower labour costs, adaptive legislation and less stringent environmental legislation. Regarding consumers, which are a key element of the activities and strategies of SMEs, the characteristics and preferences are becoming more uniform. 'Uniformization' is especially present in the areas of education, lifestyle, purchasing power and preferences for high technology and quality (innovative) products. This phenomenon, in the context of international trade liberalization and the openness of international supply chains, offers great opportunities for SMEs to break through and compete in the global market. According to the European Commission (2019) the international activity of small and medium-sized enterprises is responsible for 1/5 of the growth of the living standards in EU Member States.

5. Challenges and perspectives of European small and medium-sized enterprises in the context of globalization

Research to date suggests that the greatest challenge for European SMEs within globalization is to achieve international competitiveness. Competitiveness is a complex and comprehensive term that has captured the attention of economic theorists over the last fifty years. However, given the differentiated views, it is very difficult to determine a single definition. Recent works define competitiveness as *"the ability of a country to maintain a balance of trade, create new jobs and ensure an increase of household incomes, in free and fair market conditions. At the same time, great emphasis was placed on satisfactory levels of investment, without increased levels of public debt and with respect for environmental goals"* (Djogo and Stanišić, 2016). Šegota et al. (2017) build on that approach, stressing that *"competitiveness is*

the ability of a country to achieve sustained economic growth, which ultimately contributes to increasing the well-being of the population, also assuming increased employment and reduced and/or stable levels of public debt. Besides the need to increase exports, countries also need to adapt to globalization trends, which places significant emphasis on R&D investment, increasing exports of high-tech products and creating a favourable environment for foreign direct investment." Taking into account the research of economic theorists to date, the authors consider that the *international competitiveness of European SMEs stems from their ability to maintain market positions vis-à-vis domestic and global competitors. The key element is the production of high value-added products with competitive prices. Likewise, importance of continued education and training for the workforce is emphasized, as a precondition for success in the global market.*

The competitiveness of small and medium-sized enterprises is closely linked to the efficient use of resources. According to Bel et al. (2018) competitiveness of an enterprise depends largely on the difference between its internal resources and the competitors' resources. Therefore, SMEs with developed patents, licenses etc. (intangible goods) should achieve more competitive positions. Modern business conditions encourage companies to operate outside their local or national market, which puts increasing emphasis on internationalization. According to Kunkongkaphan (2014), the existence of strong domestic competition has a positive effect on the efficiency and productivity of domestic enterprises and motivates them to become better. Therefore, SMEs are more motivated and open to approach to foreign markets. Still, achieving this position requires an orientation towards *"modern growth engines"* and constant development of high value-added products and services. *"Enterprises must have dynamic competitiveness, that is, to be able to respond flexibly, quickly and permanently to changes"* (European Commission (6) (2019)).

The challenges of European SMEs are evident from the European Commission's 2018 survey, which shows that the biggest problems for them are finding customers and the availability of skilled labour and experienced managers. Also, increased competition, legislation as well as labour and production costs were identified as significant issues. Some optimism stems from the fact that access to finances has not been put forward as 'the crucial' problem for SMEs. These results regarding challenegs potentially point to the effectiveness of European entrepreneurship policy and the provision of conditions for the use of direct and indirect financing (European Commission (3), 2019). In addition to these challenges and 'problems', a survey by the Association of Crafts and SMEs in Europe (2019) indicates that European SMEs perceive digitalization and its accompanying elements as the biggest challenge. In addition to globalization and digitization, significant challenges for European SMEs include: technological advancements, demographic changes, the business orientation towards environmental protection, the development of green products and services, and the circular economy.

In line with the abovementioned, in 2019 the EU conducted a survey on the innovation activities of SMEs. The survey identified key constraints on innovation activities in European businesses. The results indicate that European companies identify as the greatest obstacle to innovation activities a lack of internal and external sources of funding, high costs of undertaking scientific research activities, and a lack of required knowledge/skills within business systems. Also, growing competition and complicated procedures for accessing public tenders were recognized as limiting factors (European Commission (5), 2019).

Although the EU tries to affirm itself as an enabling environment for business development, it is faced daily with the fact that the population is less and less inclined to undertake

independent entrepreneurial activities. The reasons for this situation are multiple. According to the European Commission (4)(2020), 37% of EU citizens are prone to self-employment through starting their own businesses, which is noticeably lower level compared to the one in the USA and China (51%). Europe's key challenges in the area of entrepreneurial activity are the deficiencies in the education system (with particular emphasis on aspects of entrepreneurial education), hampered access to finance, obstacles to transfer of ownership, major "penalties" for business failure and restrictive administration.

Leaskova (2014) states that the main factors determining the future success of SMEs in the new world of globalization are networking, the implementation of new information and communication technologies, the development of innovation, and the implementation of strategic small business management. The problem of dynamic competitiveness as a way to find new customers should definitely include new forms of strategic alliances (i.e. clusters), which require the development of new business models. Kunkongkaphan (2014) points out that SME clusters have proven effective in increasing the level of enterprise productivity and the level of penetration in the international market.

Given their importance to the European economy, in 2017 the EU launched a debate on the future of European SMEs. The report of the Association of Crafts and SMEs in Europe (2019) points to the need to make progress in three key areas: (1) Better conditions for growth and job creation; (2) Improving the conditions of business on the Internal European Market; and (3) Achieving a stable social and political environment. In the context of achieving these priorities, the EU should become attractive for foreign investment, create the conditions for a fair distribution of the positive effects of globalization and technology development, maintain and enhance the openness and fairness of the Internal Market and the functionality of economic governance, while maintaining the stability of the euro area.

6. Conclusion

The entire global economy, including the EU economy, has been facing a continuous and dynamic process of globalization in recent decades. Which, with its positive and negative effects, has greatly changed the ways of doing business and achieving international competitiveness. In addition, modern economic developments have had significant effects on European SMEs, which, because of their importance for European economic growth and because of their significant share of total employment, are a major driver of the EU economy. The analysis indicates an increase in the total number of SMEs, an increase in employment in active enterprises, and an increase in output. Improvements in value added and productivity growth have also been identified. These values can also be linked to the growing focus of European SMEs on R&D investment and its outputs; a key way to gain international recognition. The perspectives of European SMEs is largely linked to a further orientation towards the elements of a knowledge economy and enhanced cooperation through various forms of association and merger. This determines the basic scientific contribution of the paper. The research detects that the European companies' lag behind in innovative activities relative to their main competitors, which is a key challenge for EU development strategies. Further research should focus on quantitative analysis of the effects of globalization trends and innovative activities on improving the performances of European SMEs.

POSSIBLE GUIDELINES FOR ENHANCE ENTREPRENEURIAL ECOSYSTEM

ABSTRACT

New practices and tools to address integration processes with entrepreneurship movements in universities are needed. As natural partners in developed countries, universities and society seek to work together in order to complement their knowledge, human resources and R&D laboratories, among others. Nowadays, creating solutions requires sources of creativity beyond the companies' boundaries, involving cooperation with customers, suppliers, research institutes and even competing companies. This co creation demands greats dynamics, being universities the preferred partners in new technological fields where business results are uncertain and knowledge are crucial. However, even if enterprises with strong dynamic capabilities are intensely entrepreneurial, they not only adapt to business ecosystems, but also shape them through innovation and through collaboration with other enterprises, entities, and institutions. Entrepreneurial ecosystem refers to the environment that affects the local/regional entrepreneurship, such as culture, policies, cooperation, networks, and others. Porto University (U.Porto) offers a great example for studying this theme, as it is a reference unit for management and a source of value creation to the university and start-up companies originated from it. This study aims to explain and share best practices in U.Porto and try to understand how can some of them be exported to other Higher Education Institutions, namely to the Polytechnic Institute of Cávado and Ave (IPCA). Using primary data and interviews with responsible from the city of Porto, the results could be practical guidelines for potential implementation as well as replications on IPCA Schools, in Portugal and elsewhere.

Key words*: co-creation, entrepreneurship, innovation, entrepreneurial ecosystem, U. Porto.*

1. Introduction

The main role of entrepreneurship while trigger of economic growth can be easier if supported by coordinated entrepreneurial ecosystems (Mason & Brown, 2014; Isenberg & Onyemah, 2016) that can be used as sets of entrepreneurial actors, entrepreneurial organizations, institutional and entrepreneurial processes who connect, mediate and manage performance within the local business environment (Isenberg, 2011). This means, among others, links between entrepreneurs, educators, corporations and media (Bloom & Dees,

2008; Wessner, 2005) who develop academic skills and competences to what concerns entrepreneurship (Isenberg, 2011). Inside the entrepreneurial ecosystem it can be pointed out the Human Capital, funding supports, Mentoring and coaching, Government, regulations, education and training, cultural supports and leadership (WEF, 2013; Feld, 2012; Isenberg, 2010). Also academies are relevant as education helps to develop entrepreneurial intentions among the community (Honig, 2004) and community helps academy to identify problems/opportunities that need solutions and must be grasped (Spilling, 1996; Neck, Manz, and Godwin, 1999). This study aims to explain and share best practices in Porto University (U.Porto), Portugal and try to understand how can some of them be exported to other Higher Education Institutions, namely to the Polytechnic Institute of Cávado and Ave (IPCA), Portugal. Using primary data and interviews with responsible from the city of Porto, the results could be practical guidelines for potential implementation as well as replications on IPCA Schools, in Portugal and elsewhere.

2. Entrepreneurial Ecosystems on Universities

An ecosystem consists of a biological community, its physical and chemical environment, and the dynamic interactions that link them. Ecosystems can also be thought of as energy transformers and nutrient processors. A diversity of ecosystems exists throughout the world and can be classified according to their functional groups and physical context. Insights into the structure and function of entire ecosystems can be revealed through whole ecosystem experiments, management experiments, and natural stable isotope analysis (Salomon, 2008). Ecosystems appear to develop within geographical areas that are defined for the proximity of the participants. A region needs tangible assets (working capital, risk, IR&D, technology commercialization, Human Capital, physical infrastructure, industrial base), intangible assets (network opportunities, culture, community attitudes) and business climate assets (government policies, quality of life). But they do not arise anywhere, as an established knowledge base is needed and a considerable number of scientists and engineers. In this sense, universities, Research Institutes and Laboratories are responsible for fostering the ecosystem, where discoveries and advances in knowledge form the basis for the creation of new business, maintaining the creation of spin-offs as a cyclical process (Mason & Brown, 2014).

Universities have an important role inside the ecosystem as they are the catalysts for technological innovation (Bramwell, Hepburn & Wolfe, 2012) and are able to attract financial resources, Humans resources and knowledge from other places. Isenberg (2011) suggests that universities must belong to an entrepreneurial strategic ecosystem (universities, public organizations, companies, business angels, Banks and others) where all players must be connected, aiming to promote the local development as this innovative interactive model reinforces the knowledge and technology transfers (Etzkowitz & Leydesdorff, 1998) as well as fulfils their role as protagonist in the development of society, dealing with societal, environmental and economical development. Universities must move from their traditional teaching role to entrepreneurial universities (Peppler, 2013). Universities must be vibrant ecosystems of entrepreneurship (De Jaeger, Mithembu, Ngowi, & Chipunza, 2017), characterized by the breadth and depth of offering initiatives in three major dimensions: academic entrepreneurship, company support and entrepreneur behavior (Peppler, 2013).

3. Empirical Evidence and Results

3.1. Methodology

The study was carried out during 2019 and the main *focus* was the Universidade of Porto (U.Porto), Portugal. This research is a case study, were semi structured interviews were used

to allow interviewers to have more freedom to answer in accordance to their own experiences concerning academic degree and knowledge about the present topic (Marconi & Lakatos, 2017). The collected data included secondary data from scientific publications and materials from the city of Porto. The primary data were directly collected on UP, through its internal and external players linked to entrepreneurial education, namely management, professors, instructors, students, specialists or entrepreneurs. The interviews (ten) were conducted between May and October 2019.

The starting point of this investigation was: "Does UP really positively impact the Entrepreneurial ecosystem in Porto region?". In addition to the research question, it was essential to outline general and specific objectives. The present study has as main objective to share knowledge about the social and economic value of U.Porto. It starts by presenting a brief history since its foundation on the XVIII century until now as well as communicate its positioning and strategy for the medium and long term. With the general objectives it intends to identify U.Porto:
• Structure, Human Resources skills and educational quality standards;
• Close connection with national and international scientific research, local businesses, cultural and arts institutions, as well as museums, and the two central city hospitals.

With the specific objectives it is additionally intended to identify U.Porto:
• Focus on areas that will reap more social benefits and economic externalities;
• Strategic initiatives to promote culture innovation, particularly through the structure of UPIN;
• Dynamics business incubators on UPTEC;
• Focus on maintaining leadership in the field of valuing knowledge in Portugal and strengthening its positioning and prestige within the international scenario;
• Internal development.

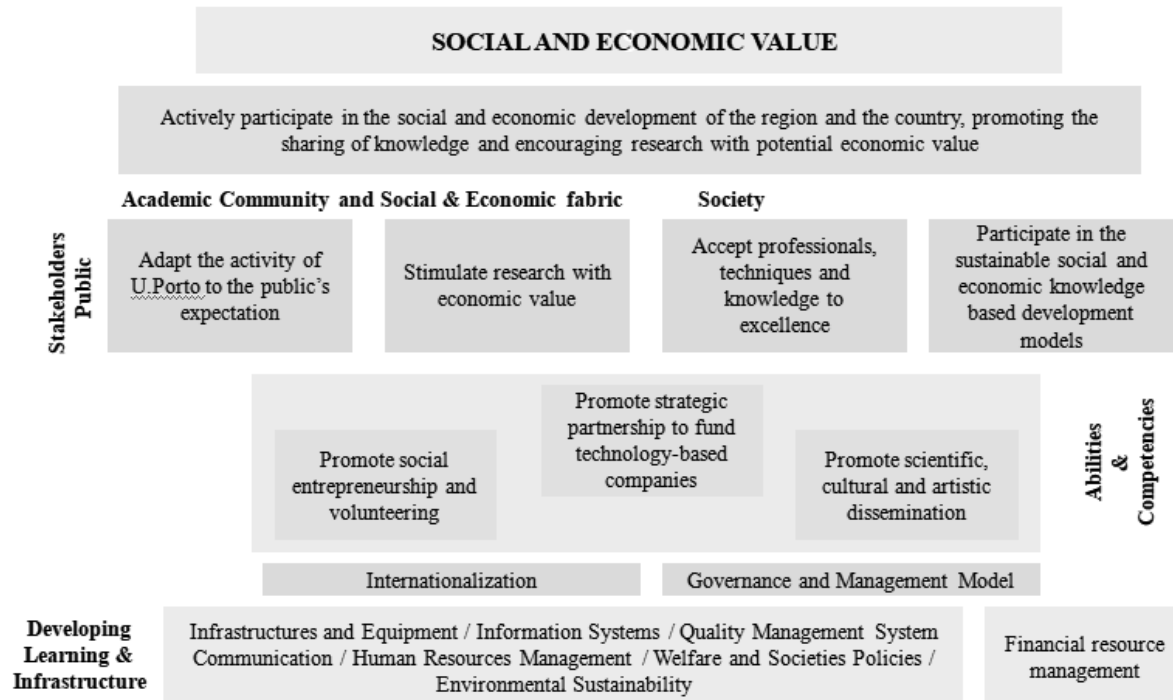
3.2. Data Collection

3.2.1. Framework

The University of Porto (U.Porto) was founded on the XVIII century, being the biggest institution of teaching and researching in Portugal. It is located on Porto, the second town on Portugal, in 3 different Poles (Town center, Asprela and Campo Alegre), gathering 31.000 students, 2.300 professor and researchers. It gathers 14 Faculties, 1 Business School, 1 Entrepreneurial Center, 69 Research Units and Competitions and Business Plans. Its main areas of acting are: Architecture, Arts, Law, Health Sciences, Management, Engineering, Education and Business, among other (U.Porto, 2019). The University's Human Resources also include highly qualified administrative and technical officers, who are responsible for maintaining the institution fully operational and, to a fair extent, successful. The quality of U.Porto's teaching is strengthened by a close connection to scientific research, local businesses, cultural and arts institutions, as well as museums, and the two central city hospitals.

The increase in quality, of both the R&D+i activities, by promoting the integration of findings in the social and economic fabric, and training activities, by promoting qualification and employability, inevitably leads to creating value in society. The U.Porto intends to continue to actively participate in the sustainable development of nations, satisfying the most demanding expectations of its public, primarily investing in the development of integrated partnerships with institutions that share the same strategic vision: the development of added value activities with strong international orientation and visibility. The University will

continue to focus on stimulating economically valuable research, emphasising the areas that will reap more social benefits and economic externalities, bearing in mind their relevance for the University's target audiences. The U.Porto will therefore develop the ability to: i) promote strategic partnerships to fund technology-based or socially differentiating companies, ii) promote social entrepreneurship and volunteering work and iii) promote scientific, cultural and artistic dissemination, by stimulating a culturally and technologically wealthy society. By mastering these abilities, the U.Porto will be ready to contribute to a knowledge-based ecosystem and the stronger the University the greater its ability is to strengthen the ecosystem (U.Porto, 2011), as seen in Figure 1.

Figure 1: Social and Economic Value of U.Porto


Source: U.Porto, 2011

U.Porto also identifies as strategic the maintenance or strengthening of initiatives to promote culture innovation, particularly through the structure of U.Porto Inovação (UPIN), created in 2004, with the purpose of supporting the University's innovation value chain by fostering the transfer of knowledge and reinforcing the bond between the University and businesses. With over 15 years of experience, U.Porto Innovation focuses its activities on research at the University, entrepreneurship within the academic community and U.Porto's growing connections with industry.

The University of Porto is now a major producer of science in the country, responsible for over 23% of the Portuguese scientific articles indexed in the ISI Web of Science. Its secret lies in the daily work of some of Portugal's most productive and renowned research and development (R&D) centres, spanning the various fields of knowledge from the humanities to science and technology. Also the University of Porto is a birthplace of innovation in itself as illustrated by the Science and Technology Park of the University of Porto (UPTEC). It is a facility which today accommodates over 200 companies and 30 technology-driven innovation centres in a variety of knowledge areas. Nerve centre of the University's strategy for capitalising on knowledge, UPTEC fosters business incubation and lends its support to entrepreneurship. U.Porto develops the valorization of knowledge by managing a value chain composed of four phases, namely: i) the initial transfer of knowledge, ii) training for skills in the management area, iii) promotion of new businesses and iv) a structure for incubating

these businesses. In other words, UPIN is linked to ideas already incipient (upstream of the innovation process) and focused on intellectual property rights. UPTEC is at the end of the value chain, receiving projects already with concrete requirements. There are no boundaries that limit each of the entities, as they are responsible for boosting the entrepreneurial ecosystem within the university seen as dynamic and alive.

With a focus on maintaining leadership in the field of valuing knowledge in Portugal and strengthening its position and prestige on the international scenario, the U.Porto created, in 2018, a new consultative body, the Innovation Advisory Board made up of professionals with extensive experience in the fields of innovation and entrepreneurship, alongside a strong knowledge of university and business realities. The U.Porto patents' portfolio already has more than 180 active patents in it, being divided in 5 main areas (Figure 2).

3.2.2. Internal environment

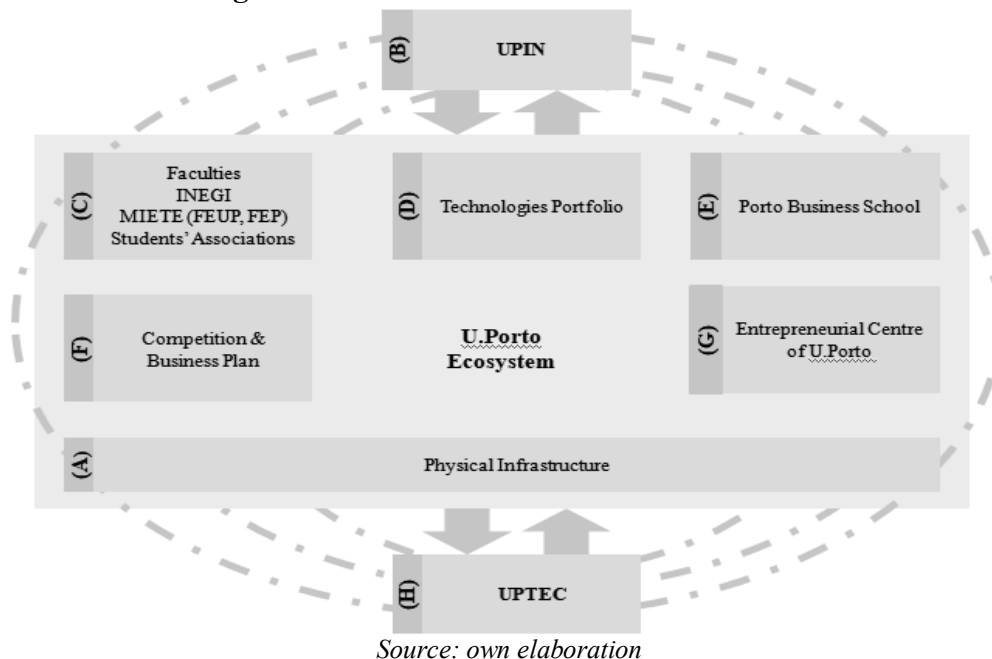
The internal environment of U.Porto that makes up the innovation entrepreneurial ecosystem are presented on Figure 3, wich is basically divided into eight large blocks as follows: (A) Physical Infrastructures, (B) UPIN, (C) Masters, Research and Technology Centres and Laboratories, Companies that have emerged from the entrepreneurial and innovative ecosystem, Business development spaces and Student´s Associations, (D) Technologies Portfolio, (E) Porto Business School, (F) Competition and Business Plan, (G) Entrepreneurial Centre of U.Porto and (H) UPTEC.

Block (A) is characterized by some of the most advanced and prestigious Portuguese research and development (R&D) units in the most knowledge domains, from Life and Health Sciences to Science Agrarian, from Engineering to Fine Arts and Humanities. The units feature a modern research infrastructure geared to the highest standards of quality with variable dimensions, purposes and organizational structures. At R&D units are integrated into organic units or interface institutes in which, in addition to the university, several public and private entities (industries, government agencies, etc.), which further enhance the connection to the community of activities R & D + i. There are still organisms that are inserted in Associated Laboratories, research units oriented towards the pursuit of scientific policy and technological change of the Portuguese Government.
The 26 Research and Development Centres are the following:

- Center for Neuroscience and Cell Biology (CNC)
- Institute of Molecular and Cellular Biology (IBMC.INEB)
- Institute of Pathology and Molecular Immunology, University of Porto (IPATIMUP)
- Institute of Chemical and Biological Technology (ITQB)
- Institute of Molecular Medicine (IMM)
- REQUIMTE - Chemistry and Technology Network - Association (REQUIMTE)
- Laboratory of Instrumentation and Experimental Particle Physics (LIP)
- Telecommunications Institute (IT)

- Laboratory of Robotics and Systems in Engineering and Science (LARSyS)
- Institute of Plasmas and Nuclear Fusion (IPFN)
- Research Center on Ceramic and Composite Materials (CICECO)
- Center for Social Studies (CES)
- Institute of Social Sciences (ICS)
- INESC Technology and Science (INESC TEC)
- Marine and Environmental Research Center (CIMAR)
- Center for Biotechnology and Fine Chemistry (CBQF)
- Center for Environmental and Sea Studies (CESAM)
- o   Dom Luís Institute (IDL)
- Separation and Reaction Processes Laboratory (LSRE)
- Institute of Systems and Computer Engineering: I&D Lisboa (INESC - Lisboa)
- Associated Laboratory of Energy, Transport and Aeronautics (LAETA)
- Institute of Biotechnology and Bioengineering (IBB)
- Nanotechnology Institute (IN)
- Institute of Nanostructures, Nanomodeling and Nanofabrication (I3N)
- ICVS / 3Bs - Associated Laboratory (ICVS / 3Bs)
- Biodiversity and Evolutionary Biology Research Network (InBIO)

Figure 3: The Internal Environment of U.Porto

Source: own elaboration


Block (B) has the purpose of supporting the University's innovation value chain by fostering the transfer of knowledge and reinforcing the bond between the University and businesses. With over 15 years of experience, UPIN Innovation focuses its activities on research at the University, entrepreneurship within the academic community and U.Porto's growing connections with industry. UPIN is formed by three main areas, namely: R&D and Innovation Support Programs; Enhancement of R&D Entrepreneurship and Business-University Interface. UPIN has an area called UPIN Ventures responsible for fostering entrepreneurship and where there are some incentive programs like Business Ignition Program (BIP), iUP25K, Startup Buzz, UPTech and Pitch me UP (UPIN UP, 2020).

Block (C) is build up with several initiatives and institutions of excellence, among which stand out:

- FARMA |inove, is an Association of Entrepreneurship and Innovation, Faculty of Pharmacy - University of Porto and is based on an entrepreneurial project with the ambition of creating new and innovative projects in the pharmaceutical area. It is based on qualified and innovative services, investing in staff training and research, innovation and development. The main purpose is to create value in a close relationship with the labour market, being itself an exporter of knowledge and technology within the Faculty of Pharmacy – University of Porto. The brand proves to be dynamic, young, innovative and willing to innovate.
- FEP JUNIOR CONSULTING is a Junior Consulting Company based at the Faculty of Economics. Made up of around 40 students, it is a non-profit association that aims to promote the personal and professional development of its members.
- INEGI is a Research and Technology Organization (RTO), bridging the University – Industry gap and focused on applied Research and Development, Innovation and Technology Transfer activities for the industry. It was founded in 1986, among what are now the Departments of Mechanical Engineering (DEMec) and of Industrial Engineering and Management (DEGI) of the Faculty of Engineering of the University of Porto (FEUP). Being a non-profit private association, recognized as of public utility and having its own team of 200 collaborators, INEGI is an active agent in the development and consolidation of a competitive model based on knowledge, on high product and process technological content and on technological innovation.
- JA Portugal is an alumni program from Junior Achievement Portugal that inspires and prepares children and young people to succeed in a global economy through transformative experiences based on three fundamental pillars: Citizenship and Financial Literacy, Education for Entrepreneurship and Skills for employability. This program is based on UPTEC but it is not developed by the U.Porto.
- MIETE is a master programme offered by FEUP (Faculty of Engineering) that promotes an integrated training of managers and entrepreneurs through a practical training (hands-on-approach). It is based on solid theoretical concepts and on a permanent and professional supervision, which enable the development of skills and knowledge in order to produce an efficient knowledge and innovation management in new businesses. These high potential new businesses may be developed in existing companies or by starting new companies.
- NEBUP is a youth association that brings together undergraduate students in Biology from the Faculty of Sciences (FCUP) and Aquatic Sciences from the Institute of Biomedical Sciences of Abel Salazar (ICBAS).
- STARTUP BUZZ is an entrepreneurship club, formed by an association of students from FEP (Faculty of Economics). It mainly helps young people with ideas of business in the embryonic phase, through a creative accompaniment using specific tools for that.

Block (D) is linked with Technologies Portfolio and as already mentioned, U.Porto has 240 active patents in five areas, namely: i) Health, Energy, ii) Environment and Construction, iii) Biotechnology and agri-food technology, iv) Information, Communication and electronic technologies and v) Transport and security. THE CIRCLE is a club formed by companies that have emerged from the entrepreneurial and innovative ecosystem of the U.Porto. Many participating companies bear the "U.Porto Spin-Off" brand, which recognizes them as having emerged from U.Porto's Research & Development and Innovation environment. It is a unique initiative that brings the U.Porto spin-offs together in forums to debate the main challenges facing companies within some of the most dynamic value chains in the world. U.Porto develops its innovation ecosystem in conjunction with these companies, streamlining the exchange of experiences and the improvement of their processes and business.

Block (E) is linked to the PORTO BUSINESS SCHOOL**,** a business school with unique characteristics. Created by a group of 36 organizations, national and multinational and by U.Porto, its mission is to prepare individuals and companies to be agents of change throughout life. This differentiating management model, which combines the pragmatism and real experience of companies with academic rigor and access to the most advanced research allow the ability to stimulate change, combining the know-how with the power to do, anticipating the future and creating the necessary skills for individuals and organizations.

Block (F) involves all competitions and business plan developed within the community. The main actions are teh following:

- A2B - Academia2Business promotes the meeting between research groups and companies with the aim of forming partnerships that ensure greater efficiency of transfer and knowledge valorisation.
- BIP is a Business Ignition Program, a business model iteration program for technologies developed in the academic environment, following the Lean methodology.
- GALA INOVAÇÃO is an event (Gala) assumed as one of the city's main innovation initiatives. The goal is to create a networking environment, which fosters the creation of synergies, capable of bringing closer the university and the business world.
- iUP25k - University of Porto Business Ideas Competition is an instrument of awareness of entrepreneurship and the creation of new companies based on knowledge and innovation exploration processes. It is one of the most important initiatives at a Portuguese level in the area of entrepreneurship, awarding 25,000 € in prizes and creating conditions for a healthy and positive competition among the best business ideas presented to the competition within the scope of the U.Porto.
- PITCH ME UP is training for a team of entrepreneurs to present the idea of business in the form of pitches, that is, a kind of qualification and training for pitches presentation.
- Start-Up is a Program where Business models are presented and validated with the market, facilitating in this way technology transfer and promoting the creation of new businesses.
- TECHNOLOGICAL INNOVATION AWARD (The Innovator of the Year Award**)** is mainly a tool for raising awareness about innovation through the acknowledgement of merit, in turn creating an example for the academic community to follow. In fact, the U.Porto has been focusing much effort in promoting invention disclosures by creating structures that encourage and support inventors/researchers, guaranteeing benefits to those who choose to communicate their inventions, such as valorisation and support during the whole commercialisation cycle resulting thereafter..

Block (G) concerns to CEDUP, an Entrepreneurship Club, created in 2007 by students willing to share knowledge and experiences and resources in the attempt to strengthen entrepreneurial actions in U.Porto. It has been responsible for the organization of several events including Innovation and Entrepreneurship Week and Promotion of "CEdUP Talks", sessions in which participants share their experiences. Its mission is to promote entrepreneurship in the U.Porto, bringing together initiatives, people and companies to create synergies and form a more valuable and efficient ecosystem. Its focus is to make the University of Porto as the main entrepreneurship ecosystem in Portugal and for that it promotes Startup Fest, iUP25k and Fluck up Nights.

Block (H) is UPTEC - Science and Technology Park of the University, a space for business development based on the skills of the U.Porto. This park is divided into four poles: Technological Pole, Creative Industries, Biotechnology Pole and Sea Pole. It fosters the creation and development of business projects in the arts, sciences and technologies, through sharing knowledge, between the university and the market. Since 2007 UPTEC already had supported 600 projects, 79 graduated companies that in 2019 directly employed 2800 high

qualified Human resources. UPTEC, in addition to offering its companies general services, also presents more advanced services aimed at consolidating Start-Ups, namely through:
- UPTEC Ace (Startup acceleration program)
- UPTEC Coach (Training and consulting to companies incubated at UPTEC)
- UPTEC Intern (Short term internship program for UP students in companies)
- UPTEC Proto (Support for new product development and rapid prototyping)
- UPTEC Inn (Partnerships and collaboration between investigation units of the U.Porto and the installed companies)
- UPTEC Buzz (Communication support service for installed companies)

3.3. Scale up Porto

With a novel and integrated vision of the scale up process, University, Local authorities, companies, citizens and other stakeholders, launched together as a first step of a coordinated program for enhancing innovation and competitiveness creating employment and improving citizens' quality of life: a strategy from Porto that commits the city towards the promotion innovation and entrepreneurship ecosystem. Together, all players are creating a sustainable entrepreneurial ecosystem where cities can work as scaleup catalysts through a program that can be reflected all across Europe.

A Scaleup Porto Manifesto has been created having as main principles Trust, City as a Central Hub, Acces to Talent, Training and knowledge share, Generating Data, Self Assessement and Benchmarking, Building Networks, City as a Lab Viving Hub and Funding. In fact in Porto's ecosystem, all the stakeholders are considered to have a unique role, contributing to innovation initiatives and policies on a relevant and peer basis. Government, regional and local authorities, entrepreneurs, educators, researchers, investors, industry and large corporations, can crate the conditions to support scale upa by working together.

Creating highly skilled and developing measures to empower job creation enhance the capacity to access to talent and fostering knowledge exchange and expert advice. Also, the implementation of a system to target, endorse, empower and report matters that concern Generating data bring more knowledge, more dynamic and more capacity to find talent.

Porto is a city of knowledge, with outstanding scientific and academic institutions and great levels of investment in research and development (R&D). In the Porto Metropolitan Area there are 72.935 higher education students (2017), distributed by the University of Porto, Polytechnic of Porto (the two public higher education institutions) and many other private universities. Portuguese scientists are developing cutting-edge research and regularly publish their findings in many of the world's most cited publications: the University of Porto alone accounts for 25% of the scientific publications produced in Portugal (2012-2016). There are 8 technology & knowledge transfer centers in Porto. The municipality government of Porto is a facilitator of innovation, turning the city into a living lab, capable of providing the right infrastructure and access to data and talent as well as funding for fast growing companies; the city is an engine of innovation, where citizens, companies, entrepreneurs and researchers work together to solve real problems.

Prominent startup supporting infrastructures (incubators, coworking spaces, etc.); In fact, there are dynamic startup communities with regular events, english is widely spoken, the National Health System ie free and the first-class private insurance affordable. Competitive talent from top-level universities, direct flight connections to all of Europe and free Wi-Fi connections available provided by the city is a reality. Only the last year, the network supported more than 1M users and 4G are available everywhere. 40% of Portuguese startups

are in Porto (around 300 startups), being 20 incubators, 30 co-working spaces and 65 R&D Centers (Metropolitan Area).

4. Analysis and Discussion

The main observed strengths at the University of Porto were the existence of a well-articulated entrepreneurial ecosystem, which includes UPIN, UPTEC, Porto Business School, the Entrepreneurship Club and research funding. Other important factors are related with the regulation on spin-offs, which aims to encourage the creation and support for innovative companies, granting them the seal of identify as linked to the U.Porto. The defined methodology to support entrepreneurs, aiming to systematize the creation process and providing a set of services for promoting the development of technology-based business projects is relevant. Business Ignition Program aims to train entrepreneurs in innovation management and business-oriented entrepreneurship. iUP25k - Business Ideas Competition from University of Porto, an instrument to raise awareness of entrepreneurship and creation of new companies based on knowledge exploration processes and innovation, which has awards in financial resources, international travel and participation in business events.

All these evidences point that he development of entrepreneurship in institutions depends on a set of connected actors and actions shared between these actors, so that conditions are created for the emergence of new ventures. The U.Porto ecosystem can be seen as an extensive set of components, internal and external to the university, and which have the potential to function as a infrastructure to support the creation of technologies and startups. The components (or actors) of the entrepreneurship ecosystem are people, companies, organizations and relevant processes for the transfer of knowledge and the creation of startups and which are object of integration and interaction efforts with the ecosystem that U.Porto develops through the mobilization of its resource and training base.

Creating highly skilled and developing measures to empower job creation enhance the capacity to access to talent and fostering knowledge exchange and expert advice. Also, the implementation of a system to target, endorse, empower and report matters that concern Generating data bring more knowledge, more dynamic and more capacity to find talent.

5. Final Reflexions and Conclusions

Research on entrepreneurship ecosystems at universities is mostly based on empirical studies and only few studies present a consolidated theory that explain the relationships between the various resources, capabilities and activities of entrepreneurship through ecosystems. This research pointed out that the role of University of Porto in relation to the increase, diffusion and intensification of activities related to entrepreneurship has a key component in the ecosystem and the knowledge transfer and new business practices. The main component of the final remarks is given by the fact that it is possible to consider in the analysis of the ecosystem a way that the plans and management models of innovation and knowledge transfer from universities must benefit from ecosystem-based visions and practices. The ecosystems of entrepreneurship are not just to indicate that there is a broader structure support for entrepreneurship actions, which goes beyond the internal limits of university. More than that, ecosystems can be used as references guidelines for the strategic management of entrepreneurship. The ecosystem is therefore, at the same time, a reference unit for the management and a source of value creation for the university and its nascent originated companies.

The search to identify and define entrepreneurial ecosystems has become a matter of great importance to identify how cities, regions and nations deal with the entrepreneurship.

However, looking at the university as an entrepreneurial ecosystem through its results are not yet generalizable but the case of the University of Porto offers insights into the types of agents, institutions, cultures and resources that an entrepreneurial ecosystem contains. In addition, it highlights governance, openness and decentralization of activities that has played a role in supporting student's founders and their high-growth endeavours. This study does not have the character of extrapolating the analysis of the environment of the U.Porto, therefore, it is suggested that further studies may analyze the external environment in which the university it is inserted, and in this way open a range for new approaches. As even if in this study a brief description of how Porto's city stakeholders strongly work with U.Porto, it would be interesting to go in deeper and find out more actions and present numbers (output in what concerns economic and social values)

IMPLEMENTATION OF VIRTUAL TECHNOLOGY IN MUSEUMS AND ART GALLERIES

ABSTRACT

The virtual technology provides new possibilities refer to creating new products in services organizations. Virtual technologies also encourage visitors to be active and more immersed and improve the availability of services. The immersive virtual reality offers opportunities to explore and recreate the past and artifacts. The technologies vary in depending on the degree of immersion and the customers have different perceptions towards particular types of virtual technologies, so it should be considered when choosing appropriate technologies. The goal of the paper is to present the results of the primary research which has been carried out at University of Dubrovnik, Department of Economics and Business refers to the students' perception towards virtual technology (VR) application. According to the results of the primary research which has been carried out in 2020., including the sample of 150 students, it is visible that students have positive attitudes towards implementation of VR technologies in museums and art galleries business practice in Dubrovnik. According to the data obtained in this study the students consider that 3D technology is the most important, but they aslo consider that other types of VR such as 2D, 4D and 5D technology should not be disregarded. According to the results of the research it is visible that 80% of students find out that virtual tecnology has high level of importance in the area of entertainment, and 50% of them think that VR/AR has high level of importance in the area of education. The students have different opinions regarding the esthetics and escapism components and they give them less importance. The same elements influence on their satisfaction with the provided service. The research indicates that curators should pay more attention to generation Z preferences in creating museums and art galleries products/services based on VR technology. As a digital generation, students expects from policy makers to rise the level of virtual tecnology involment, providing more educational and entertainment elements in their offers.

Key words: *Virtual technology, museums, art galleries, Dubrovnik, students' perception.*

1. Introduction

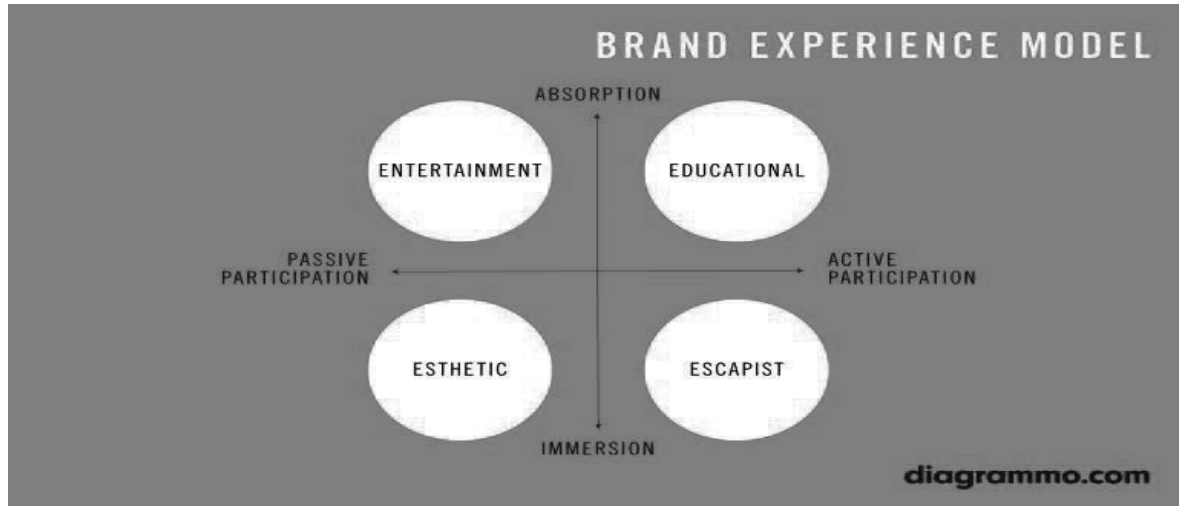
The museums and art galleries exhibits are designed to immerse the visitors, evoke emotion and inspire new thoughts. The nature of Augmented Reality (AR) and Virtual Reality (VR) provide new way in the cultural product placement. The goal of the paper is to present the results of the primary research which has been carried out at University of Dubrovnik, Department of Economics and Business. The primary research has been carried out in 2020., including the sample of 150 students. For the purpose of this paper the main hypotheses has been stated:

H1. The students have positive attitudes towards virtual technology (VR) implementation in

museums and art galleries business practice. The implementation of VR could rise the level of students' interest towards museums and art galleries cultural products.

For exploring the students' attitudes the Pine & Gilomore Model has been used. The Brand Experience Model has been presented in 1999. by Pine and Gilmore.

Picture 1: Pine & Gilmore model elements

Source: http:// www.diagramo.com


The matrix classifies experience into four domains ('4ES'). These domains are placed on a matrix divided by an active-passive involvement axis and absorption-immersion dimensions axis that together produce quadrants. The four domains are Entertainment, Educational, Esthetic, Escapist. Entertainment component refers to occupying a persons' attention agreeably. Educational component refers to the consumers' active participation through interactive engagement of one's mind or body. The consumer absorbs and increases skills and knowledge. Esthetic component refers to consumers' passive appreciation. The consumer is immersed in or surrounded by the environment. Escapist element refers to the consumer active participation in events or activities. He is immersed in an actual or virtual environment. The consumer is been active actor or participant in events or activities (Pine, Gilmore, 1999. p. 31-32**)**

2. Virtual reality- the specific features and the role in museums and art galleries

In recent years, Augmented Reality (AR), Virtual Reality (VR), and Mixed Reality (MxR) have become popular immersive reality technologies for cultural knowledge dissemination in Virtual Heritage (VH). Virtual reality (VR) is highly immersive and transports users to fully computer-generated word. From a VR perspective such characteristic enables the reimagination and reconstruction of lost cultures in a highly immersive virtual environment. Interaction in VR is always between users and virtual environments (cultural content). There is no direct interacton/relationship between users and the real word, because VR blocks users' view to physical environment. However, indirect relationship can be established via virtual environment simulations and representations of the physical world (or some elements from the physical world) in the virtual one (Bekela, Champion, 2019, p. 2-3). Definition provided by Merriam-Webster is: "Virtual reality is an artificial environment which is experienced through sensory stimuli (such as sights and sounds) provided by a computer and in which one's actions partially determine what happens in the environment" (http://www.merriamwebster.com). Augmented reality (AR) can be considered as an extension of VR, which mixes a vision from real world with virtual elements to create a real-time mixed reality. However there is not sharp

line delineating a frontier between AR and VR (Gutierrezet al., 2017., p. 473). Azuma (1997) defined AR as "a system that combines real and virtual content, provides a real-time interactive environment, and registers in 3D. So, unlike virtual reality, which creates a totally artificial environment, augmented reality uses the existing environment. The rise of AR and VR in museums has reached a significant crescendo. Museums are beginning to experiment with utilizing AR and VR to enhance the experience within the museums. VR and AR can widen public access to the museum's valuable assets by bringing these assets to life. A 3D tour can help in connecting visitors with the exhibit, assisting them to absorb the information, and reviving the display. In historical exhibitions, for instance, it can serve for communicating the reality of ancient times (http:// www. doublx.com).

Interacion between users and virtual content is a crucial element of any immersive visualization environment. The common types of interaction methods are: tangible, collaborative, device-based, sensor-based, multimodal and hybrid interaction methods. Tangible interfaces allow direct manipulation and interaction with virtual information through physical object. Collaborative interfaces often use a combination of complementary interaction methods, sensors and devices to enable and co-located and/or remote collaboration among users. Device-based interfaces use GUIs and conventional devices such as mouse, gamepad, joysick, and wand to enable interaction and manipulation of virtual content. Sensor-based interaction interfaces use sensing devices to perceive users' interaction inputs. The common types of sensors include motion trackers, gaze trackers, speech recognisers. Multimodal interfaces are fusion of two and more sensors, devices and interaction techniques that sense and understand humans' natural interaction modalities. Mulimodal interfaces are closely related to sensor-based devices. Hybrid devices integrate a range of complementary interaction interfaces to devise a method that combines different characteristics from the above categories (Bekele, Champion, 2019, p. 4).

So, one of the challenges for the companies which have been faced with AR/VR technology implementation is creating less complex and more affordable hardware, as a key factor for popularizing virtual technologies. Latest hardware developed by these companies is classified into three categories: smartphones mounted on headsets, dedicated head mounted displays and augmented reality glasses. Mobile devices like smartphones have actually processors powerful enough, to make them suitable for VR/AR visualization (Martinez-Gutierrez et al., 2017, p. 476.)

Presentation devices are the core of immersive reality. They are divided into visual, auditory and tactile presentations devices. There are five types of visual display technologies: Head-Mounted Display (HMD), Spatial Augmented Reality (SAR), Hand Held Devices (HHD), desktop screen and projection and Cave automatic Virtual Environment (CAVE). HMDs are highly immersive and commonly utilized across all immersive reality categories. Usually, HMDs made for AR and/or MxR are either video or optical see-through, whereas HMDs built for VR and/or AV experiences are blocked headsets since users' direct view to the physical environment is blocked. Spatial Augmented Reality (SAR) projects virtual information directly on the real environment through video-projectors. Two or more projectors are used for 3D effects. HHDs are portable displays such as smartphones and tablets. This group of displays have become a popular platform for mobile AR. These devices can also support VR if they are combined with additional VR kits such as Google Cardboard and RoboVR. Desktop screens and table-top projectors are common display systems for non-immersive VR and AR applications with a limited interactivity. These displays can provide 3D experiences with the addition of stereo glasses. bThe CAVE is a projection-based display technology that allows multiple co-located users to share fully immersive VR experiences. (Bekele, Champion, 2019, p.3)

Some commonly known as Pros & Cons VR technology usements arguments could be following (http://www. medium.com):

1. Pros

A) VR is being branded as an empathy machine. AR and VR both provide a greater ability to place things, events, and people within context—leading to a greater understanding. VR offers a more holistic form of storytelling.

B) VR/AR, can open up museum exhibits to people unable to attend the physical exhibit.

C) VR technologies promise more immersive museums/art galleries experience+

2. Cons

A) Museums are concerned that providing a VR experience will replace the need for a physical visits. This was a similar concern when museums were confronted with users expecting exhibits and objects to be available online. In a majority of cases online content has only served to increase interest and attendance to a physical museum.

B) The costs of AR and VR technology implementation are still high. However, there are examples of good practice, such as VIVE Arts (https://arts.vive.com/us/). It shows how museums can find a resourceful partner to explore VR museum projects.

C) The logistics of AR and VR can be daunting. Technology aside, the experience will also require space and controls set up to help museums/art galleries to keep visitors safe. The users can experience forms of nausea or anxiety, and there's also hygiene to consider when reusing equipment that is placed on people's heads.

One of the fist arts and cultural organisations that offered a VR experience was the British Museum. In 2015, it held the 'Virtual Reality Weekend', which is an event where visitors could use a Samsung Gear VR to explore a Bronze Age roundhouse and view 3D-scanned exhibit artefacts (www.grin.com). The Second Louvre Museum is an example of a traditional museum installation displaying both classic and modern works of art in a setting specifically designed to replicate a wing of the Louvre Museum in Paris. The exterior of the museum is exquisitely detailed, with colonnades, statues, fountains, and other features carefully designed and developed to evoke the grandiloquence one feels when standing in front of the Louvre in Real Life (RL).

It is undeniable that technology has a growing presence within the museum sphere and provides the opportunity for museums/art galleries to be more proactive. Virtual Reality is also motivating and has a positive influence in learning process (Mikropoulos et al. 1998). With recent advancements in visualization technologies it is possible to educate clients for using digital immersive environments that allow them to experience and experiment with a 3D/4D full-scale virtual model. Digital environment s provide an extremely rich learning atmosphere where clients gain a „sense of presence" within the virtual space. Clients learn from the virtual experiences that they have within the immersive environment. The virtual museum can also offers a number of opportunities for social interaction, including a large open-air auditorium for lectures and presentations, small conference areas, and plenty of places for groups to gather and discuss the museum's exhibits (Urban et al., 2007).

According to the Bekele & Champion (2019) specific integration of collaborative and multimodal interaction methods into a Mixed Reality (MxR) scenario that can be applied to VH applications that aim at enhancing cultural learning. The different categories of immersive reality (AR, VR, MxR) and their enabling technologies have to be taken into the account. The different immersive reality categories have potential to establish a contextual relationship between users, reality and virtuality and enable collaboration and engagement in virtual environment. Different interaction methods such as tangible, collaborative, multimodal, sensor-based, device-based and hybrid inerfaces provide different approaches from experiential and technological requirements perspective. For instance, they have proposed a specific combination of MxR and a hybrid interaction method comprising collaborative and multimodal

features in order to enhance cultural learning at heritage sites and museums (Bekele, Champion, 2019, 12).

Discover Babylon is a research and development project involving UCLA's Cuneiform Digital Library Initiative (CDLI), the Federation of American Scientists (FAS) and the Walters Art Museum (WAM). It focuses on how new information technologies (and game technology in particular) can enable key recommendations of modern learning science and bring new life, meaning, and excitement to museum and library collections. Synthetic learning environments allow visitors to see the objects used in context, manipulate them, and ask questions about them from characters in the game. Games offer an exploratory environment in which learners can engage in experiential, active, problem-based learning, receive immediate feedback, and create their own pathways to knowledge. Collections can be virtually reassembled to create a richer appreciation of a single artifact or a deeper understanding of a whole culture. The project emphasizes technology-enhanced learning experiences that encourage intergenerational dialogues by groups of museum audiences and that reach non-traditional museum visitors. It does this with a process that carefully integrates development and evaluation of new learning system. The project is creating an immersive learning game that is designed to teach players about the cultural legacy of ancient Mesopotamia. In producing the game project also creates: synthetic environments that can be decoupled from the game challenges, scans of museum objects and tablets, historically attested character models (avatars), learning challenges suitable for use in a classroom, a script, a question and answer database, photographs of objects taken by the project staff, cinematic clips that appear within the game, and two versions of the game (Lucey-Roper, 2006).

Virtual reality technologies are also used to help in teaching complicated skills and digitally preserving intangible heritage. The Department of Management Information Systems, Central Taiwan University of Science and Technology of Taichung, has realized an interesting the project. The main goal was „to preserve ancestor's wisdom in addition to artefacts". After the passive introduction, the 3D environment becomes more interactive and users are allowed to select some hotspots triggering various events, like visualization of documents and activation of other interactive sections. The users are free to explore the virtual environment and choose the contnt they want to deepen. This allows users to customize their own experience and examine for instance only the technical material (Carrozzino et al., 2011).

The National Museum of Singapore is currently running an immersive installation called Story of the Forest. The exhibition focuses on 69 images from the William Farquhar Collection of Natural History Drawings. These have been turned into three-dimensional animations that visitors can interact with. Visitors download an app and can then use the camera on their phone or tablet to explore the paintings. The installation provide a learning experience. The visitors can hunt for and 'catch' items. They can add them to their own virtual collection as they can walk around the museum. Users can learn facts such as how rare the species are (www.museumnext.com). The use of virtual technology has become a solution to improve the communication between cultural services providers and visitors.

3. The results of the empirical research which has been carried out in Dubrovnik

3.1. Methodology of the research

The empirical reseach has been carried out in 2020., including the sample of 150 students. Besides the Croatian who are studying at University of Dubrovnik the Erasmus + Mobility Program students have also been included in the research. For exploring the students' perception of an virtual technologies use in museums and art galleries the Likert scale and Pine & Gilmore model have been used. Using the method of semi-structured interview the students'

perception towards virtual technology (VR) application in Dubrovnik museums and art galleries business practice has been explored. The descriptive statistic has been used for analysing the dana.

3.2. Results of the research

In the next text the results of the empirical research refer to students perception towards virtual technology have been provided.

Table 1: The importance of the virtual technology

Virtual technology / Organisations	Very important	Important	Neither important nor unimportant	Has small importance	It is not important
Museums	10%	60%	30%	-	-
Art galleries	10%	30%	60%	-	-

Source: authors

According to the result of the research carried out at University of Dubrovnik, it is visible that the largest number of respondents (70%) consider that virtual technology is important and very important and 30% think it is neither important, nor unimportant. The situation is different in case of the art galleries. The most of students (60%)consider that the virtual tecnology is neither important, nor unimportant for art galleries business practice and 40% of them think that it is important and very important.

Table 2: Students' interest in virtual technology in culture

Interest / Technology	High	Middle	Little	Do not have at all
Without VR	-	62%	38%	-
With VR	35%	55%	10%	

Source: authors

According to the data obtained in this study for the majority of respondents (80%) consider that 3D technology is important and very important, 75% think that 2D is important and very important, 70% find out that 4D is important and very important and 50% of them think that 5D is important and very important. The significant number of respondents, 20% in each category consider VR technologies neither important, nor unimportant, 5% think that 2D has small importanace, 10% consider that 4D has small importance and 15% of students think that 5D technology has small importance in museums/art galleries business practice. The share of 15% of students aslo find out that 5D tecnology is not important at all.

Table 3: Importance of each type of the virtual technology

Importance / Type of technology	Very important	Important	Neither important nor unimportant	Has small importance	It is not important
2D	20%	55%	20%	5%	-
3D	20%	60%	20%	-	-
4D	25%	45%	20%	10%	-
5D	25%	25%	20%	15%	15%

Source: authors

Table 4: The importance of VR technology usement according to the Pine & Gilmore model- 4E

Importance / Elements	High	Middle	Small	Not important
Entertainment	83%	17%	-	-
Education	50%	25%	25%	-
Esthetics	42%	48%	10%	-
Escapism	45%	30%	25%	-

Source: authors

According to the results of the primary research 83% of students find out that virtual tecnology has high importance in the area of entertainment, while 17% think that it has middle level of importance. The share of 50% consider that virtual technology has high importance in the area of education, 25% think it has middle importance and 25% consider it has small importance. The students have aslo different opinions refer to the esthetics, so 48% think that VR technology has middle level of importance, 42% think hat it has high level of importance and 10% consider that VR technology has small importance in the area of esthetics.

Table 5: The influence of VR technology on students' satisfaction

Influence / Element	High	Middle	Low	There is no influence
Entertainment	85%	15%	-	-
Education	85%	15%	-	-
Esthetics	32%	58%	10%	-
Escapism	42%	58%		-

Source: authors

According to the data via table 5. it is evident that 85 % of respondents consider that VR technology has high level of influence on students' satisfaction with educational and entertainment component. The share of 15% consider that VR technologies development in the area of entertainment and education has middle level of influence on their satisfaction with visits. The students have different opinions towards VR technology influence on their satisfaction with the museums/art galleries products in the area of esthetics and escapism. The sahre of 58% of them think that VR technology has middle influence, 32% consider that VR has high influence and 10% of them think that VR has small influence in the area of esthetisc. Very similar situation is with the escapism, so 58% of them consider that VR tecnologies have middle level of influence and 42% think that the VR technology has high level of influence on their satisfaction with museums and art galleries products.

 The students have stated   the main advantages and disadvantages of VR technology implementation in museums/art galleries business practice. Acording to the students' opinions the main advantages of VR technology implementation are: the education refers to artifacts is very interesting, there is a possibility to „alive" the past time, the interaction is better, the exhibits cana be seen without physical visits, it encourages the young people to visit museums/art galleries. The students have stated some disadvantages and the main of them according to the students' opinion are: costs, the lack of informatic knowledge, access to VR, adaptation of musemus/art galleries to AR/VR reality.

4. Conclusion

Museums and art galleries have always been quite traditional, however, there is a need and challenge for making there buisnes practice more proactive. Works that lie in the darkness of

archives and storage rooms because of lack of available display space can finally see the digital light of day. Curators should not be limited by space, distance, transportation cost, mobility or robustness of the pieces (www.doublx.com). Displaying unique types of collections may be physically impossible to display in real life (Urban et al. 2007). The virtual tehnology (VR) could help the museums/art galleries in creating and implementing user-centered digital programs and improving visitors satisfaction. It offers immersion and connection, and can stongly affect people's emotions (Stuart, 2019, 1). It provides extraordinary possibilities to facilitate and enrich the experiences of visitors. The immersive virtual reality offers opportunities to explore and recreate the past and artifacts. Both AR and VR have their benefits and offer different types of engagement experiences. VR's strength is embodiment and immersion. So visitors are able to be inside the time or place and understand different viewpoints such as to be engage in interactions rather than just observe in a traditional setting. AR is slightly different in that it can overlay information, people and objects on the physical space. Utilizing AR in museums means that digital experiences can become context-aware based. So, it's important for a museums/art galleries curators to understand these technologies such as to cooperate with VR technology experts in order to esure the appropriate implementation and overcome possible barriers in the process of identifying and adopting new solutions.

According to the results of the research wich has been carried out in Dubrovnik it is visible than students are very interested in VR technology implementation. According to the data obtained in this study the students mostly consider 3D technology as the most important, but they aslo consider that other types of VR such as 2D, 4D and 5D technologies should not be disregarded. The results of the research show than 80% of students find out that virtual technology has high level of importance in the area of entertainment, and 50% think that VR and AR technologies have high level of importance in the area of education. The students have different opinions regarding the esthetics and escapism components and they give them less importance. The same elements influence on their satisfaction with the provided service. Many museums/art galleris aiming to achieve higher overall satisfaction do not distinguish the different aspects of visitors' experience and believe that every aspect is equally important. So, the curators should take into the account that museums/art galleries cultural offer for sudents and other young peope should be based in the first order on edutainment elements, because the students have given high level of importance to both components. According to the results oft he research students prefer to be immersed in cultural offer and to be active.

MAPPING LITERATURE REVIEW ON THE ROLE OF CONSCIOUSNESS IN ENTREPRENEURSHIP COMPETENCE DEVELOPMENT

ABSTRACT

One of the key policy objectives for the European Union is the development of the entrepreneurial capacity of European citizens and organisations. The Entrepreneurship Competences Framework (EntreComp) set in 2016, emphasizes entrepreneurship as a transversal competence, which applies to all spheres of life. Although the framework aims to foster entrepreneurial learning it does not lay down specific methods of entrepreneurship competencies development and remains an open invitation to be used in formal and non-formal education. Accordingly, in different fields of science, there is increasing interest in research on human consciousness as a personal transformation element. However, research has been fragmented and remained closed within boundaries of the certain scientific area. In order to enable further development of the research area, the purpose of this study is to provide a literature review on the extant literature related to the development of the entrepreneurship competences. In particular, the study explores the previous research related to consciousness and entrepreneurship competences development. The main goal of the study is to examine patterns and main concepts in consciousness development in relation to entrepreneurship competences or education. The study uses the mapping review methodology. The sample consists of the representative number of scientific articles related to entrepreneurship and consciousness development in the multiple related and relevant domains such as neuroscience, cognitive, social, information and natural sciences and psychology. Screened articles were classified for identification of types of research, conceptual frameworks and referent disciplines. The study indicates the prevalence of theoretical, mono-disciplinary research, and the lack of empirical evidence. In addition, the study outlines the state of the academic research territory and provide a base for further conceptual and empirical research.

Keywords: *consciousness, entrepreneurship competencies, entrepreneurship education.*

1. Introduction

Entrepreneurship has been intensively studied in the past century and it gained significant recognition for its economic, social, environmental and political impact. Recently, entrepreneurship has been praised for its influence on a personal level as the way of thinking. Over the years, scientific research has been changing the focus and has illuminated the phenomena of entrepreneurship from various perspectives in order to come to a better understanding and to offer insights on specific entrepreneurship competences for implementation at a broader extent. It was, and still remains, a challenge to conceptualise and articulate entrepreneurship as a way of thinking and as a multidisciplinary approach to the process of creating economic and social value (Klein, 2006). In the past two decades, all the efforts put into entrepreneurship research seem to have come to fruition within the policy of

the European Union at least. European Union proposed 8 key competences for lifelong learning, one of which was a sense of initiative and entrepreneurship (EU, 2006). Furthermore, the EU declared that the aim of entrepreneurship education and training should be to develop entrepreneurial capacities and mindsets of people that benefit economies by fostering creativity, innovation and self-employment (European Commission, 2008). It became evident that entrepreneurial effectiveness and personal transformation represent critical elements of training programmes for entrepreneurs (Cooney, 2012)**.** Finally, in 2016 the Entrepreneurship Competences Framework (EntreComp) was announced allowing a new paradigm to emerge (Bacigalupo, et al 2016.). The EntreComp framework is the result of joint work of a heterogeneous group of experts with the common goal to help citizens to develop their ability to actively participate in society, to manage their own lives and careers and to start value-creating initiatives. Entrepreneurship is defined within EntreComp as the action upon opportunities and ideas and their transformation into value for others. Created value can be financial, cultural, or social (FFE-YE, 2012). Entrepreneurship has been declared for the first time as a transversal key competence, which applies to all spheres of life. The foundation of entrepreneurship as a transversal competence resides in personal development as a precondition for active participation in society through self-employment, job creation, and the job market entering or starting up ventures. The EntreComp conceptual model (Figure 1.) is based on the 3 competence areas, 15 competencies, 8-level progression model and a comprehensive list of 442 learning outcomes. Structured in such a way EntreComp bridges across the world of education and work.

Figure 1: The EntreComp conceptual model
Source: Bacigalupo, M., Kampylis, P., Punie, Y., Van den Brande, G. (2016.). EntreComp: The Entrepreneurship Competence Framework. Luxembourg: European Union, 2016.

In the course of this study, entrepreneurship competence is understood as a set of knowledge, skills and values that need to be acquired to foster entrepreneurial activities. Education, in general, is the process of acquisition of knowledge, skills and attitudes. In this study, the term

human consciousness is defined as the fundamental structure of a human being which ensures continuous sustainable development. Although the proposed framework aims to foster personal transformation via education and learning, it does not lay down specific methods of entrepreneurship competences development and remains an open invitation to be used in formal and non-formal education. New paradigms require new ways of education and educators able to meet contemporary challenges. Many scientific quests have been pursued on entrepreneurship education in order to find out and propose the learning methods with the most beneficial outcomes. In different fields of science, great interest is shown for research on human consciousness as a personal transformation element. So far, entrepreneurship education has not incorporated widely the consciousness concept, or explicitly consciousness development methods in the education program. One of the reasons why the concept of consciousness development is not more included and recognised by the world of entrepreneurship lies in the fact that despite many attempts, the concept of consciousness has remained insufficiently defined due to its non-physical, immaterial nature. However, new knowledge in both consciousness and education research area gives new meaning to entrepreneurship competences and argues positively in favour of the possibility to incorporate consciousness development methods into education for the development of entrepreneurship competences (Kuratko, 2005), (Béchard and Grégoire, 2007), (Sarasvathy and Venkataraman, 2011). Therefore, this study explores the relevant literature on human consciousness and relates it to existing studies on entrepreneurship competence and education with the attempt to address the question of the existence of a relationship between consciousness and entrepreneurship competences development. The main goals of the study are as follows. Firstly, to identify relevant literature in the area of human consciousness. Secondly, to detect a representative number of scientific articles related to entrepreneurship competences and consciousness development and possibly uncover the patterns and main concepts in consciousness development in relation to entrepreneurship competences or education. Thirdly, to identify existing research gaps in entrepreneurship competence and entrepreneurship education territory. Following the introduction which explains the main concepts, this study continues with an examination of the research methodology, presentation of results and ends with the conclusion and suggestions for future research.

2. Methodology - Qualitative approach

Consciousness development is a relatively new area of research examined from the multitude of scientific domains, using different conceptual frameworks and methodology. Given the relative recency of the area, importance of the research, and widening of the scope of the consciousness research, the study presents the preliminary research and deploys qualitative approach to outline the main research areas and issues.

There is a considerable amount of literature on human consciousness. For early screening and identification of relevant literature for this study, data was collected from the Web of Science database known for its ubiquity in providing access to multidisciplinary and regional citation indexes, specialist subject indexes, a patent family index and an index to scientific data sets. The Web of Science platform covers 34,385 journals, data sets of 59 million records (journals, books, and proceedings) 40.3 million patent families (> 82 million patents) 7.7 million data sets providing deep coverage in natural sciences, social sciences, and humanities (Web of Science Group, 2020). Ancillary search procedure has been used in the form of contacting the leading researcher on consciousness development methods to access the primary studies not listed on the Web of Science, The study is conducted based on the Template for a Mapping Study Protocol (EBSE-RG, 2009).

Systematic Mapping is intended to provide an overview of a research area, to take notice of the temporal trends, to identify relevant authors, the amount, the type of research and results available. For the purpose of this research following mapping questions have been set:

MQ1:   How many studies were published over the years on human consciousness?
MQ2:   In what areas of science have the studies been conducted?
MQ3:   What is a temporal trend in the number of studies?
MQ4:   What are the types of research, language, authors, institutions, and publishing journals?
MQ5:   Are the studies intersected and interrelated with studies on entrepreneurship competences and entrepreneurship education and how?

Published studies have been selected as per the following inclusion criteria: papers focusing on human consciousness, consciousness development, entrepreneurship competences and entrepreneurship education published up to January 2020. Grey literature, such as produced outside of traditional academic publishing channels, has been excluded, because of the non-transparency of their review process. Also, studies which are not connected to human consciousness have been excluded as well as those where consciousness development was used as a synonym for raising awareness or sensibility for something. The steps described in Figure 2 have been followed for the process of identification, extraction and selection of relevant literature.

Figure 2: The Search Protocol

Identification
- By Web of Science platform
- By keyword consciousness
- By titles, abstracts, author and keywords examination
- By the year, language and research area

Refinement
- By title and research domain
- By author, publishing journal, institution and relevance
- By additional keywords entrepreneurship competence and entrepreneurship education

Eligibility
- Full text studies assessed for eligibilty (584)
- Verification
- Eligible (584)

Source: Author

All database searches per topic on the keyword consciousness* were conducted in the first phase (MQ1). The asterisk symbol (*) at the end of the keywords is search criteria set by the search engine which broadens a search by finding words that start with the same letters. The search engine examined titles, abstracts, author and keywords. The collected records have been sorted by year, language and research area (MQ2, MQ3). In the second phase, the database was examined by title and research domain and afterwards by author, publishing journal, institution and relevance (MQ4). The keyword consciousness* was further combined with additional keywords entrepreneurship competence* and entrepreneurship education (MQ5).

3. Results

Initial search for relevant literature has been conducted according to the keywords: "consciousness*", "entrepreneurship competence*" and "entrepreneurship education" and it resulted in a total of 128523 records on consciousness, 1414 on entrepreneurship competences and 8875 on entrepreneurship education. The resulting records were derived from the search of all types of publications: articles, proceedings paper, reviews, books, book reviews, and chapters. The publications cover the period from the earliest record available in 1800 until 2020.

3.1. Development of Consciousness Studies

At the first level search for consciousness-related records of publications containing the word consciousness on all databases under the Web of Science platform, it was found that the first records have been made in 1800. It is known that the first documented pieces of evidence of reflection upon consciousness by Aristotle are dated 350 BC. The Web of Science records covers the timeline from 1800 until 2020. A significant number of records of publications started to grow as of the 1950s and reached a peak of 8927 records in the year 2017 solely (Figure 3).

Figure 3: Consciousness Publication Records per Year
Source: Author

The records of consciousness studies show continuous growth. Cumulated from 1946 until 1980, covering four decades, there were 6403 records in total. Afterwards, only in one decade, during the1980s, the number of records reached 7489. The significant increase in records on consciousness studies has been noticed especially as of the 1990s. In the decade of 2010s, it has grown almost ten times compared to the 1980s as shown in Table 1. The distribution per type of publications is as follows: articles 107514 (83.65%), reviews 13803 (10.74%), and smaller fractions of other and unspecified types of publications.

Table 1: Growth in Consciousness Records

Decade	Number of Records	Growth Index
1980s	7489	100
1990s	12571	168
2000s	28358	379
2010s	73221	978

Source: Author

Sorted by language, the most of publications related to consciousness were in English 87013 (67.70%) followed by Korean 18328 (14.26%), Russian 6774 (5.27%), German 3252 (2.53%), Spanish 3114 (2.42%), Japanese 2886 (2.25%), French 2472 (1.92%), Portuguese 1253 (0.97%), Chinese 1170 (0.91%), Italian 793 (0.62%) and smaller fractions of other languages.

Predominant scientific areas in consciousness research are Neurosciences Neurology 37190 (28.93%), Psychology 32119 (24.99), Behavioural Sciences 30226 (23.52%), Philosophy 10132 (7.88%), Social Sciences Other Topics 8910 (6.93%), Science Technology Other Topics 7111 (5.53%), Sociology 6657 (5.18%), Biochemistry Molecular Biology 6637 (5.16%), Education Educational Research 6414 (4.99%) and smaller portions of other areas. Business and Economics research area is represented in 4436 (3.45%) publications (Figure 4).

Figure 4: Consciousness Publication Records per Research Area
Source: Author

3.2. Consciousness in Social Studies

Since a large number of studies were extracted by the search, the idea was to combine the results of the search for predominant scientific areas of consciousness, entrepreneurship competence and entrepreneurship education to determine an optimal common research area. The data has been examined by the keywords "consciousness*", "entrepreneurship competence*" and "entrepreneurship education". The result has been analysed according to the research area. It can be concluded that studies on consciousness are predominantly related to the research area of neuroscience, none of them is related to entrepreneurship competence and

entrepreneurship education and vice versa. Only in sociology and social sciences are they relatively equally represented as shown in Figure 5. Therefore more focus has been given to studies in social sciences for possible detection of interdisciplinary studies apart from neurosciences.

Figure 5: Relative Representation of the Records by Keywords in Research Areas
Source: Author

The search query based on the keyword "consciousness*" in titles of articles in social sciences resulted in 35948 records which are distributed in research fields predominantly in Psychology 5814 (16,17%), Behavioural Sciences 4738 (13,18%), Neurosciences Neurology 3238 (9,01%), Social Sciences Other Topics 1540 (4,28%), Sociology 1342 (3,73%), Education, Educational Research 975 (2,71%), Philosophy 772 (2,15%) and smaller fractions in other fields. Out of the total number of records altogether 14546 are published under Social Science domain, out of which 10393 are articles. The articles have been published in 4220 journals. The abbreviated list of relevant journals, with 25 and more records, is given in Table 2. covering only 2428 (23,36%) articles of selected domain. This result indicates great fragmentation and a wide dispersion of existing knowledge.

Table 2: The Top Journals Containing Consciousness Studies

Rank	Source Titles	Records	% of 2428
1	Journal Of Consciousness Studies	288	11,86%

Source: Web of Science

In the next phase of the quest, the data has been searched by keywords "consciousness*", "entrepreneurship competence*" and "entrepreneurship education", refined by the type of publication (article), and resulted with only 1 record, suggesting that this area is unexplored since there is no evidence of synthesised research. The result also leads to a conclusion of the evident lack of synthesis in this specific research field.

3.3. The Most Relevant Consciousness Articles

The most relevant articles were selected through the process of verification of eligibility of 584 of the most cited articles recorded in the previous stage of consciousness search. The articles were further sorted per type of research. The abbreviated list of the first 25 examined articles ranked by citation count is available in Table 3.

As per research area, 44% of listed articles are dedicated to Psychology, 32% to Neuroscience, 12% to Behavioural Science, 8% to Psychiatry and 4% to Cognitive. Graphical presentation of the summarised result is represented in Figure 6. Of the total number of verified studies, 57% (333) refer to theoretical studies, 12% (71) to conceptual, 15% (89) to methodological and 16% (91) to empirical studies. The result of the predominance of theoretical articles does not come as a surprise. According to the evidence of this study, there is no consensus on the definition of consciousness, despite an intensive scientific search. The lack of definition can also be the reason for the high dispersion of the studies.

4. Discussion – Intersection and Interrelation of Consciousness and Entrepreneurship Competencies

Present literature on consciousness uses the term "consciousness" in different contexts and meaning. The term "consciousness" is used in literature as a synonym for "mind", for the phenomenology of everyday conscious experience, "self-consciousness", "wakefulness", "knowledge" or "cognition", "attention" and "awareness". With the emergence of information processing theory and information integration which is based on the premise that humans process the information they receive, rather than merely responding to stimuli, consciousness can be viewed as the complex structure responsible for the arrangement of and relations between elements of something rather even more complex.

This study outlined the prevalence of mono-disciplinary and predominantly conceptual research. The multiple intersections between consciousness functions and entrepreneurship competencies have been nominated. Screened articles have been classified for identification of types of the research, conceptual frameworks and referent disciplines. Contemporary

interdisciplinary research discoveries especially in cognitive psychology, neuropsychology, brain imaging, quantum mechanics, quantum biology and biophysics are moving our understanding of consciousness away from its simplified interpretation as the synonym for brain function (Dehaene and Naccache, 2001). The mapped literature provides evidence that consciousness possesses the ability to shift random physical systems out of randomness. Ultimately this indicates that our beliefs, thoughts, and intentions affect the physical world through the prism of consciousness as well. Modern science provides more evidence of consciousness as a fundamental structure of human being and the world. Grabovoi, (1998) considers the development of consciousness as an urgent and high priority task of humanity to be able to control, normalise and harmonise all events on a personal and global level. Structuring of human consciousness ensures infinite development and allow human beings to live in any circumstance. Such considerations are in line and support sustainable development goals (UN, 2015). Apostolopoulos et al (2018) indicate that entrepreneurship can be the engine for transforming our world and overcoming the diverse nature of global challenges and emphasize entrepreneurship role in leading and driving the development and transformation of the world. No matter how big or small business it turns to be, everything starts from one bright thought, one idea born in a single mind of a person with an entrepreneurial spirit. Therefore, what is next going to be in entrepreneurship and world development will depend on the quality and the structure of the consciousness and mind of a human being.

Based on the literature mapping six main streams of the consciousness functions have been nominated to determine the importance of consciousness research on the further development of the entrepreneurship behaviour or entrepreneurship competences. Van Gulick (2018) summarises previous research on consciousness in terms of consciousness functions. These are flexible control, social coordination, integrated representation, informational access, freedom of will and intrinsic motivation. In the schematic presentation of Table 4. Each of these functions is qualitatively assessed from the perspective of their importance and possible intersection and relationship with specific entrepreneurship competence. As per Van Gulick (2018), the consciousness has the function of highly flexible and adaptive forms of control when dealing with novel situations and previously encountered problems or demands (Anderson 1983, Penfield 1975, Armstrong 1981), in skill acquisition and during the initial learning phase (Schneider and Shiffrin, 1977), in the compilation of activities and control over execution (Anderson, 1983) which coincide with entrepreneurship competencies of coping with ambiguity, uncertainty and risk-taking initiative and learning trough experience. Consciousness has enhanced capacity for social coordination which is important in enhanced understanding of the mental states of others (Humphreys, 1982), in the formation of the beliefs, motives, perceptions, intentions and better awareness of both ourselves and others. This is related to the competency of working with others, self-awareness and self-efficacy. Consciousness serves for the unified and densely integrated representation of reality which is necessary in the integration of information from various sensory channels (Kant 1787, Husserl 1913, Campbell 1997) to embody its experiential organization and dynamics in the dense network of relations and interconnections that collectively constitute the meaningful structure of a world of objects and to allow more open-ended avenues of response. This function can be related to competencies of mobilising resources, financial and economic literacy and valuing ideas. Further, freedom of choice or free will determined by consciousness is relevant for opening a realm of possibilities, a sphere of options within which the conscious self might choose or act freely (Hasker, 1999). The freedom to choose one's actions and the ability to determine one's own nature and future development based on consciousness might be correlated with degrees or types of freedom and self-determination (Dennett, 1984). Competencies such as spotting opportunities, creativity and vision are related to functions of free will. Intrinsically motivating states of consciousness (Nelkin, 1989; Rosenthal, 1991) are reflected in the competencies such as motivation and perseverance and mobilising others.

Table 4: Consciousness Functions in relation to EntreComp

Consciousness Function	Importance (Van Gulick, 2018)	Entrepreneurship Competencies based on EntreComp
Highly flexible and adaptive forms of control	When dealing with novel situations and previously unencountered problems or demands (Anderson 1983, Penfield 1975, Armstrong 1981) In skill acquisition and during initial learning phase (Schneider and Shiffrin 1977) In compilation of activities and control over execution (Anderson 1983)	Coping with ambiguity, uncertainty and risk Taking initiative Learning trough experience
Enhanced capacity for social coordination	In enhanced understanding of the mental states of others (Humphreys 1982) To be aware of both themselves and others To have beliefs, motives, perceptions and intentions	Working with others Self-awareness and self-efficacy
More unified and densely integrated representation of reality	In integration of information from various sensory channels (Kant 1787, Husserl 1913, Campbell 1997) To embody its experiential organization and dynamics in the dense network of relations and interconnections that collectively constitute the meaningful structure of a world of objects To allow more open-ended avenues of response	Mobilising resources Financial and economic literacy Valuing ideas
More global informational access	For use of information and for application to a wide range of potential situations and actions (Baars 1988). Making information conscious widens the sphere of its influence and the range of ways in which it can be used to adaptively guide or shape both inner and outer behaviour	Planning and management Ethical and sustainable thinking
Increased freedom of choice or free will	To open a realm of possibilities, a sphere of options within which the conscious self might choose or act freely (Hasker 1999) The freedom to chose one's actions and the ability to determine one's own nature and future development may admit of many interesting variations and degrees and various forms or levels of consciousness might be correlated with corresponding degrees or types of freedom and self-determination (Dennett 1984, 2003)	Spotting opportunities Creativity Vision
Intrinsically motivating states	For attractive positive motivational aspect of a pleasure (Nelkin 1989, Rosenthal 1991)	Motivation and perseverance Mobilising others

5. Conclusion

With the use of the mapping review methodology, this study aimed to map the state of academic research in the territory of consciousness concerning the development of entrepreneurship competence. It is noticed that the interest in consciousness studies, in general, is rapidly increasing. Based on the review of the most cited articles it is concluded that scientists of every research field have developed consciousness definitions and theories that suit their research interest the best and therefore there is no unambiguous explanation of the phenomenon. The lack of a unified definition and standardised use of the term "consciousness" makes this research field even more complex. Within the scope of this study, great fragmentation and a wide dispersion of existing knowledge on consciousness have been found among various disciplines. The lack of synthesis or interdisciplinary studies related to consciousness and entrepreneurship competence development has been detected. However certain patterns and relations in consciousness and entrepreneurship competence development have been found. Having in mind the main meaning and purpose of education as the process of acquisition of knowledge, skills and values and taking into account consciousness functions, this study suggests that the relationship between consciousness enhancing methods and entrepreneurship competences development might exist and can be established and evolved by education. Presented interdependence calls for more detailed research on how methods for enhancing

consciousness functions may be adopted to improve the actual entrepreneurial competence or entrepreneurship education focused on new ways of learning and teaching entrepreneurship. Since this study was limited only to the mapping of the literature, further studies will need to be undertaken for systematic literature review and empirical confirmation of the possible relationship between consciousness development methods and entrepreneurship competences improvement. Therefore this study is presented with confidence that this research will serve as a base for future studies on the implementation of consciousness enhancing methods in the development of entrepreneurship competences.

THE ROLE OF CONSCIOUSNESS IN THE ENTREPRENEURSHIP COMPETENCES DEVELOPMENT — TOWARDS EMPIRICAL RESEARCH DESIGN

ABSTRACT

Entrepreneurship has been lately defined as a transversal competence, which applies to all spheres of life. Entrepreneurial capacity development of citizens in general, not only of entrepreneurs, has become one of the key policy objectives of the European Union. Policymakers who are creating training programs have taken into account that entrepreneurship competence is developed through personal transformation. Relevant literature identifies human consciousness as personal transformation element and suggests that the relationship between consciousness and entrepreneurship competences development exists. However, conceptualization and identification of the role of consciousness and its developmental effect on entrepreneurship competence is only at the embryonic stage. Therefore, since consciousness is understood as an evolving construct, this study aims to investigate how and why it can be introduced into education to enhance entrepreneurship competences. This study is focused on the identification of appropriate research design to address these specific research questions. This study provides an overview of the appropriate research philosophies, approaches, strategies, and methods that may be useful in further exploration of consciousness and entrepreneurship education. The study indicates that appropriate research design of the relatively new and interdisciplinary phenomenon may benefit from the ontological hermeneutics philosophy. In addition, the research design should consider a pluralistic research approach and a combined methodology. It is proposed that quasi-experimental with pretest-posttest research method should be incorporated in the research design for primary data collection. Self-assessment test and individual statement are suggested to be conducted cross-sectionally. This study presents selected consciousness enhancing methods that may be used to operationalize key variables, namely consciousness development and entrepreneurship competences. The main contribution of the study is to provide a preliminary overview of the appropriate approach in empirical research design.

Key words: *entrepreneurship, entrepreneurship competences, entrepreneurship education, consciousness development, entrepreneurship self-assessment test.*

1. Introduction

Entrepreneurship has been praised for its significant economic, social, environmental and political impact and therefore has been an interesting and exciting field of study since the first notion of its concept. Various definitions and theories on entrepreneurship have been developed over the years, but the challenge of conceptualisation and articulation of entrepreneurship as a way of thinking and as a multidisciplinary approach to the process of creating economic and social value remained (Klein, 2006). Early economic theory significantly contributed to the

understanding of entrepreneurship, but somehow later it became uncomfortable territory for the research in economics due to the different and mutually exclusive philosophical assumptions about society, human behaviour and social change. Only lately entrepreneurship was defined as a transversal competence which enables people to actively participate in society, to manage their own lives and careers and to start value-creating initiatives (FFE-YE., 2012). The European Union declared that the aim of entrepreneurship education and training should be to develop entrepreneurial capacities and mindset of people that benefit economies by fostering creativity, innovation and self-employment (European Commission, 2008). Entrepreneurial effectiveness and personal transformation were set as critical elements of training programmes for entrepreneurs (Cooney, 2012). In 2016 the Entrepreneurship Competences Framework (EntreComp) was developed and launched, clarifying what the constituent elements of entrepreneurship competence are (Bacigalupo, et. al 2016.). The EntreComp conceptual model is based on the 3 competence areas 'Ideas and opportunities', 'Resources' and 'Into action', 15 competencies, 8-level progression model and a list of 442 learning outcomes. It bridges across the world of education and work. The proposed framework aims to foster personal transformation via education and learning. However, specific methods of entrepreneurship competences development have not been laid down. Therefore EntreComp stands as an open invitation to be used for further development and verification in formal and non-formal education.

The importance of entrepreneurship and entrepreneurship competence is evolving on the higher degree by the recent call for global transformation which was announced by United Nations as "The 2030 Agenda for Sustainable Development" adopted by all United Nations Member States in 2015 (UN, 2015b). The 2030 Agenda is the blueprint for peace and prosperity for people and the planet, now and in the future. At its core, there are 17 Sustainable Development Goals (SDGs), which are an urgent call for action by all countries - developed and developing - in a global partnership. Ending poverty and other deprivations must go hand-in-hand with strategies that improve health and education, reduce inequality, and spur economic growth – all while tackling climate change and working to preserve our oceans and forests. Apostolopoulos et al. (2018) indicate that entrepreneurship can be the engine for transforming our world and overcoming the diverse nature of global challenges and emphasize entrepreneurship role in leading and driving the development and transformation of the world. The quest for global transformation starts with personal transformation. Therefore, great interest in the research on human consciousness as a personal transformation element has been intensified as well. There is no evidence within scientific literature volume that explicitly consciousness concept has been incorporated significantly into entrepreneurship education. The purpose of this study is to attempt filling that void. Recent research results on consciousness and education give new meaning to entrepreneurship competences and argue in favour of an innovative education approach (Gibb, 2002; Kuratko, 2005; Béchard and Grégoire, 2005, 2007; Sarasvathy and Venkataraman, 2011). Morselli (2018) proposes that entrepreneurial education must make use of both innovative and student-centred pedagogies if it wishes to promote an entrepreneurial mindset. An innovative education approach opens the possibility to incorporate consciousness development practices into education for the development of entrepreneurship competences.

This study attempts to identify appropriate research design for the investigation of the ways how the two divergent territories like entrepreneurship and consciousness can be merged through education to foster entrepreneurship competence by personal transformation. The paper begins with the exploration of the theoretical framework and with the outline of main concepts, terms and definitions, namely entrepreneurship, entrepreneurship competences, entrepreneurship education, consciousness development and an entrepreneurship self-

assessment test. Based on definitions of relevant concepts and their detected interconnections, the further generic proposal of research design has been drafted.

2. Main Concepts, Terms and Definitions

The exploration of the role of consciousness in the development of entrepreneurship competence requires identification and clarification of the basic concepts that are a constituent part of the research subject. Based on the relevant literature review the theoretical framework is built around entrepreneurship, entrepreneurship competences, entrepreneurship education, consciousness development and an entrepreneurship self-assessment test.

2.1. Entrepreneurship

Entrepreneurship definitions have changed and evolved throughout research history. From adventure to value creation, innovation, self-employment, opportunity identification and venture creation. Lately, its social impact found the place in the definition. Kozlinska (2016, p25) defines entrepreneurship as a cumulative notion defined as a context-dependent social and economic process of discovering or creating, evaluating and exploiting novel opportunities by individuals as part of which a new firm or venture can be launched, owned, managed and/or sold, to contribute new value(s) to society, benefit the economy and an entrepreneur. In the broadest sense entrepreneurship is when you act upon opportunities and ideas and transform them into value for others. The value that is created can be financial, cultural, or social (FFE-YE, 2012). This definition is the base of EntreComp. So far in the entrepreneurship research, many aspects of the phenomena have been studied, from philosophy, theory, methodology, empirical, effects and their variations. Given the purpose of this study, it is found appropriate and important to reflect upon some philosophical views underpinning economic entrepreneurship research. The assumptions about reality, and upon position and role of the human being within the manifestation of entrepreneurship are important since initial philosophy laid down in the entrepreneurship research further dictates the course of the research, and interventions. Pittaway (2005) summarised philosophical assumptions in the economic approach to entrepreneurship as shown in Table 1. His in-depth historical review of the economic literature related to entrepreneurship discovered that entrepreneurial concept has been noticeably declined in economics due to the prevailing mutually exclusive philosophical assumptions. Pittaway (2005) concluded that both economics and entrepreneurship would gain if both interpretive and radical structuralist theoretical base is expanded. In such instance, interpretive philosophy would open economics research for the diversity of human action and its social impact, while radical structuralist could consider entrepreneurship as purposeful behaviour capable of the creation of radical change.

Table 1: Philosophical Assumptions in Economic Approaches to Entrepreneurship

	Ontological Assumptions	Epistemological Assumptions	Assumptions about Human Nature	Assumptions about Society	Paradigm
Neo-classical Economics	Reality as a concrete structure	To construct a positivist social science	Man as a responder	Social Order	Functionalist
English Classical Theories	Reality as a concrete structure	To construct a positivist social science	Man as a responder	Society as an Organic System	Functionalist

	Ontological Assumptions	Epistemological Assumptions	Assumptions about Human Nature	Assumptions about Society	Paradigm
French Classical Theories	Reality as a concrete process	To construct a positivist social science	Man as a responder	Society as an Organic System	Functionalist
Transaction Cost Economics	Reality as a concrete process	To construct a positivist social science	Man as an adapter	Society as an Organic System	Functionalist
Information-Based Transaction Cost Economics	Reality as a contextual field of information	To study systems, processes and change	Man as an information processor	Society as an Organic System	Functionalist
Calculable Uncertainty School	Reality as a concrete process	To construct a positivist social science	Man as a responder	Society as an Organic System	Functionalist
Uncertainty School	Reality as a concrete process	To study systems, processes and change	Man as a responder	Society as an Organic System	Functionalist
Austrian and Neo-Austrian Economics	Reality as a concrete process	To study systems, processes and change	Man as a responder	Society as a Morphogenic System	Functionalist
Schumpeterian Approaches and the Harvard Historical School	Reality as a contextual field of information	To map contexts	Man as an actor	Society undergoes Transformation	Functionalist with some Interpretive and Radical Structuralist elements

2.2. Entrepreneurship Competence

Within the scope of this study, the entrepreneurship competence is understood as a set of knowledge, skills and values that need to be acquired to foster entrepreneurial activities, that is, to act upon opportunities and ideas and transform them into values. EntreComp is the official framework within the European Union, which promotes entrepreneurship as a competence contributing to economic growth (Bacigalupo, et al. 2016). The framework aims to achieve consensus on terminology related to entrepreneurial skills capacity and what exactly the constituent elements of entrepreneurship competence are. EntreComp conceptual model is based on 3 interrelated and interconnected competence areas: 'Ideas and opportunities', 'Resources' and 'Into action'. Each area consists of 5 relevant competencies as shown in Table 2. Furthermore, the conceptual model is developed into the 8-level progression model. Levels are: "Discover", "Explore", "Experiment", "Dare", "Improve", "Reinforce", "Expand" and "Transform". These levels are further followed by 442 learning outcomes. EntreComp has been addressed to education policymakers and is now being implemented in the practice of entrepreneurship education in various forms.

Table 2: Entrepreneurship Competences per area

	COMPETENCE	HINT	DESCRIPTION
IDEAS & OPORTUNITIES	1.1. Spotting opportunities	Use your imagination and abilities to identify opportunities for creating value	• Identify and seize opportunities to create value by exploring the social, cultural and economic landscape • Identify needs and challenges that need to be met • Establish new connections and bring together scattered elements of the landscape to create opportunities to create value
	1.2. Creativity	Develop creative and purposeful ideas	• Develop several ideas and opportunities to create value, including better solutions to existing and new challenges • Explore and experiment with innovative approaches • Combine knowledge and resources to achieve valuable effects
	1.3. Vision	Work towards your vision of the future	• Imagine the future • Develop a vision to turn ideas into action • Visualise future scenarios to help guide effort and action
	1.4. Valuing ideas	Make the most of ideas and opportunities	• Judge what value is in social, cultural and economic terms • Recognise the potential an idea has for creating value and identify suitable ways of making the most out of it
	1.5. Ethical & sustainable thinking	Assess the consequences and impact of ideas, opportunities and actions	• Assess the consequences of ideas that bring value and the effect of entrepreneurial action on the target community, the market, society and the environment • Reflect on h w sustainable long-term social, cultural and economic goals are, and the course of action chosen • Act responsibly
RESOURCES	2.1. Self-awareness & self-efficacy	Believe in yourself and keep developing	• Reflect on your needs, aspirations and wants in the short medium and long term • Identify and assess your individual and group strengths and weaknesses • Believe in your ability to influence the course of events despite uncertainty, setbacks and temporary failures
	2.2 Motivation & perseverance	Stay focused and don't give up	• Be determined to turn ideas into action and satisfy your need to achieve • Be prepared to be patient and keep trying to achieve your long-term individual or group aims • Be resilient under pressure, adversity, and temporary failure
	2.3 Mobilising resources	Gather and manage the resources you need	• Get and manage the material, non-material and digital resources needed to turn ideas into action • Make the most of limited resources • Get and manage the competences needed at any stage, including technical, legal, tax and digital competences
	2.4 Financial & economic literacy	Develop financial and economic know-how	• Estimate the cost of turning an idea into a value-creating activity • Plan, put in place and evaluate financial decisions per time • Manage financing to ma e sure your value-creating activity can last over the long term
	2.5 Mobilising others	Inspire, enthuse and get others on board	• Inspire and enthuse relevant stakeholders • Get the support needed to achieve valuable outcomes • Demonstrate effective communication, persuasion, negotiation and leadership
INTO ACTION	3.1 Taking the initiative	Go for it	• Initiate processes that create value • Take up challenges • Act and work independently to achieve goals, stick to intentions and carry out planned tasks
	3.2 Planning & management	Prioritise, organise and follow up	• Set long-, medium- and short-term goals • Define priorities and action plan • Adapt to unforeseen changes
	3.3 Coping with uncertainty, ambiguity & risk	Make decisions dealing with uncertainty, ambiguity and risk	• Make decisions when the result of that decision is uncertain, when the information available is partial or ambiguous, or when there is a risk of unintended outcomes • Within the value-creating process, include structured ways of testing ideas and prototypes from the early stages, to reduce risks of failing • Handle fast-moving situations promptly and flexible
	3.4 Working with others	Team up, collaborate and network	• Work together and co-operate with others to develop ideas and turn them into action • Network • Solve conflicts and face up to competition positively when necessary
	3.5 Learning through experience	Learn by doing	• Use any initiative for value creation as a learning opportunity • Learn with others, including peers and mentors • Reflect and learn from both success and failure (your own and other people's)

Source: adopted from McCallum et.al. (2018)

As mentioned in the introduction, EntreComp is still an open invitation to be used for further development and verification in formal and non-formal education.

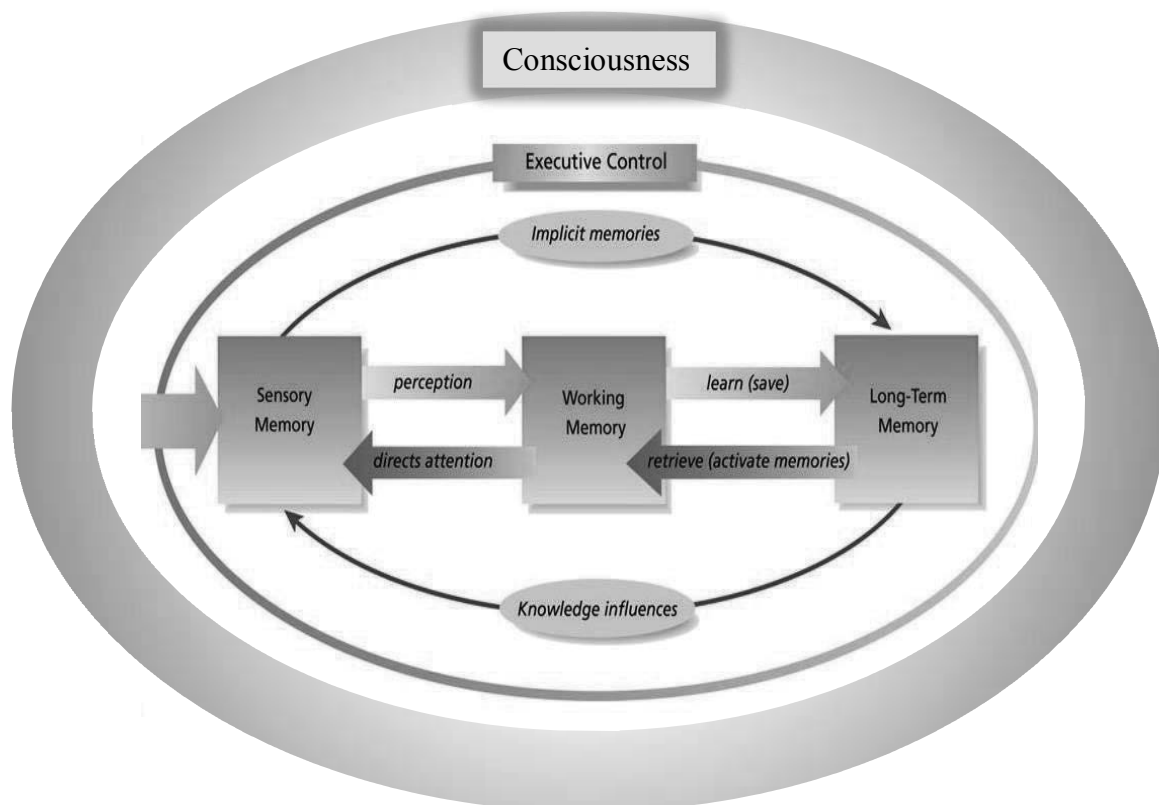
2.3. Entrepreneurship Education

Education, in general, is the process of the acquisition of knowledge, skills and attitudes. Entrepreneurship education, based on the root origin of the construct is the linkage between the world of entrepreneurship and education. Entrepreneurship education, in particular, has three main objectives and three related approaches (Hytti and O'Gorman, 2004): 1) to build an understanding of entrepreneurship and the entrepreneur and their role in economy and society ("about" approach (Gibb, 2002; Pittaway and Edwards, 2012); 2) to grow entrepreneurial capacities for active participation in value creation by taking responsibility for life and career choices ("through" approach Kyrö, 2005; Pittaway and Edwards, 2012 (Lackeus, 2015;)); 3) to become an entrepreneur and pursue a business venture, ("for" approach (Gibb, 2002; Pittaway and Edwards, 2012). Three philosophies, traditional, functional and socio-constructivist, are laid out as the basis of entrepreneurship education (Verzat, et al. 2016). There are two separate forms of education: enterprise education and entrepreneurship education (Morselli, 2018). Enterprise education is aimed to increase the abilities and skills of students to generate ideas and to put them into practice. Entrepreneurship education is focused on the development of "*further knowledge, capabilities and attributes required to start a new venture or business*". In European practise these two forms have been combined. When discussing entrepreneurship education methods, there are two categories: traditional and innovative methods Mwasalwiba (2010). Further, learning and teaching methods are differentiated by the psychology paradigms adopted in entrepreneurship education, such as behaviourism, cognitivism and constructivism. Within behaviourism, learning is a result of a change in behaviour based on the repetition of actions (Kyrö 2005). The teaching is conducted in classrooms and based on reproduction without reflection. The disadvantage of such a learning approach is that it is rather a mechanistic process and learners tend to remain passive. Cognitivism is the paradigm which considers knowledge as the result of reasoning or intellectual intuition and learning are based on information memorising. Constructivism is the paradigm according to which knowledge is based on prior experience (Glaser, 1991). As much as entrepreneurship education research has been evolving, some critical views occurred. The main critics address the problems of entrepreneurship education research itself as well as of the development of learning theories (Verzat, et al. 2016). Shortages of entrepreneurship education research are identified as lack of critical approach, lack of research on "why" and lack of explicit learning goals and target methods. The critics are pointing out the directions of new development and perspective in the related research area (Verzat et al. 2016). Based on studies on the impact and outcomes of entrepreneurship education the socio-constructivist approach is providing a better outcome. It is focused on the development of creativity, initiative, metacognitive abilities, collaboration and experimentation (Verzat et al., 2016).

2.4. Consciousness and Consciousness Development

Based on consciousness functions of flexible control, social coordination, integrated representation, informational access, freedom of will and intrinsic motivation (Van Gulick, 2018), the intersection and interrelation of consciousness and entrepreneurship competencies can be found. It makes the topic of the role of consciousness development in excelling entrepreneurship competences worth studying further. But when it comes to consciousness and its definitions, there is no unambiguous explanation. The lack of a unified comprehensive definition of consciousness makes the related research more complex and even more diffused. Present literature on consciousness uses the term "consciousness" in different contexts and meaning, therefore the question of what consciousness refers to is also subject to research.

"Consciousness" is used in literature as a synonym for "mind", for the phenomenology of everyday conscious experience, "self-consciousness", "wakefulness", "knowledge" (Velmans, 2006) or "cognition", "attention" and "awareness". A few consciousness operational definitions circulating in science are (Thomas, 2019): consciousness is the dynamic, integrated, multimodal mental process entailed by physical events occurring in the forebrain (Płonka, 2015); consciousness is what disappears when we fall into a dreamless sleep and what returns the next morning when we wake up (Seth, 2015); consciousness is the awake state in which we have the experiences about which we can report at free will or request (Lamme,2005). A pragmatically relatable definition is that consciousness is the awareness at any given instant, of events happening inside the mind like thoughts, feelings, perceptions and of the objects encountered in the environment that cause sights, sounds, smells, tastes and touch. With the emergence of information processing theory and information integration which is based on the premise that humans process the information they receive, rather than merely responding to stimuli, consciousness can be viewed as the complex structure responsible for the arrangement of and relations between elements of something rather even more complex (Figure 1). That "something rather complex" has already been the contemplation subject of Plato and Descartes. Both considered that the material body interacts with the soul through consciousness, that soul is the source of consciousness and reason, and through the exercise of will, it manifests the body. Only in contemporary philosophical approach (Eccles, 1980), "soul" is replaced with "the self-conscious mind" (Thomas, 2019).

Figure 1: Information Processing Model


Source: adapted from Atkinson and Shiffrin model (1971) and Woolfolk (2017)

In the same way as Plato and Descartes, the explanation on consciousness is proposed by Grabovoi (1999) within the premises of his scientific research, work and practice compiled in the set of literature and patents used for consciousness structuring and development. His proposed teaching and learning methods are based on the concept of four fundamental structures of human being and the world. These structures are soul, spirit, consciousness and

physical body, where the soul is primordial world organising structure which is firm, stable, unshakable, immovable and inviolable. The spirit is the action of the soul; consciousness is the structure which combines informational (non-material, spiritual) and physical realities; the physical body is the material manifestation of the soul. These structures are essential for the fulfilment of two main tasks of human being, to create and develop. Human consciousness structure fundamentally ensures human life in any circumstance, that is, infinite sustainable development as it is set in UN's The 2030 Agenda for Sustainable Development. The said interaction between body, consciousness and the soul is the platform of knowledge acquisition where consciousness is the complex structure containing the cognition as the process of a series of actions taken to achieve a creative result through learning. Therefore, within this study consciousness is defined as the overall complex structure responsible for the arrangement of and relations between various elements such as perception, cognition, learning, knowledge, action, executive control and more elements. The learning is the term used for the process of acquiring skills or certain knowledge. Cognition is defined as the processes within acquiring skills or knowledge is taking place, and includes elements such as thinking, knowing, remembering and problem-solving. Generic and simplified arrangement of the structures and processes involved in information processing is shown in Figure1. The information processing starts with receiving input, then proceeds with the processing the information, and ends with output delivery. Input information is obtained through the senses, where the physical body plays the main role. The information of what is sensed trough physical body passes from sensory memory through the perception to short-term or working memory. The information is then processed and encoded which is identified as learning. It is further transferred as the knowledge to the long term memory. The information can be retrieved when necessary and knowledge can be implemented for executive control over the events and processes or new information processing and development cycle. When considering consciousness development, the existence of certain levels of consciousness is assumed. Morin (2005) identified following levels of consciousness: 1) unconsciousness – defined as being non-responsive to self and environment; 2) consciousness – defined as focusing attention on the environment, processing incoming external stimuli; 3) self-awareness – defined as focusing attention on self, processing private & public self-information; 4) meta-self-awareness - being aware that one is self-aware. He also suggests that the time and complexity of self-information are two important dimensions of self-awareness and meta-self-awareness. Morin (2005) also states that examining past and future aspects of the self and being capable of acquiring more conceptual (as opposed to perceptual) self-information indicate higher levels of self-directed thought. The variables that are shaping levels of consciousness are frequency of self-focus, amount and accessibility of self-related information, and accuracy of self-knowledge (Morin, 2005). Therefore the technologies (in terms of the set of techniques, skills, methods, and processes used in the accomplishment of objectives) and specific methods (in terms of the particular procedure for accomplishing the objective) of consciousness development target mostly these three variables. Mindfulness, meditation, concentration IMAP, ILP are just a few methods of consciousness, but merely cognitive development. Here it is necessary to distinguish cognitive from consciousness development methods. Implementation of the methods of consciousness development is expected to ensure access to higher levels or states of consciousness which enables enhancement of attention, perception, information processing, cognition, and the control of the processes and therefore access to the new development cycle. But how to measure consciousness? There is no evidence in the available literature of such measure being developed for consciousness as the structure. Instead, there are technologies to measure neural correlates of consciousness and brain activities such as neuroimaging, neuroelectric and neuromagnetic technologies (Functional Magnetic Resonance Imaging (fMRI), Positron Emission Tomography (PET), Deep Brain Electrical Stimulation (DBES) and Electroencephalography (EEG), Magnetoencephalography (MEG) and Transcranial Magnetic Stimulation (TMS)). For this study, the entrepreneurship self-assessment tests are found more

applicable for reliable measurement of the impact of the structural consciousness development practice within the education system.

2.5. Entrepreneurship Self-Assessment Tests

A considerable number of tools for measuring the impact of entrepreneurship education on students' entrepreneurial competence have been developed. As the preparation for the launch of the assessment tool for measuring entrepreneurship competence outlined within EntreComp, detailed analyses have been made on existing tools (Bacigalupo et. al., 2016, 2). The analysis has indicated a list of 54 self-assessment tools, out of which 12 have been examined in depth by origin and background, target audience and language, purpose, content and user outcomes. The list of tools is shown in Table 2.

Table 2: Self-assessment tools and competencies addressed

TOOL	Ideas and Opportunities					Resources					Into Action				
	Spotting opportunities	Creativity	Vision	Valuing ideas	Ethical and sustainable thinking	Self-awareness and self-efficacy	Motivation and Perseverance	Mobilising resources	Financial and economic literacy	Mobilising others	Initiative taking	Planning and management	Coping with uncertainty, ambiguity & risk	Working with others	Learning through experience

Youthpass														■	

Source: Entirely adopted from Bacigalupo et. al., (2016, 2)

The tools have been developed by individuals, organisations or consortia from different fields of work (education, business start-up, psychology and youth-work). Only EIT Climate KIC, Get2, Grit Scale and Top360 are designed for general and regardless of age audience. Analysed tools have been designed for assessment of entrepreneurship competence, employability, start-up including personality assessment and reflection on learning and the recognition of non-formal and formal learning. Content of tools is based on the use of question combinations to achieve more credible results. The outcomes are presented in the form of visual outcome diagram and/or explanatory report. When compared by EntreComp areas and competences all tools cover two or more areas (mostly "Into Action" area, while the least addressed is "Ideas and Opportunities"). Coping with uncertainty, ambiguity and risk is the most frequently addressed competence followed by motivation and perseverance and planning and management. Valuing ideas, ethical and sustainable thinking and financial and economic

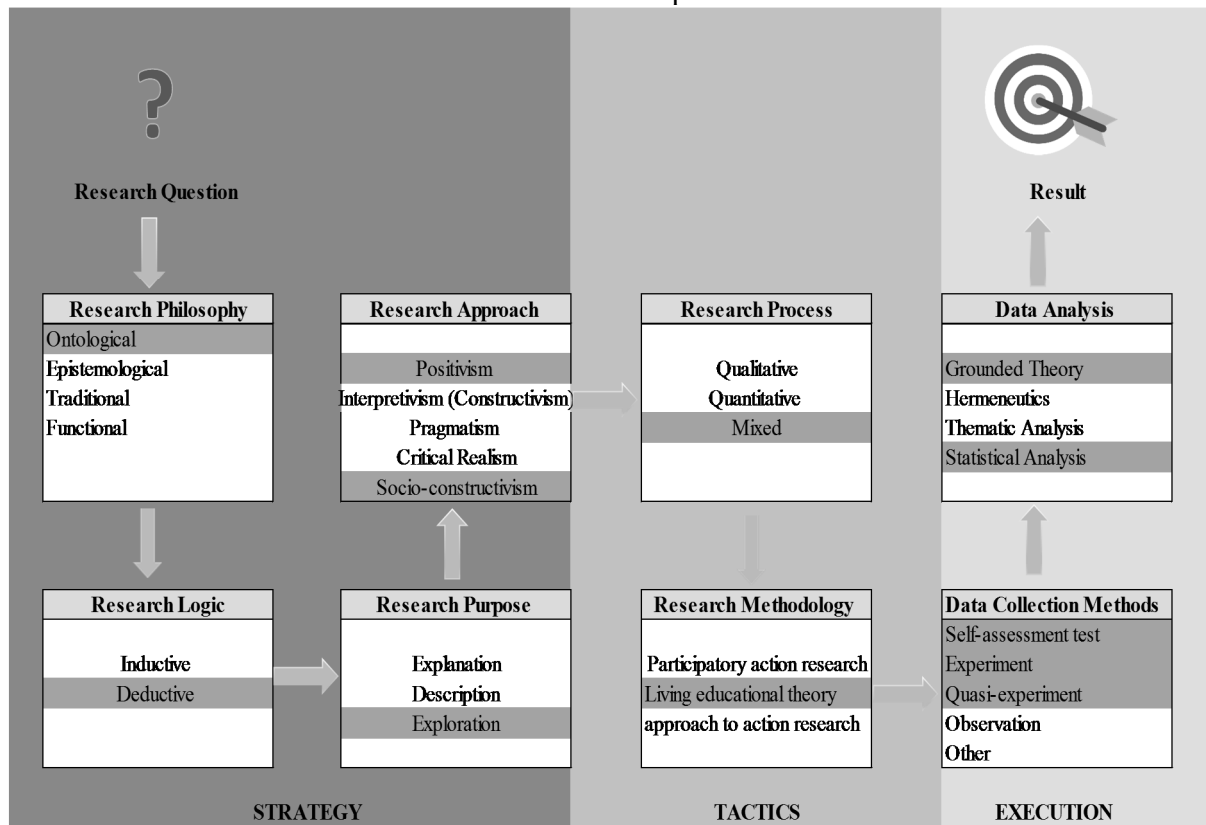
literacy are the least frequently addressed competences. Tools originating from the entrepreneurship education field (ESP, LoopMe, MTEE, Octoskills, and Enterprise Catalyst) cover a broader range of the competencies. Based on the result of the analysis of existing self-assessment tools policymakers were recommended to develop an assessment tool in unison with EntreComp competences. Moreover, the project ASTEE for creation of such an assessment tool has been ongoing since 2012 funded by the European Community, the Competitiveness and Innovation Framework Programme (CIP). ASTEE has been designed to be used by researchers, policymakers and educators (Moberg at al. 2014). This measurement tool has been developed and verified based on pre-studies and pilot-tests to ensure its precision, validity and reliability.

3. Towards Research Design

In a previous chapter, the main concepts related to the role of consciousness in entrepreneurship competence development were discussed. These concepts are entrepreneurship, entrepreneurship competences, entrepreneurship education, consciousness and consciousness development, entrepreneurship self-assessment test. The following conclusions can be made:

a) United Nations' "The 2030 Agenda for Sustainable Development" is the call for global transformation to overcome the world facing challenges.
b) Entrepreneurship is recognised as a possible engine for the transformation of the world and overcoming global challenges.
c) Entrepreneurship is defined as a transversal competence which enables people to actively participate in society, to manage their own lives and careers and to undertake value-creating initiatives.
d) Education is exploring avenues and innovative approaches to foster entrepreneurship competence.
e) Entrepreneurship education objectives are to build an understanding of entrepreneurship and to grow entrepreneurial competence for active participation in society.
f) Entrepreneurship competence is developed through personal transformation.
g) Consciousness is a personal transformation element and its development is subject to education.

Based on the said premises, further research on the role of consciousness in the entrepreneurship competences development by the use of the methods of consciousness development can be proposed. Fore stated the importance of entrepreneurship propagation and entrepreneurship competence generation through formal and non-formal education system is the research problem that future researchers might find interesting to address. The question "what the role of consciousness in entrepreneurship competence development is" needs to be answered not only theoretically, but empirically as well. The diagram of the research design proposal is shown in Figure 2. For the studies in social sciences, it is necessary to take a certain philosophical position since it determines strategy and further course of the research. A proposed study on the role of consciousness development is philosophically positioned in such a way that so-called objective reality, independent of consciousness, does not exist. Therefore, ontological hermeneutics philosophy might be found as the starting point of the research since ontology is the philosophical field oriented to the study of the nature of reality of all that exists and hermeneutics is interpreting the phenomena of reality to be understood.

Figure 2: Research Design for the Role of Consciousness in Entrepreneurship Competence Development


Source: Author

Deductive research logic should be followed in analysis and interpretation since the purpose of the study should be to empirically explore, describe and explain certain existing theoretical premises and assumptions related to the role of consciousness and entrepreneurship education in entrepreneurship competence development. Any of the research approaches can be pursued: positivism, interpretivism (constructivism), pragmatism, critical realism, and socio-constructivism. If the research is conducted in the field of entrepreneurship education then constructivist (knowledge is acquired out of learner's experience) and socio-constructivist (knowledge is acquired out of group experience) approach might be followed since it already showed certain advantages and impact confirmation. On the tactical level, research can be processed quantitatively, qualitatively or within a mixed process. The quantitative process would accommodate the search for the answer to "what" question, and qualitative to "how" and "why". Since here we speak about consciousness as the structure and element of personal and external transformation, action research methodology, oriented towards transformative change through action, matches consciousness functions. Action research could be conducted based on the use of methods and technologies of consciousness development proposed by Grabovoi. Selected methods are based on scientific research and doctoral thesis (Grabovoi, 1999). These methods and technologies are legally protected through patents (Grabovoi, 2000, 2001) and theoretically compiled as education program practised in non-formal education. Previously, the distinction of consciousness as a complex structure responsible for information processing, learning, creation and development have been discussed. Such an assumption is set in the foundations of Grabovoi's methods. The vast volume of his methods and technologies are compiled in the system of knowledge which allows the human through his/her thinking to structure his/her consciousness and attain harmonious control of events. By implementation of the methods and technologies the concentration of consciousness is increased, that is, processed information compactness and volume are increased. Therefore the development of consciousness allows a human being not only to perceive the world in its static phase but also

in its dynamic phase, where all elements of reality exist in dynamics and universal interrelations and therefore are changeable. Reaching the point of extended consciousness one does not limit oneself to perception only, but becomes an active and creative world element with infinite possibilities of safe development. At operative, an executive level of the research, especially in the early studies, the proposed methods and technologies of consciousness development should be exercised in the cross-sectional experimental or quasi-experimental form with pretest-posttest measurements of dependant variables, namely, entrepreneurship competence. Later, longitudinal research could be conducted. The methods of consciousness development should be introduced as an intervention. The participants of the experiment could be both, students and teachers, not only among the population engaged in entrepreneurship studies. It would be insightful to examine the intervention outcome and impact on entrepreneurship competence among students and teachers at any other faculty. The measurement of dependant variables would be conducted by one of the verified self-assessment tests discussed in paragraph 2.5. Since EntreComp covers 15 competencies, not all need to be tested in the initial phase. It might be sufficiently indicative to examine the results achieved on personality traits nominated as predominant for entrepreneurs, and those are creativity, self-efficacy and locus of control. Collected data could be analysed statistically or in other ways appropriate for analysis of data collected by qualitative and mixed research process such as grounded theory or thematic data analysis. Hermeneutic interpretation of the result, irrespectively of being significant or not, would provide a better understanding of the phenomena of consciousness and its role in entrepreneurship competence development.

4. Conclusion

Due to the imperative posed on entrepreneurship competence propagation as the global and personal transformation goal, this study aimed to investigate what the role of consciousness in entrepreneurship competence development is and how and why it can be introduced into education to foster entrepreneurship competence. This study is focused on the identification of appropriate research design to address these specific research questions. To reach the set objective, it was necessary to define main concepts, based on previous research practice and findings. Common understanding has been set on the definition of concepts such as entrepreneurship, entrepreneurship education, and entrepreneurship competences. However, the terminology and definitions of consciousness are significantly ambiguous and therefore the studies on consciousness more dispersed and confusing. Within this study, the consciousness is understood as a complex structure responsible for information processing, learning, creation and development. It is considered to be a changing element not only on a personal level but also the changing element of reality. Specific Grabovoi's consciousness development methods have been presented to be used experimentally in further studies on entrepreneurship competence and related research design has been proposed. The contribution of this study is the merge of two divergent territories of entrepreneurship and consciousness within the education system to foster entrepreneurship competence through personal transformation. Presented research design is not the only one nor did it exhaust all possibilities of a different configuration of strategy, tactic and execution settings of the future research. It is rather the invitation to researchers to take this, so far, the less explored avenue in study of both, consciousness and entrepreneurship competence or any other phenomena.

DRIVING FORCES OF ENTREPRENEURIAL DECLINE OF MAIN URBAN AREAS IN EASTERN CROATIA: HISTORICAL PERSPECTIVE

ABSTRACT

The paper investigates conditions, causes and consequences of economic and social development of major urban areas in Eastern Croatia for the period between 1900-2020. The aim of the paper is to describe and analyze the economic and social changes in observed period as well as to address the impact of these changes on the levels of entrepreneurial development. At the moment Eastern Croatia is significantly lagging behind rest of Croatia who is also well below the EU GDP average, with the negative trend in last few years. By examining antecedents and consequences of economic and social circumstances that define environment for fostering entrepreneurial activity the paper gives insight into ways of enhancing economic development of Eastern Croatia. Productive entrepreneurship needs suitable business environment and lack of such environment creates barriers to the functioning of SMEs in one hand, and leads to problems with corruption, at the other hand. In this paper we tackle the issue by chronologically examining four major influences that led to today's aggravating features of the economic development of urban areas in East Croatia: corruption, depopulation, lack of vibrant and dynamic urban areas and finally a high relative discrepancy in educational levels in respect to more developed areas which leads to the lack of knowledge necessary for a more significant economic development.

Key words: *East Croatia, entrepreneurship, economic development, social development, economic history.*

1. Introduction

The development of Croatia, in terms of difference between its regions, is uneven. The eastern and southern parts of the country have a significantly lower level of development as well as the dynamics of development compared to the western and northern parts. One of the factors of this phenomenon could be interpreted by the environment, that is, the positive influence of the more developed countries than Croatia in the west and north, Slovenia, Austria, Italy, as well as the proximity to Western Europe. If one considers the problem of development from the national point of view, then it is necessary to define the key factors that affect the lower level of

development in the eastern region in respect to western part of Croatia. The purpose of this paper is to propose and analyze the key factors that adversely affect the trend of economic development of the eastern part of Croatia. By analyzing most important research outputs as well as the reports of the national statistics and the reports of EUROSTAT, it can be concluded that corruption and education are crucial factors of development of any national economy. Furthermore, by analyzing historical underpinnings of developments of European economies from the recourse of economic sociology, we propose that the size of cities is also an important element of industrialization and urbanization of Europe, and similarly of Croatia. Accordingly, the aim of this paper is in the valorization of key factors that influence the development dynamics of Eastern Croatia. As a research hypothesis, it is argued that the historical heritage, level of education, size of cities as economic hubs and especially level of corruption are the key influences on the development of Slavonia

2. Historical aspects of development of Eastern Croatia

Throughout history, Croatia has significantly changed its borders and functioned first as conglomeration of several principalities that were by no means other than the ancient royal heritage that was lost in 1102AD. In the 15th century, its borders were significantly shifted to the west and its area was the smallest. Similar things happened with Dalmatia, which was also changing its borders, losing territories and changing its principals in a dramatic manner. In the north of present-day Croatia, for centuries there were two principalities, Banska Hrvatska and Slavonia, that had certain level of unification only from 1558 to 1681.

Since 1681, all three councils have been linked in one with the full name "Congregation of the Kingdom of Croatia, Dalmatia and Slavonia" (Congregatio Regnorum Croatie, Dalmatiae et Slavoniae), and this name remained until 1918. However, despite this unity in the Triune Kingdom, present-day Croatia consists of a number of provinces that frequently changed their principals. Of course, highest intensity of turmoil was to be found at the bordering provinces such as Slavonia. Regardless of the fact that Slavonia was partly developed from agriculture point of view in the time of industrialization of Austro-Hungarian monarchy, necessary invests in terms of the traffic connections roads, especially railways, did not take place in the needed extent.

During the short period of the first appearance of industrialization in Croatia, at the end of the 19th and the beginning of the 20th century, the first small production facilities were formed. That is, while the industrial nucleus (Hobsbawm, 1987) (England and France, and after beginning of the 19th century, Italy and Germany) were developing large scale factories, the first workshops began to open in Eastern Slavonia. These were mostly crafts and manufactories with a small number of workers. First factories began to appear in the first half of the 20th century. It should be emphasized, however, that Slavonia continued to be predominantly agricultural, noting that in Banska Hrvatska and Slavonia, from Zagreb to Osijek, estates were increasingly fragmented over time, which did not allow for a significant development of industrial practices in agriculture. The fragmentation of estates was not diminishing, which was further inhibiting industrialization of Slavonia agriculture.

Despite the fact that agriculture had a high share in the structure of the Croatian economy, the 20th century witnessed beginnings of industrialization that took place in urban centers, especially in Zagreb, but also in Osijek, as well as in small urban settlements of Eastern Slavonia. An analysis of the economic development of Croatia and Slavonia indicates that the development took place unevenly and at a much slower pace than in the countries of the Austro-

Hungarian and Austrian empires (Karaman, 1972). For example, Osijek is associated with silk production, a mill steam engines, factory production of matches, an oil factory, as well as a textile manufacture. The smaller urban settlements of Eastern Slavonia were also in the process of industrialization, and in 1890 the Chamber published a list of enterprises, steam engines and workers distributed in five industries.

Table 1: Industry in Slavonia in 1890

Industry	Number of companies	Steam engines		Workers
		Number	HP	
Wood industry: 7 steam sawmills 7 factories of wood products	14	19	1.035	1.594
Chemical industry: 5 tannin factories 1 matches factory 1 gas factory	7	27	1.796	1.160
Construction industry: 2 cement factories 2 steam brickyards	4	6	442	917
Mill industry: 10 merchant stationary mill factories	10	14	477	190
Other industry: 4 tool factories 3 glass factories 2 leather factories 1 hemp factory 8 breweries 2 printing factories	20	11	80	558
UKUPNO	55	77	3.830	4.419

Source: Karaman, I. (1972). Privreda i društvo Hrvatske u 19 stoljeću, Školska knjiga, Zagreb, p. 169.

It can be concluded that in the late 19th and early 20th centuries, Eastern Slavonia was in the process of nurturing its industry, but this process depended on financial support as well as market demands of centers of Austro Hungarian Monarchy. In this regard, it should be noted that in Osijek in 1867, after many efforts, the Osijek Savings Bank was founded, and then a bank aimed at supporting the development of Eastern Slavonia. Important issues concerning another factor of development, market connectivity, was the construction of railway lines. Unfortunately, the investment in development of rail transport, which was dominant way of industrial transport in the late 19th and early 20th centuries, was too large for the monarchy as well as for domestic investors. Out of the 286 km of railways built in Croatia in the period from 1860 to 1870, the lines that were of interest to Eastern Slavonia was the line Erdut - Dalj and Osijek - Villany in the length of 56 km (Stipetić, 2012). Since alternative ways of transport were needed, the river traffic that connects the important port of Sulina in Romania with Vienna was developed (Karaman, 1972).

The difference between development of western and eastern parts of Croatia can be observed by comparator of industrial potential of Zagreb and Osijek as showed in Table 2.

Table 2: Number of joint stock companies and their capital in 1910

Cities and counties	Number of joint stock companies	Capital in mil HRK (Croatian Kuna)
City of Zagreb	18	8.891
City of Osijek	7	8.206
Croatian counties	19	14.849
Slavonia counties	14	19.157
Total	58	51.103

Source: Karaman, I. (1991): Industrijalizacija građanske Hrvatske (1800-1941) Naprijed, Zagreb, p. 35

As can be seen from Table 2, the city of Osijek as well as the Slavonia counties, despite its numerous issues, primarily its poor connection with the western market of the Monarchy, coped well in respect to larger city of Zagreb. However, after World War I, Zagreb began to develop faster than Osijek, and this difference would continue to increase after World War II, in the former communist Yugoslavia.

After the Second World War and in the time of communist Yugoslavia, a politically controlled economy and forced industrialization were implemented. Its apparent results were positive in the case of the eastern counties of Slavonia, but the negation of the market and its regularities took a toll on the broken Yugoslav economy, as well as the economy of Osijek and eastern Slavonia counties. This situation was very visible in the case of education, especially from the fields of economics and law, as it focused on the quasi-scientific concepts of a not-for-profit socially agreed economy which consequently gave rise to underperformance in business conducted under market mechanism and omnipresent corruption.

Entrepreneurial activity is what drives economic prosperity. Before we go on with our proposal of reasons for economic situation in East Croatia we will take a look at the current state of affairs regarding development of entrepreneurship in Croatia and East Croatia especially as described by the Global Entrepreneurship Monitor in their annual publication GEM 2018/2019 Global Report (Bosma, Kelley, 2019).

According to the Global Entrepreneurship Monitor (Exhibit 1) major problems of Croatian entrepreneurship can be found in areas of culture and social norms, internal market burdens of entry regulation, government policies and entrepreneurial education in post-school stage. Key factors that determine dynamics of economic development as described in this paper tackle these burning issues of entrepreneurial development.

Exhibit 1: Expert ratings of the entrepreneurial framework conditions - Croatia and GEM average

Source: Bosma N. Kelley D. (2019). Global Entrepreneurship Monitor 2018/2019 Global Report, GEM. p. 75

Focus of this paper is Eastern Croatia which is for years now falling behind rest of Croatia. According to the recent Global Entrepreneurship Monitor survey for Croatia (Singer, Šarlija,

Pfeifer, Oberman Peterka, 2018) Eastern Croatia has the last rank for entrepreneurial activity in 2017 (Table 3).

Table 3: Development profiles of regions in Croatia, 2017

Region	Development index		GDP pc 2015		Unemployment 2017		Entrepreneurial activity 2017			
	%	Rank	EUR	Rank	%	Rank	New entrepreneurial activity		Motivational index	
							TEA	Rank	TEA Opportunity/ TEA Necessity	Rank
Zagreb and surroundings	155.34	1	13 422	1	8.1	5	9.9	2	2.6	2
Slavonia and Baranja	29.26	6	6 668	6	19.8	1	5.1	6	0.9	5
Northern Croatia	52.88	5	7 795	5	12.93	4	8.8	4	1.4	4

Source: Singer, S., Šarlija, N., Pfeifer S., Oberman Peterka, S. (2018). What makes Croatia a (non)entrepreneurial country? GEM Croatia 2017, CEPOR – SMEs and Entrepreneurship Policy Center, p. 67

In order to suggest ways to change the situation we need to understand the reasons why the entrepreneurial situation is at this level, that is we need to define crucial driving forces that led to current level of economic development.

3. Key factors determining dynamics of economic development Eastern Croatia

We argue that the key factors determining dynamics of economic development of Eastern Croatia are: size of cities as economic hubs, population and their level of education and influences of law governed social structures approximated with the level and importance of corruption.

3.1. Role of urbanization in economic development of Slavonia

The first and then the second industrial revolution, which began in England and soon spread across Europe, where tied with the development of larger urban areas. Civil society and the new civic order benefited to the developed of the middle class social strata, especially in large cities. Agriculture, which in all European countries was a structurally dominant industry, was on the one hand industrialized, and on the other it gradually lost its primacy in the structure of developed national economies. The decline in agricultural development, which entailed the diminishing the importance of villages, gave way to the development of large cities in which industrial production developed. Thus, large cities have become a main factor in the economic development of each country.

UN estimations are that from 1950 to 2050 on the global scale, number of people living in cities relative to those living in villages will be inverted (Exhibit 2).

Exhibit 2: Estimated proportion of people living in cities from 1950 to 2050

Data Source: United Nations, http://esa.un.org/unup/p2k0data.asp
According to the definition of sustainable urban development researchers: "In essence, the city is a socio-economic entity of high concentration of production and living factors composed of the mutual integration of the natural, artificial, and socio-economic environment" (Xiangsheng, Li, Wang, 1998, pp 429-430).

The city therefore can be understood as a space where there is a high concentration of all factors of life, noting that these factors as well as human needs are changing over decades. It should be noted here that in the less developed communities, cities become factors of a high degree of local patriotism, that is, of glorifying the beauty and value of the city where one lives, which adversely affects national integration. In other words, national integration is an important component of modernization and a factor of wider business and cultural activity, that is, national integration is a process of overcoming localism (Gross, 1985), which is of utmost importance for the development of Croatia. Therefore, the question remains as to the relationship between the size of urban settlements and the economic and overall development of a country or a larger region, such as Slavonia.

The pace of urban development has been accelerated over last decade, raising the issue of the sustainable life of people on earth, in which the village is almost non-existent. Hence Swilling (2016) notices that "For the first time in human history, most of us live in urban settlements - from megacities of 10-20 million, of which there were 28 in 2014, to medium-sized cities of 1-5 million (417 in 2014), and smaller settlements (525 of between 500,000 and one million people in 2014). Looking ahead, the largest growth will not occur in megacities but these small- and medium-sized cities" (Rockefeller Foundation, 2016). Especially interesting is Swillings anticipation of the process of population decline in large mega-cities and the development of smaller cities, between 500,000 and 1 million inhabitants.

What are the consequences of these issues for Croatia and for Slavonia. Firstly, at a time when the size of cities was a key component of industrial development, there were no suitable cities in Croatia that would drive economic development from that perspective besides partly Zagreb. Therefore, for foreign investors, Croatia, and especially Eastern Slavonia, remained only as a source of needed resources, but not as a market that provides significant profits. Even local

entrepreneurs were mostly focused on survival rather than accelerated development. Opportunities in Croatia were therefore below the minimum size of cities compared to the dynamics of the development of the nucleus, but also of the Monarchy, which consequently hindered economic development of these areas.

Table 4: Size of cities of *nucleus*, periphery and Zagreb from 1800 to 1940

Cities	1800	1850	1900	1910	1940
London	1,011,157	2,286,609	5.896.175	7,157,875	7,987,936
Paris	<1.000.000	>1.000.000	Ø4.000.000	Ø4.500.000	Ø5.700.000
Berlin	172,132	446.000	1,888,848	2,071,257	4,338,756
Rome	-	Ø190.000	422,411	518,917	Ø1.300.000
Vienna	271,800	551,300	1,769,137	2,083,630	1,770,938
Zagreb	7.706	16.036	61.002	79.038	Ø 230.000
Warsaw	63.000	163.000	686.000	Ø800.000	1.300.000

Data source: public domain

In such a constellation of strengths of cities, it is obvious that Croatia, and especially Slavonia, were far behind. The share of the agricultural population of Croatia in 1820 was 89%, and in 1921 it was 73% (Karaman, 1972). At the same time, all countries in the Monarchy had a smaller rural population, which meant that they had faster industrial development. In 1910, for example, the Czech Republic has 32% and Lower Austria only 18% of the rural population (Gross, Szabo, 1972; Stipetić, 2012). So at a time when the size of cities was a key factor in the development of industrialization, as well as development in general, Croatia had almost no cities.

3.2. Depopulation as a factor of economic development of Slavonia

Throughout the history of Slavonia, development opportunities have been very limited due to the small number of inhabitants, and lack of larger urban areas. For example, in 1851 Croatia and Slavonia (excluding Dalmatia) had a population of 880,981, at 18,300 km2, and in 1880 1,194,415 inhabitants at 23,278 km2. Therefore average population density was 57 people on km2 in 1851 and 51 st/km2 surface in 1880 (Szabo, 1987). The reason for diminishing of population was also emigration in Vienna in 1873 due to the financial crisis, as well as mortality, especially of infants, which grew due to lack of health staff. Croatia and Slavonia were, both demographically and economically, just slightly more developed than Dalmatia, marked the overall Croatian environment as backward. The economic crises that came from the monarchy (the collapse of the stock market in 1873), illnesses and a high mortality rate affected the displacement of Slavonia and thus the population of cities. In the second half of the 19th century, Croatia had only 10 cities with more than 10,000 inhabitants. At the end of the 19th century, specifically in 1890, northern Croatia had 17 cities (according to the statute criteria) and 71 settlements with more than 2,000 inhabitants but less than 10,000. Twenty years later, in 1910, the number of cities and their population did not change significantly. As regards industrialization and labor, in the period from 1900 to 1910, the number of workers in enterprises with 21 or more than 500 workers in operation nevertheless increased by 63.3%. Thus, the development of the workers' movement took place in the cities, and thus the industrial perspective in Slavonia, especially Osijek, grew rapidly. Structurally, in the years 1900 and 1910, workers accounted for over 55% of the workforce in 1910 plants. Conditionally, the "big" cities assumed economic primacy at the beginning of the 20th century, with Zagreb employing 19.5% of the population of Croatia and Slavonia in 1900, and 29.1% in 1910. Large cities

therefore have higher levels of population growth while small cities are slowly growing or stagnating and some settlements are disappearing.

As it can be seen from Table 4 four biggest Croatian cities have constant growth of population

Table 5: Four biggest Croatian cities in respect to number of inhabitants

Year/city	Zagreb	Split	Rijeka	Osijek
1857.	38 898	37 806	48 216	36 047
1869.	44 930	42 355	51 397	45 013
1880.	56 459	45 931	55 077	43 691
1890.	70 595	50 603	67 633	48 790
1900.	98 322	58 212	81 309	55 912
1910.	121 363	64 414	97 029	65 430
1921.	153 448	71 550	90 529	67 716
1931.	242 063	86 124	102 609	80 116

Source: Korenčić, M., 1979.: Naselja i stanovništvo Socijalističke Republike Hrvatske, Republički zavod za statistiku SR Hrvatske, Zagreb

Zagreb, as the largest city, also has the highest dynamics of growth. In other words, in the period of 74 years (1857-1931) Zagreb achieved an average annual growth rate of 2.5%, while Split and Osijek achieved an annual growth rate of 1.1% and Rijeka 1.0%. At the same time, Croatia has an average annual population growth rate of just 0.7% over the same period, which indicates a lag of smaller cities and towns compared to large cities. Such a trend has continued to this day, so from 1931 to the last census in 2011, Zagreb achieved an average annual population growth of 1.5%, Split an increase of 0.9%, and Osijek and Rijeka only 0.4%, or 0.3%. During this same period, the population of Croatia averages an annual growth rate of just 1.16% (DSZM 2011).

Furthermore, considering GDP as the most representative indicator of economic development, the 2015 Croatian Chamber of Commerce analysis shows very similar results to the population movements in Croatian cities. In other words, for years, Zagreb has consistently generated about 70% of Croatia's GDP per capita, while Osijek-Baranja County has achieved 20% less GDP than Croatia's average. Certainly, Osijek, as the largest city of Slavonia, plays a big role in this. Earlier research has shown the importance of cities for the development of Croatia, with Slavonia clearly behind. Namely if we look at cities in particular regions (regardless of the size of the city) then they as a whole of cities in a particular region have achieved an efficiency index in this order: (1) Western Croatia cities (108.1) (2) Central Croatia cities (101.5), (3) cities of Southern Croatia (100.9), (4) cities of Northern Croatia (99.4) and (5) cities of Eastern Croatia (95.3) (Crkvenac et al, 2008).

Therefore, it is indisputable that the development of Croatia takes place and is based in cities, with the fact that the only size of Zagreb meets the above defined criteria of faster further development of cities between 500,000 inhabitants and 1 million. For now, Osijek is lagging behind, and other cities smaller than Osijek need to look for their own models and development paths, such as Vukovar.

3.3. Education as a function of economic development

Today, just the case was in history, connection between education and the labor market bears in large extent the old misconception that "science is one thing and practice another". From historical perspective Croatia and Slavonia fell into the country with the largest number of illiterate population in the Monarchy in the middle of the 19th century. The male population in 1869 was 75% totally illiterate and 88% were illiterate, and in 1880 there were 67.9% of illiterate men and 79.9% of women (Gross, Szabo, 1992).

Table 6: Main occupation in year 1880 and literacy in year 1869 in Croatia and Slavonia

Main occupations in 1880 %					Literacy % (1869)			
a. CROATIA	Intelectual	Agriculture	Employed house help and others	Rentiers	Reading and writing	Only reading	Completely iliterate	Σ
Cities	10,95	24,32	57,98	6,75	44,97	0,75	54,28	100
Σ Counties	0,71	91,36	7,17	0,76	10,76	1,42	87,82	
b. SLAVONIA								
Cities	11,69	8,54	74,5	5,27	52,87	0,78	46,35	100
Σ Counties	1,18	84,35	14,02	0,45	12,22	0,76	87,02	100

Source: Szabo, A. (1987): „Demografska struktura stanovništva civilne Hrvatske i Slavonije u razdoblju 1850-1880., Historijski zbornik, god. XL (1) str. 221., Gross, M. & Szabo, A.: „Demografski društveni procesi, Globus, Zagreb, str. 44., 51.i 72.

The current state of development of this segment of the development of the society, which is a prerequisite for economic development, can be approximated by the level and quality of today's education, about which, especially for the past several years, there is a lot of disputes. In the European Commission's Education and Training Monitor EU analysis 2018 study analyzing and comparing the most important challenges facing EU education systems in Croatia, 3.1% of young people aged 18 to 24 given up from schooling, which is an increase in compared to 2.8% in 2014, but it is significantly lower than the EU average, which stood at 10.6% in 2017 (Hruska, Luković, 2019).

In such environment, education becomes a crucial obstacle in economic development as well as an indirect factor of social and economic problems such as corruption and nepotism. As a result of a high degree of inadequate knowledge, the Croatian economy is operating in the absence of a stable and efficient economic system.

3.4. Corruption and its influence of economic development

Since the beginnings of organized human life, corruption has been its attendant phenomenon. Corruption is often associated with poverty, but it is still, to a greater or lesser extent, represented in all economies. Corruption is considered to be a social and economic problem, with profoundly negative consequences.

Therefore, the question remains how and to what extent corruption restricts economic development, especially in transition economies such as Croatia. Firstly, Croatia as a new country had to organize its institutions from scratch which is in any context hard and long term process. Each process, at its inception, has a phase of chaos, and this is especially true of the period of formation of new states and economies. For example, all countries born after World War II went through the chaos of birth as the first developmental stage, but that phase should not last long. If, however, the chaos phase lasts too long, corruption becomes a factor of the national economy, which, in the phase of state consolidation and economic growth, needs an organized fight against it, above all political. Croatia is an example of too long consolidation, transition and chaos, which in recent years has resulted in more frequent research and demands to prevent it.

The phenomenon of corruption in Croatian society is mainly viewed in the criminal law context. In recent years, however, special attention has been paid to the phenomenon of economic corruption. There is undoubtedly a strong increase in the interest of domestic and especially foreign economists in researching the impact of corruption on a number of macro and

microeconomic indicators, such as: GDP per capita, economic growth rate, investment, shadow economy, foreign direct investment, public expenditure, and more. Of course, not only can the impact of corruption be explained by the movement of particular economic indicators, but such a causal link cannot be fully explained without understanding this relationship.

In the last two to three decades, the number of authors studying the impact of corruption on economic growth has increased. Thus, Baumol (1990) studied a particular form of rent-seeking corruption and chronologically argued its negative impact on economic growth. Barro (1991) and Brumm (1999) reached the same conclusions. Murphy, Vishny, and Schleifer (1993), on the other hand, have studied structure of different remuneration models of manufacturing employees, as well as those involved in certain forms of rent-seeking. The authors conclude that rent-seeking has a negative impact on economic growth. Furthermore, Cole and Chawdhry (2002) surveyed companies with a lobbying mandate in public administration, analyzing their numbers with respect to the size of a particular economy. Of course, they also found that rent-seeking has a detrimental effect on economic growth, but it also has a detrimental effect on public investment and public services. Moreover, Baumol (2004) concluded in his later studies that rent-seeking influences the strengthening of one part of the economy, that is, the part related to non-productive activities.

The detrimental impact of corruption on economic growth has been confirmed by a number of other authors, such as Shleifer and Vishny (1993) who have conducted and published interesting research conducted in Russia, the Philippines and Africa, concluding that corruption is an important cost to society. The negative impact of corruption on economic growth is also confirmed by Sachs and Warner (1997), Mauro (1996), Brunetti (1997), Ehrilch and Lui (1999), Kaufmann, Kraay and Zoido-Lobaton (1999), Leite and Weidmann (2002), as and Gyimah-Brempong (2002), Neeman, Paserman and Simhon (2004), Welsch (2004), as well as Pellegrini and Gerlagh (2004).

In his research, Mauro (1995) highlighted the negative impact of corruption on investment. Louis (1996) offers the same opinion, but with the risk that the negative impact of corruption is related to the long-term growth rate. Especially important from our perspective is the results of Méon and Sekkat (2005) research, which concludes that central government inefficiency is the main reason for the negative impact of corruption on economic growth. Also Aidt, Dutta, and Sena (2008) came to the similar conclusion that the level of institutional quality is the main reason for the negative impact of corruption on economic growth, that is, in countries with high levels of institutional quality, corruption has no effect on economic growth. Although, in their research of EU transition economies, Abed and Davoodi (2002), disagree with this conclusion.

In this part of the paper we are focusing on the relationship between corruption and economic growth in Croatia, with an emphasis on eastern Croatian counties.

Croatia, as an economy in transition, is susceptible to corruption and so far it cannot find a way organize its economic and legal system, in which corruption would, if not prevented, be at least high risk for the perpetrators. In such unfavorable conditions, corruption seems to have become part of the entire state system, which directs the problem towards political power, as discussed by Mo, Méon and Sekkat (2005), as well as others.

Table 6 shows results from Corruption Perception Index (CPI) according to the Transparency International. Perception of corruption in transition counties is relatively high. Out of all EU transition economies, Estonia has the lowest corruption index. The macro-European region of Baltic states is the place where Europe's strongest and most cooperative economies in transition are found. This collaboration is based on a logical life attitude, which is that it is not good to have a poor neighbor if you are rich because it always implies trouble. As one can see, Denmark,

Finland and Sweden are leading European and world economies in terms of eliminating corruption, while Austria is historically significant in the 9th place in the EU

Table 7: Corruption Perception Index (CPI)according to the Transparency International data from 2008 to 2018

Countries	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Notice: higher index signifies lower level of perceived corruption
Source: Transparency International.

What can be concluded from Table 6, regarding Croatia is that, Croatia has been and still is at the very bottom of Europe. The question remains whether and how high level of corruption is affecting economic development of Slavonia.

Changes in GDP from 2000 to 2016 for Croatia and two most eastern Croatian counties can be seen in Table 8.

Table 8: GDP dynamics from 2000 to 2016

Croatia 2000-2016	Corruption Perception Index (CPI)	GDP per capita (US $) Constant prices	Ø GDP EU (US $)	GDP Croatia EU28 = 100	GDP Osijek Baranja County EU28=100	GDP Vukovar Srijem County EU28=100	GDP Town Zagreb EU28=100

Source: WEO

As can be seen from Table 6, over the 17-year period, the GDP per capita in Croatia doubled, which is certainly positive. Positive developments can also be deduced from the share of realized GDP per capita relative to the average of 28 EU economies, and in 2016 Croatia achieved 61% of the EU average. So, if this dynamic were to continue at this pace, Croatia would be at 100% of the EU average in about 50 years, which is certainly very depressing. It should be emphasized that the Croatian structural index is based on the good results of Zagreb, which since 2006 exceeds the European average and maintains it continuously in the range of 4-11% higher than the EU average. The Osijek-Baranja County with 48.2% and Vukovar-Srijem County with 35.8% of the EUas average in 2016 are among the least developed counties in Croatia. The growth dynamics of the Osijek-Baranja and Vukovar-Srijem counties, if they were to continue at this pace in the future, would hardly ever reach the European average.

Considering the correlation between corruption and economic growth, it can be concluded that in Croatia is present, so called "East Asian paradox" as researched by Rock and Bonnett (2004), which predicates that economic growth depends on the development of corruption. That is, when the central government is inefficient, it becomes the main reason for the negative effect of corruption on economic growth, as stated by Mo, Méon and Sekkat (2005). In other words, the level of institutional quality bares the biggest influence in respect to the negative impact of corruption on economic growth, as pointed out by Aidt, Dutta and Sena (2008).

In order to further discuss influence of corruption on economic development of Slavonia we have conducted regression analysis on Croatia as well on two most eastern Croatian Counties, namely Osijek-Baranja County and Vukovar-Srijem County.

Table 9: Regression Results Corruption and GDP per Capita in Croatia 2000 – 2016

Variable	Descriptive Statistics				
	Valid N	Mean	Minimum	Maximum	Std. Dev.
Corruption Perception Index (CPI)	17	41,35	34,000	51,00	5,442
GDP per capita (US $) Constant prices	17	11293,06	4970,000	15892,00	3373,641

Dependent: GDP per Capita R = 0,51262300; F = 5,346773; R2= 0,26278234; df = 1,15No. of cases: 17; AdjustedR2= 0,21363450; p = 0,035372; Standard error of estimate:2991,6522390; Intercept: -1847,931604; Std.Error: 5729,192; t(15) = -0,3225; p = 0,7515; CPI b*=0,513

As shown by the correlation coefficient (0.513), the lower the corruption, expressed in the higher CPI, the higher the GDP per capita, and this correlation is relatively strong over the observed period of 17 years.

Exhibit 3: Corruption and GDP per capita in Croatia (2000 – 2016)

Corruption and GDP per Capita in Croatia
Y = 32,0142+0,0008*x
Source: authors

The results for Osijek Baranja County are slightly higher than results for whole Croatia.

Table 10: Regression Results Corruption in Croatia and Osijek Baranja County EU28=100

Variable	Descriptive Statistics				
	Valid N	Mean	Minimum	Maximum	Std.Dev.
Corruption	17	41,35294	34,00000	51,00000	5,442210
Osijek Baranja County EU28=100	17	45,11176	37,70000	52,00000	4,334438

Dependent: GDP Osijek Baranja County; EU28=100; R = 0,52336384; F = 5,658588; R2= 0,27390971; df = 1,15; No. of cases: 17; Adjusted R2= 0,22550369; p = 0,031087; Standard error of estimate: 3,814542635; Intercept: 27,874528302; Std.Error: 7,305076; t(15) = 3,8158; p = 0,0017; CPI b*=0,523

As shown by the correlation coefficient (0.523), the lower the corruption, expressed in the higher CPI, the increase in GDP per capita is achieved, and this correlation is relatively strong over the observed period of 17 years.

Exhibit 4: Corruption and GDP per capita in Osijek Baranja County (2000 – 2016)

Corruption and % Osijek Baranya County EU28=100
Y = 11,709+0,6571*x
Source: authors

Finally regression results for Vukovar Srijem County show somewhat lower results than Croatian average.

Table 11: Regression Results Corruption and % Vukovar Srijem County EU28=100

Variable	Descriptive Statistics				
	Valid N	Mean	Minimum	Maximum	Std.Dev.
CPI	17	41,35294	34,00000	51,00000	5,442210
% Vukovar Srijem County EU28=100	17	34,10000	29,40000	39,00000	2,674416

Dependent: GDP Vukovar Srijem County; EU28=100; R = 0,32206021; F = 1,735893; R2= 0,10372278; df = 1,15; No. of cases: 17; Adjusted R2= 0,04397096; p = 0,207430; Standard error of estimate: 2,614956536; Intercept: 27,555188679; Std.Error: 5,007797; t (15) = 5,5025; p = 0,0001; CPI b*=0,322

As shown by the correlation coefficient (0.322), the lower the corruption shown in the higher CPI, the increase in GDP per capita is achieved, but in the case of Vukovar Srijem County this relationship is relatively weak, especially in comparison with Croatia and Osijek Baranja County.

Exhibit 5: Corruption and GDP per capita in Vukovar Srijem County (2000 – 2016)
Source: authors

From the presented research we can conclude that there is a high degree of correlation between corruption and GDP per capita growth in Croatia and Croatian counties. Yet, as the regression results show, corruption has a greater impact on GDP per capita in larger cities and counties, as opposed to smaller ones. Nevertheless, regardless of the differences in the degree of impact of corruption on GDP per capita, it is a significant impediment to the economic development of Slavonia.So, it is necessary to make very clear and dynamic changes in the whole national economic system, which unfortunately still do not exist, especially in the area of local government.

4. Conclusion

From all of the above, several important conclusions can be drawn regarding the condition and perspective of Slavonia, seen in the connection between the four key elements of entrepreneurial development.

Firstly, GDP growth in the eastern Croatian counties, with the leading cities of Vukovar and Osijek, is ongoing, but compared to the EU average, this dynamics is very slow, i.e. the Osijek-Baranja County would reach the European level in about 55 years, and the Vukovar-Srijem region never. Croatia, as a whole, so the Adriatic and Continental counties would reach the European average in 50-60 years.

The cities of Osijek and Vukovar are unable to provide sustainable development dynamics, at least not within the sustainable development of European cities, because they are too small. The city of Zagreb, from that perspective, is the only Croatian city that can provide the appropriate dynamics of sustainable development, given its size.

Corruption in Croatia, viewed through the Transparency International (TI) Index (IPK), is gradually decreasing, which is certainly good. Unfortunately, corruption is observed at the national level, not at the county level, but it can be concluded that corruption, with a low level of county development, has a detrimental effect on their development. Comparison of the movement of the corruption index and the share of the realized GDP in relation to the EU average breaks down to somewhere around 2008 when the corruption index with 44 was the highest in the previous 9 and the next 3 years. This positive effect was also accompanied by GDP relative to the EU average, indicating a high degree of connection between corruption and economic development.
